CURRENT METAL PRICES.

AUGUST 8, 1888.

The following quotations are for small lots. Wholesale prices, at which large lots only can be bought, are given elsewhere in our weekly market reports.

IRON AND STEEL.

Bar Iron from Store.

Common Iron:	
1 to 2 in. round and square.	1/2 lb 1.90 @ 2.00
1 to 6 in. x 1/2 to 1 in.	
Refined Iron:	
1/2 to 2 in. round and square.	1/2 lb 2.10 @ 2.25
1 to 4 in. x 1/2 to 1 1/2 in.	
4 1/2 to 6 in. x 1/2 to 1 in.	
1 to 6 in. x 1/2 and 5-16	1/2 lb 2.30 @ 2.45
Rods—1/2 and 11-16 round and sq.	1/2 lb 2.20 @ 2.35
Bands—1 to 6 x 1-16 to No. 12.	1/2 lb 2.30 @ 2.45
"Burden Best" Iron, base price.	1/2 lb 3.00 @
Burden's "H. B. & S." Iron, base price.	1/2 lb 2.80 @
"Ulster"	1/2 lb 3.10 @
Norway Rods	4.00 @ 5.00

Merchant Steel from Store.

Open-Hearth and Bessemer Machinery.	
Toe Calk, Tire and Sleigh Shoe, base price in small lots.	2 1/2 @ 3
Best Cast Steel, base price in small lots	3 1/2 @ 4
Best Cast Steel Machinery, base price in small lots.	5 1/2 @ 6
For Classification and Extras adopted by the Merchant Steel Association of the United States, June 1, 1888, see The Iron Age, June 21, 1888.	

Sheet Iron from Store.

Common American.	R. G. Cleaned.
10 to 16.	1/2 lb 2.75 @ 2.80
17 to 20.	1/2 lb 2.85 @ 3.00
21 to 24.	1/2 lb 3.00 @ 3.10
25 and 26.	1/2 lb 3.20 @ 3.30
27.	1/2 lb 3.35 @ 3.75
28.	1/2 lb 3.50 @ 4.00
B. R.	2d qual.
Galv'd, 14 to 20.	1/2 lb 4.50 @ 4.80
Galv'd, 1 to 24.	1/2 lb 4.87 1/2 @ 4.75
Galv'd, 25 to 28.	1/2 lb 5.25 @ 5.12
Galv'd, 27.	1/2 lb 5.62 1/2 @ 5.48
Galv'd, 28.	1/2 lb 6.00 @ 5.85
Patent Platinized.	1/2 lb A 10 @ B 6
Russia.	1/2 lb B 2 1/2 @ 10
American Cold Rolled B. B.	1/2 lb B 4 @ 7

English Steel from Store.

Best Cast.	1/2 lb 15 @
Extra Cast.	1/2 lb 16 1/2 @ 17
Swaged Cast.	1/2 lb 16 @
Best Double Shear.	1/2 lb 15 @
Elster, 1st quality.	1/2 lb 12 1/2 @
German Steel, Best.	1/2 lb 10 @
2d quality.	1/2 lb 9 @
3d quality.	1/2 lb 8 @
Sheet Cast Steel, 1st quality.	1/2 lb 15 @
2d quality.	1/2 lb 14 @
3d quality.	1/2 lb 13 1/2 @

THE IRON AGE

THURSDAY, AUGUST 16, 1888.

The Beck Automatic Engine.

One of the later results in the line of automatic engine building is the Beck engine, turned out by the Taylor Mfg. Company, of Chambersburg, Pa., according to the diagrams of Mr. Robert M. Beck, su-

line, thereby overcoming the objection that is sometimes raised against the single disk or side-crank engine.

Fig. 1 represents a perspective view of the engine from the crankshaft end, showing the oil-guard surrounding the crank-disk and governor, as well as a part of the

outer edges. The forward steam port exhausts directly out of the cylinder, and the back port through the inside of the valve. An attachment of especial value is the automatic relief valve rigging, which is shown attached to the under side of the valve chamber (see Fig. 5), consisting of a

Fig. 1.—General View.

Fig. 2.—Longitudinal Section.

NEW HIGH SPEED AUTOMATIC ENGINE, BUILT BY THE TAYLOR MFG. CO., CHAMBERSBURG, PA.

perintendent of the works. The engine embraces a number of new features, and is the outgrowth of a careful study of what is required for an automatic engine to properly meet the requirements of modern electric lighting.

The engravings which we give on this page, as well as on the two pages following, will help to a better understanding of the nature of the design. The engine is secured to a very heavy cast-iron bed, which is anchored to a foundation, and forms a substitute for cap-stone and brick. This base makes the engine self-contained and renders it impossible to get out of

latter in position on the shaft. It shows, also, the position of the oil-cups on the main bearings, eccentric and crank-pin. All the cups are large, so as to avoid frequent filling, and have a very simple arrangement for setting at any feed desired.

Fig. 2 is a sectional side elevation, showing the full interior and the manner of connecting, from which a very clear idea of the valve arrangement can be obtained. Live steam entirely surrounds the valve, which is perfectly balanced, and the admission to the cylinder is accomplished by the inside edges of the valve head, or rings, the exhaust being controlled by the

valve connected to each steam port, with a cam, B, and a lever, C, between them, to which the valve stems I are connected in such manner that one movement of the lever opens and closes the valve. A spiral spring ingeniously arranged on the valve stems automatically relieves any sudden accumulation of condensation from priming of boilers, or other causes. The valves are also provided with a thin cap, H, that will break and relieve the cylinder of condensation should the valves fail to afford sufficient relief, thus doubly insuring against accident from accumulation of water in the cylinder. The valves are pro-

vided with a butterfly stop, J, that can be closed when the cap breaks, allowing another one to be put in its place without the serious disadvantage of having to stop the engine. There is also a relief valve attached to the hollow stud G which carries the cam and lever B and C, communicating with the live steam section of the valve chamber to carry off condensation from the steam pipe and chamber before admitting steam to the cylinder. All the waste is conveyed into the main exhaust pipe.

The engine bed is of the trunk-girder type, very heavy and rigid. The steam passages are large and direct. The valve is of the hollow piston class, and works in bushings secured to the valve chamber in such a manner as to be easily removed in case of wear. New ones can thus be readily inserted. The valve rings are independent of the valve barrel, being ground on to it and held by a follower, the same as packing rings on a locomotive piston. There is thus perfect freedom of action, irrespective of expansion or over-

which movement is not sensibly resisted by the oil, except in case of sudden action; consequently all jumping of weights and racing of engine are prevented, making a very important feature where close regulation is required, as in electric-light plants. So perfect is the control over the steam and sudden changes of load claimed to be that the throttle-valve can be instantly thrown wide open, admitting full head of steam in starting the engine, and the motion of the engine will increase to full speed as evenly and smoothly as if regulated by a gradual opening of the throttle. The eccentric is connected directly to the valve, so that its action is instantaneous, admitting steam to piston at full boiler pressure, varying the point of cut-off as resistance requires from its beginning to three-fourths stroke. The heavier the load the less the lead and compression, and when the engine is running without a load the lead and compression is so arranged that smooth and easy action of engine is assured. The governor is reversible, to

springs, reducing the throw eccentric, and causing a corresponding reduction in the admission of steam, thereby preventing an increase of speed. The prompt action of the regulator in controlling the speed proves a very important factor where the engines and dynamos are being run in pairs and it becomes necessary to shift the load. In changing the load from one engine to another the speed of the engine remains constant, thus obviating the difficulty following the load.

The engine is built in sizes varying from 20 to 227 horse-power, the cylinder dimensions varying from 7 x 8 to 18½ x 24 inches. Where it is desired only one band-wheel is used, the face being made to receive a belt in proportion to the power to be delivered. The engine is already extensively in use driving Edison illuminating plants with highly satisfactory results.

Charles Brunner, of Peru, Ill., has just completed a building of two stories, 170 feet long and 60 feet wide, with an "L"

Figs. 3 and 4.—Governor Details.

NEW TAYLOR HIGH-SPEED AUTOMATIC ENGINE.

traction. The crank-shaft and crank-pin are of steel. All bearings have liberal wearing surface. The piston is fitted with an effective special style of self-adjusting packing, which runs with very little friction. The piston rod is of steel, and is screwed into the cross-head. It is secured by a jam-nut and locking screw. Metallic packing is used in all packing boxes.

The governor, shown more in detail in Figs. 3 and 4, is simple and effective. Its action on the valve is instantaneous and positive. The full throw of the eccentric is accomplished with less than an inch movement of the weights, so that extreme variation of loads from nothing to the full capacity of the engine cannot, it is claimed, cause any appreciable variation in the speed, there being only a slight change in the speed of the weights, necessary to move them through so short a distance. Stiff springs and moderately heavy weights are employed, producing a decidedly prompt action of eccentric. A very important device is used in connection with the springs and weights, which overcomes all racing of engine. By its use a very sensitive adjustment of springs and weights can be made, and perfect regulation of speed obtained. This attachment is a vane which revolves in a closed case filled with oil, and is attached to the eccentric by a toothed rack and pinion. The movement of the weights propel the vane in the oil,

run either over or under, and can be adjusted for any speed within 10 per cent. either way, and should any part of it break the eccentric will close off the steam, preventing the engine from "running away." The governor is independent of the band-wheel. The latter can thus be moved on the shaft to bring it into alignment with the pulley to be driven, and the trouble of having oil flying over the belts is avoided.

The springs act by compression. In Figs. 3 and 4 A represents the eccentric, pivoted to the arm of the wheel B at C; D is a sleeved arm that revolves on the limb of the wheel B, and is connected to the eccentric by the pin E. The weighted lever F is pivoted to the rim of the wheel B at G and by means of links H to the arm D. The weights are secured to the lever F, and, owing to centrifugal force, act on the eccentric through the arm D. The vane case is marked J, and is secured to the arm of the wheel B, with toothed wheel in position, and connected directly to the eccentric by the rack K. The springs I, as already remarked, act by compression, and when the load of the engine is increased they overcome the centrifugal force of the weights, and increase the throw of eccentric, which admits more steam, and holds the engine to a constant speed. As the load of the engine becomes lightened, the weights act against the

extension of 40 feet. The entire outer walls are constructed from "fire-proof tile," manufactured by the Pioneer Fire-proof Construction Company, of Chicago. The ground floor will be used for an office, machine shop and the scale finishing department. The top floor will be utilized for drawing-room, pattern-room and carpenter shop. He is now engaged in tearing down and remodeling his foundry, so that his floor space will be fully again as large. This building when completed will be 60 x 100 feet, one story high, and well lighted and ventilated. The walls will be of fire-proof tile and the roof of asbestos. He employs about 70 men the year round, but when all improvements are made will increase his force to perhaps 100. Mr. Brunner is delivering his second order of eight boilers to the Spring Valley Coal Company, 75 horse-power each, making 22 in all that he has built for this company in the last three years. He is also at work on four flue boilers, 54 inches in diameter, 28 feet long, 75 horse-power each, for coal mines in Montana. His scale department is busy on railroad scales, some of them for the same coal companies, and he also has booked numerous orders for his portable Acme and wagon scales from various parts of the West. He has recently built a number of fan engines and special machinery for mines in Illinois and other Western States. As soon as he can

get his new machinery in place he will commence the manufacture of a line of novelties in calesthenics.

Torpedo-Boat Riveting.

In view of a recent report touching the defective riveting of an English first-class torpedo boat, which became apparent while on a voyage to China, the *London Engineer* of May 11 directs attention to the method of riveting best suited to such vessels, in which, as is known, the thinnest possible plating is adopted for the sake of lightness:

The universal practice in shipbuilding, remarks our contemporary, is to put the rivet through the plates from the inside of the hull, and hammer down on the outside. In the case of torpedo boats or any lightly plated vessel an outside countersink clearly cannot be deep, and it is in this countersinking that the weakness of riveting thin plates together really lies. Although, from the high standing of the builders, we do not for one moment attribute defective workmanship as the

Steamship City of New York.

The Inman steamship *City of New York* is the latest addition to the Atlantic fleet, and her achievements on her first trip over from Liverpool show that she is a wonderful vessel. According to the log she steamed 2794 nautical miles in 6 days and 21 hours, deducting for 8 hours 59 minutes, during which, on August 3, she was hove to while the circulating pumps were being repaired and for a few other minor delays. This makes an average speed of about 16.93 knots per hour for the entire actual steaming time. The ship left Queenstown on August 2, passing Roche's point at 8.41 p. m., Irish time, and she cast anchor off Sandy Hook at 3.43 a. m., New York time, 10th inst. Her daily runs were as follows: Beginning August 3, noon, 271, 168, 382, 420, 441, 425, 446, 241. Seventy revolutions per minute was as high a rate of speed as was attempted, and 85 per minute is the rate which she is expected to reach in the future. The highest run of the *Etruria* is said to have been 502 knots. The *City of New York*, it is predicted, will make 520 knots within the next two or three trips,

per dust, which is obtained by shaking a solution of sulphate of copper with granulated zinc. The temperature of the solution rises considerably and the metallic copper is precipitated in the form of a brownish powder—20, 30 or 36 parts of this copper dust, according to the hardness desired, are placed in a cast iron or porcelain lined mortar and well mixed with some sulphuric acid having a specific gravity of 1.85. Add to the paste thus formed 70 parts (by weight) of mercury, constantly stirring. When thoroughly mixed the amalgam must be carefully rinsed in warm water to remove the acid and then set aside to cool. In 10 or 12 hours it will be hard enough to scratch tin. When it is to be used it should be heated to a temperature of 700° F., when it becomes as soft as wax by kneading it in an iron mortar. In this ductile state it can be spread upon any surface, to which, as it cools and hardens, it adheres very tenaciously.

The Berrenberg Rotary Pump.

A new rotary pump, known as the Berrenberg pump, has recently been brought out in Boston, the makers being the Boston Rotary Pump Works, 46 Oliver street, and the selling agents, Messrs. Gould & Lord, 82 Water street, both of Boston.

The peculiarity of the pump lies mainly in the pistons, each piston being a circle, from which four small semi-circular sections have been cut. In two of the semi-circles, opposite each other, tubes are bolted through from the semi-circular spaces left vacant. When the pistons revolve the tubes for boxes, as they are called, of one piston fit into the vacant spaces of the other piston with perfect accuracy, and the circumferences of the pistons being always in contact with each other there is at no time in the course of their revolution any chance for much leakage. Moreover, there is no grinding of gears, but an easy and comparatively frictionless and noiseless motion. As all the lines of the working parts are circles, it is claimed that they can easily be built to fit with greater accuracy than any other form. Another great point of advantage is claimed to lie in the fact that, in case of wear from long service, they can readily be made as good as new by simply removing the tubes or boxes and putting a few thicknesses of paper packing in the seat, or else by turning the tubes a little so as to present a new surface to the point of contact with the case. The pump will also pump equally well either one way or the other, and, in case liquid containing mere or less solid matter—such as sand, tan or dirt—is to be pumped, by connecting the suction pipe at the top and the discharge at the bottom, and running the pump the other way, good results are claimed, all solid matter being carried through without clogging. The pump is double-gear, and has inside and outside bearings, so as to take all possible strain off the pistons. The outside bearings are taper bearings, so that any wear in bearings or shaft may be taken up and the shafts always kept true. It is claimed, further, that owing to the circular form of the pistons the pump can be run at a high speed with little friction and noise. This feature of the pump renders it particularly well adapted for use in connection with electric motors, for running elevators, pumping in mines and other places where an electric motor can be used to advantage. The pump was awarded a silver medal at the exhibition of the Massachusetts Charitable Mechanics' Association in Boston, in 1887.

O. W. Potter, president of the North Chicago Rolling Mill Company, sailed from New York for Europe on the 8th inst. to take a month or two of needed rest.

Fig. 5.—Automatic Relief Valve Rigging, Taylor Engine.

cause of the leakage in No. 35, still we think it may rather be looked for in the system than from any other cause. In our issue of the 13th ult. we illustrated a torpedo boat built by Messrs. Yarrow & Co. for the Chinese Government, and in Admiral Lang's report of the voyage out, during which very heavy weather was encountered, he states: "Every one who saw her must have great confidence in her strength, as I found on her arrival that she had not strained in the least, and had not leaked a drop of water." Owing to this fact we would draw attention to the mode of riveting adopted by the builders of this vessel. Instead of passing the rivet in from the inside and hammering down on the outside, as usual, they have rivets specially made with countersunk heads, these being passed through the plates from the outside and hammered down inside, which admits of a fairly substantial head being formed, because in this case the head need not be flush. By this plan a definite amount of countersink is insured, because it is far easier for the workman to countersink the hole so that the head fits well in than to file off that portion of the head which otherwise would project. Moreover, a countersunk head made out of the solid is far more trustworthy than if formed by being hammered down cold. On the other hand, if the rivet is hammered down on the outside, in order to make the surface smooth, it often happens that very nearly all the head is ultimately filed off, and in reality little or nothing is left to hold by.

but is not expected to develop her full speed until she shall have made a number of voyages. The *Etruria*'s best record was not made until she had been running several years. The builders have contracted to produce a vessel which shall have 20,000 horse-power, which shall run upon an average 20 knots an hour, and which shall under heavy penalties in the form of fines be able to cross from land to land in 5 days and 15 hours.

The cost of the *City of New York* is something over \$1,750,000 or £350,000 sterling. Her owners receive a subsidy from the British Government of \$50,000 a year for the privilege of being able to take the vessel in the event of war. Besides this the revenue from the English mails amounts to \$90,000 a year for the whole line. For the sake of completeness in noticing this initial trip of the *City of New York* we repeat the figures heretofore given in these columns, showing her general dimensions. She is 565 feet long over all, with a breadth of 63½ feet. She is 42 feet deep. From the bottom of the keel to the top of the captain's bridge is 70 feet, the height of many a good business block.

A New Soft Solder.—According to a current paragraph a soft alloy which adheres so firmly to metallic, glass and porcelain surfaces that it can be used as a solder, and which is invaluable when the articles to be soldered are of such a nature that they cannot bear a high degree of temperature, consists of finely pulverized cop-

Fire Risks of Electric Lighting.

M. Mascart recently performed before the French Physical Society a number of experiments illustrating the possible dangers of fire from electric light. In introducing the subject, he stated that it was necessary in electric light installations to take precautions against the undue heating of the conductors, and to avoid the risk of materials being ignited by the heat generated in the lamps. In the case of insulated wires laid beneath moldings, the heat generated was generally dissipated by conduction which kept down the temperature of the wire and its covering. But an excessive current might destroy the insulation and inflame the wood. An experiment was made with a wire of 1.2 mm. in diameter, laid on a block of wood and covered with another block. This wire would, in ordinary practice, carry a current of 4 ampères, but in this experiment a current of 40 ampères was passed before it commenced to carbonize the wood. With a much greater current the wood was inflamed at a point where the wire was uncovered, as between the boards the lack of air prevented ignition.

In order to see what amount of danger was to be expected from the lamps themselves the following experiments were made: 1. The globe of an arc lamp was covered with several thicknesses of a light fabric of green tulle. 2. A glow lamp of 32 candle-power was covered in a similar manner, the folds of the fabric being pressed on the lamp by an india-rubber band. 3. An incandescent lamp was covered with a cotton hood. 4. A glow lamp was covered with a similar hood of black silk, which was surrounded by another of velvet. 5. A lamp was covered with a layer of white wadding, the gummed surface of which had been removed. 6. Two glow lamps were covered with layers of wadding, white in one case and black in the other. 7. A lamp of 32 candle-power was placed in a vertical fold of an old theatrical scene; and finally, 8, a lamp of 300 candle-power was laid on a similar scene. In cases 1, 2, 5 and 7 no carbonization nor excessive heating was caused for 20 minutes. In case 8, the scene commenced to carbonize without flame at the end of 1½ minutes, and at the end of 2 minutes the envelope of the lamps in 5 burst into flame, and in about 6 minutes the velvet calotte in experiment 4 commenced to burn slowly; this experiment was prolonged without breaking the lamp, but the globe was deformed. The cotton hood in 3 was partially carbonized at the end of 10 minutes, but was not set on fire.

Paper Tests.—It has often been stated that the cause of paper becoming brittle or tender is to be found in the presence of alum or sulphate of alumina in the paper. Herr C. Wurster's observations, according to the *Papier Zeitung*, extending over ten years, tend to the conclusion that neutral or basic sulphate of alumina exercises no decomposing influence at ordinary temperatures on paper, whether size be present or not, but that sulphate of alumina has a strong caustic action if chlorides, such as those of sodium and calcium, be present, especially at higher temperatures. In this case an injurious action on the paper arises from the formation of aluminium chloride or free hydrochloric acid, which acts by abstracting hydrogen, or the elements of water, from the cellular substance. The manufacturer should therefore endeavor to remove, as far as possible, by washing from the fabric, any sodium or calcium chloride resulting from the bleaching powder. It is accordingly not advisable to kill the bleach by antichlor without subsequent washing. From these considerations, the testing of paper should include a qualitative or quantitative exami-

nation of the chlorides present, which, the *Journal of the Society of Chemical Industry* says, have hitherto been regarded as quite harmless.

The Cost of Rolling Wire Rods.

In response to the suggestion of the Finance Committee of the Senate, during the hearing accorded to the iron rod manufacturers of the United States, Mr. George T. Oliver has submitted the following statements of costs of rolling wire rods at the works of the H.P. Nail Company, the Braddock Wire Company, the Oliver & Roberts Wire Company, Limited, and the Gautier Steel Department of the Cambria Iron Company:

Cost of making Steel Wire Rods in 1887 by the H.P. Nail Company, Cleveland, Ohio.

	Gross ton.
Labor in and around rod mill.....	\$4.53
Material for supplies, repairs, coal and water.....	2.57
General expense—traveling, office, taxes and insurance.....	.60
Waste, less value of scrap.....	1.75
Interest on plant.....	.50

Total cost.....\$9.95

The item "material for supplies," &c., is practically mostly labor which is put on by other parties. The "general expense" item is principally expenses paid for traveling, which is labor. I believe the actual labor in making a ton of rods from billets amounts to at least \$7.50, for what is coal or iron worth without the labor put on them? Nothing.

Statement of Braddock Wire Company's (Rankin, Allegheny County, Pa.) cost of Manufacturing No. 5 Steel Wire Rods from 4-inch Square Billets, June 1, 1887, to June 1, 1888.

	Gross ton.
Labor, rolling account.....	\$4.23
Wear and tear.....	.75
Interest at 6 per cent. on investment, on basis of 20,000 tons output per annum.....	.47
Expense account.....	.96
Fuel and supplies.....	.85
Basing steel at \$30 per ton net, furnace and rolling waste at 8 per cent.....	2.61

Total cost of producing No. 5 wire rods.....\$9.86

Statement of Oliver & Roberts Wire Company, Limited, Pittsburgh, Pa.—Cost of Manufacturing No. 5 Wire Rods during the Fiscal Year ending January 31, 1888.

	Per ton.
Labor and superintendence.....	\$4.15
Waste (after deducting returns from scrap, &c.).....	2.49
Maintenance, supplies and fuel.....	1.05
Taxes and interest.....	.85

Total.....\$8.54

Average cost of billets (4 inches square). 31.72

Cost of rods.....\$40.26

Cost of Manufacturing Wire Rods at the Rod Mill of Gautier Steel Department, C. I. Co., November 1, 1886, to November 1, 1887.

Billets consumed, 8610 gross tons, at an average price of \$33.65 per gross ton.....	\$289,862.52
Operating.....	\$37,478.67
Maintenance.....	11,834.09
	49,312.76

Total cost.....\$339,175.28

Less value of scrap.....2,522.11

Net cost.....\$336,653.17

Total product, 7960 gross tons. Average cost, \$42.29 per gross ton.

It will be observed that the cost of rolling rods at the latter mill is, therefore, \$8.64 per gross ton, exclusive of interest.

The Telephone in Siam.—The activity with which the Germans are pushing their trade into foreign countries receives many practical demonstrations. One is furnished by the consular report of Mr. Jacob I. Childs, United States consul at Bangkok, Siam, who writes as follows: "The plant for the telephone at Bangkok has arrived from Germany. I am informed by an electrical expert conversant with telephonic affairs that the instrument is much inferior to the American instrument, costs about five times as much, and has not near the power of the Bell; but as the control of

the matter was in the hands of a German who has a friend at court, no one else was consulted in the matter, and he had the power to do as he pleased. As it is, the Germans are getting a strong hold here with the officials, which is somewhat galling to the English and French residents, who in the past had a monopoly of the business."

Licenses for Engineers.

Referring to the recent agitation in England to get an act of Parliament passed to make licensing of engineers compulsory, the *London Engineer* says:

There are practically no boilers in charge of men utterly ignorant of their management, while the fact that so long as a boiler has water enough in it it is very difficult to blow it up, may be taken as contributing to the safety of steam users and their neighbors. The whole weight of the arguments for and against the granting of certificates turns on these points, and it is not without interest to note the entire absence of all data of a trustworthy character intended to prove that boilers are, under the existing system, persistently intrusted to men quite ignorant of their duties. Practically the whole argument is based on a theory and emanates, with a few exceptions, from men who are quite in the dark concerning the conditions under which steam is made in this country. It may do some good if we put the facts before them in the simplest possible way.

In the first place, we have to eliminate boilers in steamships and locomotive boilers; these are always put in charge of men whose knowledge is not for a moment in doubt. We have next to do with boilers in mills, and here again there can be no question of competence raised. Boilers in iron works and at mines are, with very rare exceptions, in charge of engineers who certainly know all about them; so we may eliminate them. There remains, then, nothing but the little boilers found in small sawmills, brickworks and so on, and portable and traction engines and crane engines. Concerning the last we may say again that they are never put in charge of men who do not know how to manage them, sometimes they know too much. It is doubtful if the small stationary engines ever get into wholly incompetent hands. Engine drivers and firemen, even of the lowest type, go through some sort of training as lads before they are permitted to take charge of a boiler. If the numbers of wholly untrained men who, according to the advocates of the certificate system, must be in charge of boilers was as great as is stated, then there ought to be about ten explosions for each one of which we have now. As we have said, the whole theory is based on a fallacy; at all events, that is what the available statistics go to show.

Wood Pavements.—These pavements have met with greater success in Europe than in America, because they are laid upon a foundation of concrete, and receive more attention in the way of maintenance than is given them here. American yellow pine, owing to its hardness and resinous quality, has been the favorite wood in Berlin and Hamburg. A report from Berlin states that the Fredericks bridge was paved in March, 1879, with yellow pine and is still in a good condition, while the approaches, paved with granite blocks, have since required twice repaving. The Opern platz in front of the Emperor's palace was paved in 1882 partly with yellow pine and cypress at the point where the traffic is greatest. At other points stone blocks were used and were laid at the same time. To-day the area having the wood pavement is the one which is best preserved.

New Steam Wrecking Pump.

We show on this page a new steam-pump for wrecking purposes, built by Messrs. Goulds & Austin, of Chicago, Ill. It is of the centrifugal pattern, and has an enormous capacity, the 12 size, with 14-inch suction and 12-inch discharge, being capable of raising 12,000 gallons, or say 400 barrels, per minute. As seen in the cut, the driving-engine is placed on the same frame as the pump, the frame being of wrought iron and the whole outfit being mounted on wheels. Connection with the pump is direct. The shaft having heavy thrust-bearings and the piston being guided above and below with

steel bridge, 220 feet long, and ample in size to accommodate any amount of traffic. The bridge was built and paid for by the North Chicago City Railway Company. The old Wells street bridge was removed the latter part of March, and work on the new improvement was commenced shortly afterward. The work has been done very quickly, considering the size of the bridge.

New Iron and Steel Warehouse at Chicago.

Early in 1887 a description was published in these columns of a new warehouse, which had been built at Chicago for the

tracks extending in front and immediately in the rear of them give direct connections with every road running out of Chicago but the St. Paul, and it is easily reached by a connecting line. The first floor in each case is on a level with the car floors, which facilitates loading and unloading. For shipment by rail the location and arrangement of the warehouses are unsurpassed, while they are also within easy reach of local freight depots for small hauling. Mr. Williams has found in his experience of 1887 and 1888 great advantages accruing from the possession of a warehouse in Chicago carrying large stocks of goods, and in extending his facilities expects to greatly enlarge his trade. Not-

NEW STEAM WRECKING PUMP, BUILT BY MESSRS. GOULDS & AUSTIN, CHICAGO, ILL.

V-shaped guides; there is no lost motion or unnecessary friction.

These pumps are usually furnished with from 20 to 30 feet of suction-pipe in short pieces, or with a slip-joint so as to adjust the suction to vessels having different depths of hold. In case of a wreck a tug carrying one of these pumping rigs is sent to the scene, and after the vessel is raised to the surface the pump and a boiler are transferred from the tug to the wreck. The pump is, at present, built in four sizes, numbered 6, 8, 10 and 12, but larger sizes can be furnished according to specifications.

Two new swing bridges over the Chicago River in the heart of the city of Chicago are about completed. One is at Eighteenth street and one at Wells street. Both are built of steel and both are the work of the Keystone Bridge Company. The Eighteenth street bridge cost \$83,300 and the Wells street bridge cost \$59,000. The latter is one of the finest bridges on the river. It is a double roadway, steam

Hartman Steel Company and the Apollo Iron and Steel Company by Nelson B. Williams, their Western agent. It was supposed at that time that sufficient room would be thus supplied for a considerable expansion of the business of these companies, but it was, of course, not known how rapidly their business would grow. The progress of months demonstrated the necessity of additional room, and a second warehouse has accordingly just been erected by Mr. Williams on the opposite side of Newberry avenue from the old warehouse on the corner of Fifteenth street. The new structure is built of brick and stone, occupies a site 150 feet long by 100 feet wide, and is three stories high. It is very substantially constructed in every respect, being modeled after the first warehouse, which proved to be very satisfactory in enduring the strain of the heavy materials stored in it. There are 79 piers in the new warehouse to support the first floor, each capable of sustaining 200 tons.

The location of these warehouses is most excellent for business purposes. Railroad

withstanding the depression of the past few months the volume of business handled by him has steadily grown, because he has been ready at all times to ship promptly and in any quantity. The full line of products of the Hartman Steel Company and the Apollo Iron and Steel Company is represented in his stock. The office will be continued in the Rookery building on the corner of La Salle and Adams streets.

A corrected statement of the financial position of the Calumet & Hecla Mining Company, on April 30th, is as follows: Assets—Cash at mine office, \$67,127.64; cash at New York office, \$7746.65; cash at Boston office, and copper at 14 cents, \$2,407,449.57; bills receivable at mine, \$31,357.63; total, \$2,513,681.49. Liabilities—Drafts in transit, \$61,139.21; employees' aid fund, \$2348; bills payable at mine, \$146,285.14; bills payable at Boston, \$100,000; machinery contracts, "estimate," \$200,000; new smelting works, \$50,000; total, \$559,772.35; balance assets April 30, 1888, \$1,953,909.14.

The Iron Trade of Cincinnati.

Chamber of Commerce Report.

Through the courtesy of Sidney D. Maxwell, superintendent of the Cincinnati Chamber of Commerce, we have received advance sheets of the last annual report, which Mr. Maxwell has for many years made the model of such documents. We quote from it the following review of the trade:

MANUFACTURED IRON.

The year has been one of great activity to manufactured iron. Throughout the fall and winter and early spring the mills tributary to this city were generally running at full capacity. Profits were not large, yet there was a margin. Prices, too, were somewhat better. There was something of a lull after the warm weather had set in, and prices, in some classes of manufactured iron, were from \$1.50 to \$2 per ton lower. The apprehension of labor troubles, however, notwithstanding largely increased production, served as a check to any general decline, so that the year closed with the feeling that the approaching season would be one of equally favorable conditions, unless disturbed by actual or prospective legislation. At the close of the year Merchant bar iron was quotable at \$1.80 per 100 pounds, for large and desirable orders. Tank iron was quotable at \$2.40, and sheet iron, heavy to light, \$2.50 to \$3, prices having been little better, if any, in these articles at the conclusion than at the opening of the year. Boiler plate iron, once occupying a prominent place in the manufactured product, has been almost entirely supplanted by steel, such as was used having been quotable, at the close, at about \$3 for No. 1 charcoal boiler plate, steel being quotable at the same price.

Allusion was made in previous reports to the increase that had taken place in late years in the use of steel for various purposes for which iron had previously been exclusively used, encouraged by superior quality and by prices that were equally low. In some departments of ironwork it has amounted almost to a complete transformation, with every indication that the encroachment upon manufactured iron has little more than begun. In the matter of boiler plate, the conquest has been so complete as to practically remove such iron, for the usual purposes, from the list of manufactured iron. The receipts of manufactured iron and steel, at this city, in the past year, were the largest ever known, having aggregated 155,885 tons, in comparison with 137,203 in 1885-86, 112,109 in 1884-85, and, approximately, 9202 40 years ago; and the shipments 139,393 tons, compared with 104,311 in 1885-86, 89,745 in 1884-85, and, approximately, 8236 40 years ago.

A very important industrial event of the year has been the determination of parties in this city, of large capital and wide experience, who for years have been prominently engaged in the same business here, to erect iron works for the manufacture of iron pipe and heavy castings on an extraordinarily large scale. The new works have been located on the Ohio River below the city, lands amounting to 108 acres having been purchased, and the improvements already begun. It is the intention of the projectors to furnish the most complete pipe plant in the world, where the best physical results will be attained at the minimum cost. Both railway and water transportation will be available; extensive buildings will be erected; houses for employees provided, and, in general terms, provision made for the most economical administration, and for the establishment of a community of working forces that shall be supplied with everything

necessary to their comfort—the object being to lay the foundations for an enterprise alike valuable to the employer and the employed. The locality is to be known as Addyston, after the public-spirited citizen who has conceived of the undertaking and formulated the plans for the accomplishment of the work. It is well known that iron pipe manufactured here has for years been distributed to almost all parts of the country, and this new project will give Cincinnati a still stronger position in this respect.

PIG IRON.

The year has been one of unusual prosperity to the pig-iron business of the country, the increased activity which marked the preceding year having also continued through 1886-87. The production of the country exceeded any previous year, having been greater than that of Great Britain 17 years ago, and destined eventually not only to reach but pass the output of that great empire of iron production. It is interesting to note that 32 per cent. of this increase in the past year is found in States that are immediately tributary to Cincinnati, these States now producing more iron than was produced in the whole country in 1870. The work of the development of the iron resources of the South has gone on with remarkable activity; the erection of new furnaces of large capacity, backed by ample capital for the prosecution of the work; the activity displayed by furnaces already in operation; the valuable character of the iron, and the evidences furnished from time to time of the wonderful resources of that wide district in this commodity, are all salient features of the time. Closely related as are the Southern furnaces to Cincinnati, whatever, in general, has enlarged their business has also made its impress upon the trade of this city, which, in this commodity, now occupies one of the most conspicuous positions in the country—no other market certainly having such a great variety of irons to present, none being more centrally located, nor provided with ampler means for distribution; none where business is in the hands of men of larger experience, enterprise and financial ability.

The business in the past year shows the largest work ever performed by the trade here, both in tons and aggregate value. The total production of pig iron in the States in which Cincinnati is immediately interested, comprising Alabama, Georgia, Kentucky, Indiana, Michigan, Missouri, Ohio, Tennessee and West Virginia, in the calendar year of 1886, was 1,872,988 net tons, compared with 1,283,247 in 1885 and 716,910 10 years ago. Of the quantity produced in the past year, there were, of bituminous coal and coke iron, 1,529,582 tons, compared with 981,073 in 1885; and of charcoal, 343,406 tons, in comparison with 302,174 in 1885. The total production of pig iron in the United States in the calendar year of 1886 was 6,365,328 net tons, compared with 4,529,869 in 1885, 2,093,236 10 years ago, 1,350,343 in 1866, and 883,137 in 1856. In 1840 the entire production of the country was 286,903 tons. The present product of the country largely exceeds that of the whole world 40 years ago. The sales of pig iron in Cincinnati from first hands, according to confidential returns submitted to the superintendent of the Chamber of Commerce, aggregated in 1886-87 667,773 tons, in comparison with 511,426 in 1885-86, 406,998 in 1884-85, 427,934 in 1883-84, 417,635 in 1882-83, 386,510 in 1881-82, 334,702 in 1880-81, 248,519 in 1879-80, 212,281 in 1878-79, 125,912 in 1877-78, 129,194 in 1876-77, and 137,646 in 1875-76—these figures embracing also iron sold for direct shipment from the furnaces to the places of consumption, alike with such as may have touched this city. It will be observed that the business here in 10 years

measured by physical results has much more than quadrupled.

The quantity of pig iron actually received here shows also an increase over any preceding year, having aggregated 266,005 tons, in comparison with 195,899 in 1885-86, 154,987 in 1884-85, 163,440 in 1883-84, 141,587 in 1882-83, 156,340 in 1881-82, 137,164 in 1880-81, and, approximately, 35,660 in 1866-67, and 15,868 40 years ago. The actual shipments were 203,186 tons, compared with 145,852 in 1885-86, 111,652 in 1884-85, 121,659 in 1883-84, 106,819 in 1882-83, 100,983 in 1881-82, 97,665 in 1880-81, 64,409 in 1879-80, and, approximately, 14,571 20 years ago, and 3462 in 1857-58, which is the earliest published record of the shipments of this commodity. The actual receipts in the past year, it will be observed, have increased over 1885-86 70,106 tons, or about 35 per cent. The increase in one year is thus shown to have been greater than the entire receipts in any year prior to 1871-72, the receipts 20 years ago having been 35,660 tons; 30 years ago, 29,484 tons, and in 1845-46, the earliest record made at the Chamber of Commerce in the movement of this commodity, 13,685 tons, an increase in 42 years of 1843 per cent. The total value of the sales of pig iron in this city in the past year aggregated, approximately, \$14,514,046, in comparison with \$9,737,551 in 1885-86, \$7,667,842 in 1884-85, \$9,307,564 in 1883-84, \$10,060,827 in 1882-83, \$10,698,596 in 1881-82, \$9,006,830 in 1880-81, \$8,708,105 in 1879-80, \$3,463,173 ten years ago, and \$1,760,000 in 1868-69.

The following table shows the annual approximate sales of pig iron at Cincinnati for 19 commercial years:

1868-69.....	\$1,767,000	1878-79.....	4,583,146
1869-70.....	2,469,000	1879-80.....	8,708,105
1870-71.....	2,667,000	1880-81.....	9,006,830
1871-72.....	6,500,000	1881-82.....	10,698,596
1872-73.....	7,062,930	1882-83.....	10,060,827
1873-74.....	3,385,326	1883-84.....	9,307,564
1874-75.....	3,432,348	1884-85.....	7,667,842
1875-76.....	3,463,173	1885-86.....	9,737,551
1876-77.....	183,1743	1886-87.....	14,514,046
1877-78.....	2,875,830		

The year 1886-87 opened under circumstances favorable to increase in the value of pig iron. Stocks of good iron, at the close of the preceding year, were low, foundry grades having been scarce. The condition for months had been preparing the way for a more active demand and better prices than had prevailed, so that during the month of August there was decidedly increased inquiry for pig iron, without, however, any particular impression being made upon prices. Early in October the market was stronger, and prices showed some improvement in stone-coal iron, hot blast charcoal iron soon following in the wake of the advance. No. 1 strong hot blast stone-coal iron, which had been quotable at \$17 to \$18.50 per ton, steadily advanced until reaching \$21.50 to \$23, soon after the advent of the new calendar year, No. 1 hot blast charcoal iron advancing in the same period from \$20 and \$21 to \$24 and \$25.50. Hanging Rock car-wheel iron advanced, in the same period, from \$24 and \$27 to \$29 and \$31. No. 3 foundry iron advanced, from September 1, 1886, to January 1, 1887, from \$14 to \$20, the advance, however, in other grades, as appears from the figures, not having been so great.

After the first of January, there was a noticeable lull in the iron market. The uncertain operations of the Interstate Commerce law, the restless condition of labor, largely increased production in this country, and free importations, stimulated by the higher prices, all combined to throw a feeling of uncertainty over the iron market. Prices remained without quotable change for a number of months, and yet there was a gradual weakening of the tone of the market, which before the close of March began to make itself felt in prices.

No. 1 Northern iron, which had been quotable at \$22.50 to \$23, lost 50 cents per ton at the close of that month. Southern iron yielded somewhat more reluctantly, and yet by the middle of April it had sustained a decline of \$1 per ton. Charcoal irons, about the same time, began to give way in price, the quotation having been lowered \$1 per ton, to be followed by a further decline of 50 cents to \$1 per ton at the close of the month. From this time on until July the market steadily lost ground, No. 1 strong hot-blast stone-coal iron having been quotable at \$19.50 to \$21 during the latter part of May, June and the larger part of July. No. 1 charcoal iron in the same time declined from \$24 and \$25.50 to \$22 and \$23, both irons, it will be observed, having lost about one-half of the advance. Car-wheel iron seemed to hold its position with more tenacity, for, after having advanced to \$29 to \$31, by the middle of April it declined to \$28 to \$30, and remained thence without quotable change until the close of the commercial year. In August the market again showed increased strength, strong No. 1 hot-blast stone-coal iron, both Northern and Southern, having advanced to \$21 to \$21.50, charcoal iron being quotable at \$24 to \$24.50, a part of the loss in value having thus been regained. The advance, however, was destined not to be of long duration. Whatever expectations there may have been that we should witness another period of undue expansion in the values of iron were largely dissipated by the experiences of the year, for, with the largely increasing capacity of our furnaces in the South, and the manifest ability to profitably produce iron at low prices, the conditions were not favorable to enormous inflation of value, with the consequent disturbance to prices, which would inevitably ensue, in almost all kinds of production into which iron enters.

The average quotation for No. 1 hot-blast charcoal iron, in the past year, was \$22.95 per ton, in comparison with \$20.46 in 1885-86, \$20.93 in 1884-85, \$23.43 in 1883-84, \$25.63 in 1882-83, \$28.45 in 1881-82, \$26.91 in 1880-81, \$35.04 in 1879-80, \$21.59 in 1878-79, \$22.84 in 1877-78, \$24.14 in 1876-77, \$25.16 in 1875-76, \$29.28 in 1874-75, \$39.21 in 1873-74, \$55.33 in 1872-73, and \$46.74 in 1871-72. The average quotation for strong No. 1 stone-coal iron was \$20.54 per ton, compared with \$17.96 in 1885-86, \$17.33 in 1884-85, \$20.40 in 1883-84, \$22.82 in 1882-83, \$25.96 in 1881-82, \$23.67 in 1880-81, and \$31.90 in 1879-80, the quotations for both Northern and Southern irons entering into the averages in the later years. The average quotation for No. 1 car-wheel iron was \$28.31 per ton, in comparison with \$25.50 in 1885-86, \$26.41 in 1884-85, \$28.46 in 1883-84, \$30.42 in 1882-83, \$36.50 in 1881-82, \$39.30 in 1880-81, and \$48.83 in 1879-80.

NAILS.

The strike among the nailers having entirely disappeared, the business of the year to the manufacturers of nails was an active one. Stimulated by an advancing market, there was an active demand throughout the fall and winter, 10d. nails in large lots, which had been quoted at \$2.08 in this market, having advanced to \$2.58 by the last of January, when an attempt was made to still further push up prices, which had already attained those prevailing in 1883-84. This, however, proved unsuccessful. There was, throughout the fall and winter, a generally strong feeling, and a great many nails were bought on speculation, there having been during the month of February doubtless the largest business in nails that was ever transacted in this city. After the 1st of April, however, the demand weakened, and a decline set in, which finally carried

10d. nails down to \$1.98 about the 1st of June, the lowest price which had prevailed in this market since 1878-79, and in striking contrast with \$5 per keg, at which such nails had ruled in the midst of the excitement of 1879-80. Late in June prices were advanced to \$2.08, remaining thence without change until the close of the year.

The average quotation for 10d. nails in this market, in large quantities, was \$2.24 per keg, in comparison with \$2.258 in 1885-86, \$2.177 in 1884-85, \$2.46 in 1883-84, \$3.165 in 1882-83, \$3.314 in 1881-82, \$2.819 in 1880-81, \$3.60 in 1879-80, \$2.017 in 1878-79, \$2.226 in 1877-78, \$2.67 in 1876-77, and \$2.797 in 1875-76. The year's work makes the largest showing in the history of the city, the receipts having aggregated 615,867 kegs, compared with 529,511 in 1885-86, 388,025 10 years ago, 331,278 in 1866-67, 112,215 in 1856-57, and 54,918 40 years ago. The shipments were 523,206 kegs, in comparison with 455,959 in 1885-86, 296,014 in 1876-77, 262,517 in 1866-67, and 48,866 in 1857-58, which is the earliest record made of the outward movement of this commodity. A noticeable feature of the time is the tremendous growth in the production of steel nails, which has increased in the whole country from 393,482 kegs in 1884 to 2,968,989 kegs in 1886, with the prospect that in 1887 the production of steel nails in the whole country would exceed that of iron. The entire production of iron and steel nails in 1886 was 8,160,963 kegs, of which the Wheeling district produced 1,858,551 kegs, the present production in this district being almost wholly from steel. Another noticeable feature has been the rapid increase of wire nails, the production in the whole country in 1886 having been about 600,000 kegs, with the promise of the quantity being considerably more than doubled in 1887.

STOVES.

The business in stoves has proceeded without marked changes from the preceding year. The production of Cincinnati doubtless showed increased results, but the year was one in which there was very active competition and slender profits. Early in the spring prices were advanced throughout the country, on certain classes, about 5 per cent., but it was not general in its application to all kinds of stoves, so that, coupled with the difficulty perhaps, in some instances, of even maintaining the advance that was sought to be established, the average increase was inconsiderable. The business of Cincinnati has been well maintained, and yet it cannot be said that the losses sustained by the long period of inactivity produced by the labor troubles of preceding years have been entirely repaired. Much of the lost ground has been regained, and there has been a wider distribution of our wares to the westward, especially to the Pacific Coast.

How the Castle Garden emigrant landing is owned and managed was stated officially by the president of the Emigration Commissioners before the Congressional investigating committee. The property of Castle Garden belongs to the City of New York. The commissioners have also 120 acres on Ward's Island. They have a hospital there. Objectionable immigrants find a resting place there until their cases are decided. The property is worth between \$2,000,000 and \$3,000,000. In 1882 it was decided that the State "head tax" was illegal, and therefore was discontinued. Then the commissioners borrowed \$200,000 from the Emigrant Industrial Savings Bank, giving a mortgage on the property on Ward's Island. Since 1882 the commission has acted as the agent of the Treasury Department, under a contract with the late Secretary Folger. The collector of the port

never acts, the witness said, with regard to suspicious persons unless he is notified by the commissioners. Since 1882 the collector employs his own inspectors in furtherance of the Contract Labor act.

Sale of Graff, Bennett & Co.'s Mills.

The Millvale and Clinton mills of Graff, Bennett & Co., of Pittsburgh, who made an assignment in the early part of the year, were sold at auction by order of the court on Thursday, the 9th inst. The first-named plant is located on the South Side and was built in 1846. It contains 7 double and 19 single puddling furnaces, 11 heating furnaces, 6 trains of rolls and 32 nail machines. The Millvale plant is located on the West Penn Railroad and was built in 1850 and destroyed by fire on December 11, 1881, and was rebuilt in 1882. It contains 10 Danks rotary puddling furnaces, 4 double, 1 double-double and 21 single puddling furnaces, 18 heating furnaces, 10 trains of rolls and one hammer. In 1886 an open-hearth steel plant was erected, containing two 15-gross ton Siemens-Martin open-hearth furnaces. The estimated value of the entire property is \$2,500,000. Unprotected creditors, whose claims amount to over half the indebtedness, appointed James M. Bailey and James W. Friend, of Pittsburgh, and Colonel Pickard, of Cleveland, to represent them, and Mr. Friend did the bidding. Judge Bredin, Thomas Carlin and Mr. Dickey, representing the mechanics' liens of \$50,000 against the mills, were also bidders. The bids ran the price up very slowly by \$250, \$500 and \$1000 bids, until Mr. Carlin bid \$26,000. He afterward withdrew this bid and the Friend syndicate was awarded the property for \$25,050 over and above the mortgages of \$625,000, or a total of \$650,050.

Before the sale commenced Jacob Reese gave notice that the Universal mill, lately in use by Graff, Bennett & Co., was not their property; that they had no right to use it, and that the patents covering it were held by him. Notices were read from the Butler Plank Road Company as to the occupation of part of that road, and also from the West Penn Railroad Company as to the occupancy by the mill of part of the old canal bed, which is now the property of the railroad company. There are many conjectures as to what will be done with the property. James W. Friend stated that the creditors had bought the property merely to protect themselves. Mr. John Graff, a member of the firm, said the amount paid for the property was not near the value. The Clinton mills, which cover 11 acres of ground, were worth twice the amount given, and the Millvale property, which occupies 28 acres of ground, he believes is worth fully four times the amount for which the entire property was sold. It seems to be the general impression that the firm will make some arrangement with the creditors by which they will be allowed to gain possession of the plants again and operate them.

Bids were opened at the Navy Department at Washington on Friday for material for use in the construction of the armored cruiser Maine, at the Brooklyn Navy Yard. The lowest bids for the principal articles were, for hardware, Albert Flagler, at \$9709; for wrought iron, H. B. Newhall, at \$1250; for flat wrought iron, L. H. Ross, at \$1097; for bolts and nuts, H. B. Newhall, at \$1109; for colored paints, W. B. Price & Co., of Baltimore, at \$1185.

During the first six months of the year 54,000 emigrants arrived in Canada, but of this total 40,000 crossed the border.

THE WEEK.

The engineers of the proposed merchants' bridge at St. Louis have made their report and the Merchants' Exchange are deliberating upon the amount that shall be subscribed in their behalf. The estimate for the bridge proper to comprise three steel spans of 518 feet each is \$1,210,000, and the total is put down as \$1,654,000. The total length of the bridge will be 2425 feet, or almost half a mile.

The bill prohibiting the landing of Chinese emigrants in this country, which was introduced in May by Senator Stewart, of Oregon, passed the Senate without a division. Chinese officials, teachers, students, merchants or travelers for pleasure or curiosity shall be permitted to enter the United States, but, in order to entitle themselves to do so, they shall first obtain the permission of the Chinese Government or other Government of which they may at the time be citizens or subjects. Such permission and also their personal identity shall in such case be evidenced by a certificate to be made out by a representative of the United States at the port from which the person named therein comes. The words "Chinese laborers" shall be construed to mean both skilled and unskilled laborers and Chinese employed in mining. No Chinese laborer in the United States shall be permitted, after having left, to return unless he has a lawful wife, child or parent in the United States, or property therein of the value of \$1000, or debts of like amount due him and pending settlement.

The Miners' and Mine Laborers' National Assembly at their annual meeting in Cleveland had before them the subject of resistance to the power of any combination formed against them. The Master Workman's address had the following: "It has become fashionable of late for labor organizations, our own among the number, to cry down and discourage the most effective method, offensive and defensive, that organized labor has, as yet, learned to use to secure their rights; and the method that is employed daily by organized capital with success. Through the medium of their association the operators of the East and West advance the price of coal in the markets 25 or 50 cents per ton, regardless of the consumers' ability to buy. That is 'business,' and the fact is heralded through our great dailies and copied by our labor papers as an evidence that the market is in good condition. The miners, through their organization, advance the price of their labor 5 or 10 cents per ton, and if they refuse to sell it for less it is a 'strike,' and the men who have the hardihood to make such a demand are expected to offer the 'public' an apology for the position they have taken, and are counseled that their only remedy is education. Last month the 'coal pool' struck the consumer for 25 cents advance and struck the miner for 6 cents reduction. If the miner is to be educated out of striking, what is to be done with the operator?"

As an indication of the rapid development of the Argentine Republic, the interesting fact is noted that since January, 1887, new banks have added \$52,500,000 to her banking capital, of which \$42,000,000 have been subscribed by citizens of the Republic. This increase of banking capital has been as great as that of the National banking system of the United States during the same period.

Technical and normal education are subjects that receive considerable attention in the annual report of the superintendent of the New Jersey State Board of Education. Mr. Chapman says: "Newark is the only city which has taken advantage of the law passed in 1881, granting to any city which

raised an equivalent amount an appropriation of from \$3000 to \$5000 for the support of schools for industrial education. The school in Newark has proved successful. Industrial schools have also been started on an independent basis at Montclair and Hoboken."

Coal from Mexican lands between Lampasas and Eagle Pass, in Texas, were tested at the coke ovens in Connellsville, Pa., in the interest of the Coahuila Coke Company, and the result is a belief that there is no longer any necessity for importing the English article at a cost of \$13 per ton. Equally good can be made on the spot for \$3 per ton.

The Dock Commissioners now have at their disposal \$2,000,000, and within two years expect to complete the proposed extension wharf improvements on the site of West Washington market and at other points on the North and East Rivers. Eighteen years ago, and prior to the existence of a Dock Commission, the city received an annual revenue from water-front property of \$300,000; now she receives \$1,300,000. The commissioners, therefore, contend that every dollar expended by them eventually returns a profit of \$2.

Senator Evarts, in an elaborate argument concerning the fisheries treaty, contended that the waters over which Canada claims exclusive jurisdiction are really the high seas, as much so as Baffin's Bay, Hudson's Bay or the Bay of Fundy, and that what is known as the three-mile line is merely a line of deference, a *linea de respectu*, a ribbon, as it were, drawn around the shores with all their sinuosities. No nation, he argued, had a right to exclude other nations from the enjoyment of the high seas, except by the concession of deference. The position which should be taken by this Government was to insist that the United States had always rejected the headland theory, and did not tolerate the claim of right on the part of Great Britain to make a bay by calling it a bay, and to shut out of it American fishermen.

Three hospitals for the bituminous coal miners in Pennsylvania, for which the State appropriated \$60,000, are about to be erected.

The plan of opening the coal and iron regions of Alabama from the sea, by means of a railroad from Mobile, is not only pronounced feasible by engineers, but is considered a safe commercial venture. A director of the proposed road says: "Our plan is to start this line from Mobile Point on the bay and run it direct through the rich coal and iron fields about Birmingham, where we will connect with other lines. At the starting point there is a depth of water of 26 feet, which will easily admit vessels from the Gulf, thus opening a short route from the West Indies to St. Louis and Chicago. The vessels as they land at the point can transfer their cargoes to the cars, and the goods shipped to that point can be easily placed on board the ships."

A second large gas well has been struck in the center of Allegheny's industries.

Another effort is making to resuscitate the Hudson River tunnel, upon which the indefatigable Colonel Haskin is supposed to have expended thus far upward of \$1,000,000. Mail advices report that the Bank of Scotland, as fiscal agent of the Hudson Tunnel Railway Company, of New York, announce that they will receive subscriptions for \$1,500,000 first mortgage 5 per cent. gold bonds of that company, maturing 1939, being part of the first issue of \$2,500,000, the remaining \$1,000,000 being reserved for allotment in the United States. The price of issue is £180 per bond of \$1000. The interest is guaranteed up to and including the coupon of

July 1, 1893, by deposit in the Bank of Scotland. The prospectus sets forth that excepting New York Central, which crosses the river at Albany, all the railways leading to New York from 48 States and Territories terminate at Jersey City, and these are barred from entrance to the city by the river. It is proposed to tunnel by two parallel tunnels, each 5600 feet long, 18 feet high and 16 feet wide, and of this total length, 2580 linear feet have been completed.

The Japanese Government have a novel way of raising revenue without giving offense. It merely intimates that in future, instead of estimating the pound sterling at 4.88 silver *yens*, its value shall be regulated by the three months' rate of drafts, and forthwith the duties are raised about 30 per cent.

Not an American plow was seen in Mexico is the report given by a tourist who has just returned to this country after traveling 2000 miles through that republic. But great changes are looked for soon. When the National Railroad is completed and opened next November one will be able to reach Mexico from New York in 5½ days. The country is full of energetic English, French and German traders, and some Americans.

The proposed new territory of Oklahoma is described as the new land of promise. Congressman Springer says that within two weeks after the passage of the Oklahoma bill the territory will contain a population of at least 100,000 souls. He says fully that number of people are now metaphorically sitting along the border of Missouri and Kansas awaiting the opportunity to enter.

The Holland American Society of New York, numbering 50 members, on its arrival at Rotterdam, was received by the Mayor and leading merchants accompanied by the Rotterdam National Guard, and at Amsterdam it was escorted by an imposing procession.

Herr Most says there are 1000 outspoken anarchists in New York, and 10,000 or 12,000 sympathizers.

The yellow fever plague in Florida is becoming more serious. In Jacksonville, Fla., the situation is grave. The first case there was that of a man from Plant City, and was pronounced genuine by the physicians July 28. August 9 the presence of the disease caused general alarm, and before the week closed probably 10,000 persons fled from the city, several new cases appearing every day. Saw mills and other manufacturing establishments are closing. Disinfectants are being used broadcast, and huge fires of coal tar and pitch pine are kindled to banish the epidemic. The health authorities at Washington City have ordered officers to proceed to Way Cross, Dupont, Hart's Road Junction, Tallahassee and Chattahoochee, and superintend the fumigation of all mails and baggage coming through these places from the South. Surgeon-General Hamilton thinks this will confine the disease to where it is now, and is confident, in view of precautions already taken, there will be no extended epidemic. At New York all suspected vessels will undergo rigid examination.

Gen. Roger A. Pryor, on behalf of Atty.-Gen. Chas. F. Tabor, has filed in the Supreme Court two suits against the sugar trust, with the design of ending its corporate existence. One of the suits is against the individual members of the trust, who are charged as acting as a corporation without being duly incorporated, and with exercising corporate privileges not granted to them. The court is asked to oust and enjoin them from the exercise of such privileges. The other suit is against the North River Sugar Refining Company,

one of the members of the trust. The complaint recites that this company is a corporation formed under the laws of New York, and then sets forth the steps it has taken in entering into the trust. These acts, it is charged, are in violation of the company's charter and an abuse of its franchise. These are test cases, and if successful similar suits will be brought against the other trusts. Defendants in both suits are given 20 days from August 7 in which to answer. New York and vicinity alone produce daily about 25,000 barrels, and the weekly profits of the trust are estimated at \$750,000 to \$1,250,000, or an annual profit of \$40,000,000 to \$70,000,000.

The great timber raft from Joggins, Nova Scotia, has arrived safely at Erie Basin, and the owners, it has been said, will realize from \$75,000 to \$100,000 on their venture. Mr. Leary, by whom it was built, is expecting to build another of still larger dimensions. The first one contained 13,000 logs, but was abandoned at sea in December last. It was announced at the beginning of its construction that the raft would be a "timber ship." On this ground Mr. Leary obtained in Canada some \$6000 worth of chains to be used in its construction. Otherwise he would have to pay a heavy duty on them to the Canadian Government. The raft was admitted at New York duty free.

The dressed beef rates between New York and Chicago were advanced on August 10 to 25 cents and to Boston 30 cents. Live stock rates were advanced 13½ cents to New York, and other rates now cut will also be advanced. This is supposed to be the end of the much proclaimed dressed beef war. If it has served to check the encroachments of differential rate roads upon the lines that are maintaining schedule rates it will have had a salutary influence.

The adjournment of Congress on account of probable tariff discussion in the Senate now seems further off than ever. Chairman Allison, of the sub-Committee on Finance, having charge of the preparation of the Senate Tariff bill, says some days will yet be devoted to hearings given to different industries, and that there is no prospect of the bill going to the Senate this week. Senators claiming to be well posted on the subject say they will not be surprised if the bill does not come before the Senate for debate until the 1st of September, and are predicting that Congress will not adjourn until some time in October.

A gigantic lumber trust is said to have been formed in Minnesota and Wisconsin, embracing the principal lumber interests of those States, with headquarters at Eau Claire. The company are said to have \$80,000,000 invested in timber lands and to be backed by capitalists in Berlin. The scheme is to float logs over the falls at Minneapolis to large mills to be erected on the Lower Mississippi.

The Convent of the Sacred Heart, at Manhattanville, in this city, was destroyed by fire on Monday night. The loss is estimated at \$400,000. Painters had been engaged during the day gilding the new cross, and roofers had also been at work on the roof, and the fire was most probably kindled by a spark from a neglected charcoal stove. Insurance, \$169,780.

The Siemens Steel Works, at Landore, near Swansea, have been suddenly closed, and thousands of men have been thrown out of work.

The new wheat warehouse of the Northern Pacific Railway, on the seashore of Tacoma, fell into ruins, a number of piles in the foundations having been eaten away by the teredo, and at least 6000 tons of grain fell into the water.

MANUFACTURING

Iron and Steel.

McClure & Schuler, blast furnace engineers and contractors, at Pittsburgh, have closed a contract with the Williamson Iron Company, of Birmingham, Ala., for the erection of three of their Massicks & Crooke's fire-brick, hot-blast stoves of the three pan type, similar to those now in successful operation at the blast furnace of Schoenberger, Speer & Co., at Pittsburgh. They have also contracted with the North Chicago Rolling Mill Company for a plant of three 18 x 65 stoves of the same type, to be erected at one of the company's furnaces at Milwaukee, Wis.

The Nova Scotia Steel Company, with headquarters at New Glasgow, N. S., is about to change its name to the Nova Scotia Steel and Forge Company, Limited, and to increase the capital stock from \$300,000 to \$1,000,000, so as to enable the company to manufacture steel and iron in all its branches and articles consisting of iron or steel in whole or part.

Schoenberger & Co., the well-known iron manufacturers of Pittsburgh, signed the Amalgamated scale last week.

Joseph Corne & Sons, proprietors of the Massillon Rolling Mill, at Massillon, Ohio, signed the Amalgamated scale last week and their plant is now in full operation.

Dover Furnace, of the Penn Iron and Coal Company, at Canal Dover, Ohio, which has been idle for some time undergoing repairs, will resume operations during the present month.

The assignee of the Cartwright Iron Company, of Steubenville, Ohio, who made an assignment in June last, has filed his inventory, appraisal and schedule of liabilities. The assets are \$22,236.38 and the liabilities are \$58,232.39. The Miners' and Mechanics' Bank, of Steubenville, has a mortgage of \$9000 on the premises for purchase money, and there is due the employees \$3411.78. Among the principal creditors are:

Sherrard, Mooney & Co., Steubenville.	\$1,500.00
Allegheny National Bank, Pittsburgh.	2,500.00
Farmers' Deposit National Bank, Pittsburgh.	2,200.00
Spearman Iron Company, Sharpsville, Pa.	1,354.72
Girard Iron Company, Girard, Ohio.	6,859.54
Jefferson Coal and Iron Company, Steubenville.	3,738.94
Shoub & Michaels, Wellsville, Ohio.	4,631.64
Union Scrap Company, Pittsburgh.	6,228.04
J. B. Jones & Bro., Allegheny.	1,101.13
Robinson, Orr & Co., Pittsburgh.	200.94
Youngstown Mining Comp'y, Youngstown.	400.41

The stock on hand will sell for very little more than will pay the costs and the lien of employees, and it is not thought that the plant will bring more than enough to satisfy the mortgage.

The Hubbard Iron Company, of Youngstown, Ohio, whose plant is situated at Hubbard, signed the Amalgamated scale last week, and operations have been resumed. During the shut-down extensive repairs were made to the plant.

On Tuesday, the 7th inst., the Benwood Iron Works, of Wheeling, W. Va., gave orders to prepare the furnace in the forge department for immediate resumption. This department has been shut down since August 16, 1887, or about one year. It will resume operations in full in a few days.

A dispatch from Seattle, W. T., under date of the 11th inst., reads as follows: "A contract was let to-day by the Seattle, Lake Shore and Eastern Railroad to the Moss Bay Iron and Steel Company, of America, for 30,000 tons of steel rails, their delivery to commence next July.

The works of the Moss Bay Company are now in process of construction on Lake Washington, five miles from this city, and will be the largest west of the Mississippi."

The Keystone Rolling Mill Company, Limited, of Pittsburgh, signed the Amalgamated scale last week, and operations have been resumed in full. The company manufacture principally skelp iron, and give employment to about 300 men. This leaves but one firm in Pittsburgh that has not signed the scale, the firm being Dilworth, Porter & Co., Limited.

The Laclede Rolling Mills, of St. Louis, were closed down week before last indefinitely, so far as the lessees of the property, the Laclede Plate and Sheet Mill Company, are concerned. About 250 men are thrown out of employment by the shut-down. It is stated that there is a possibility that the plant will resume operations in the course of a few months. Two schemes are said to be on foot, by either of which the works could be operated under lease.

The report published in the Pittsburgh papers last week to the effect that the men of the Pittsburgh Tube Company, in that city, which have been idle for some months, were about to resume operations is without foundation. The works will remain idle until there is an improvement in the pipe market.

During the hot weather shut-down the Granite Iron Rolling Mills, of the St. Louis Stamping Company, St. Louis, are undergoing very thorough repairs. Three furnaces are being rebuilt, others overhauled, and the boilers and their foundations and gas connections are being looked after."

The Union Iron Mills, of Carnegie Brothers & Co., Limited, at Pittsburgh, have been closed down for a period of two months. The guide mill and bar mill will continue to run part of the time. The cause of the shut-down is to put in a new foundation of concrete and stone to take the place of the present one, which has crumbled away until it has become unsafe. A number of other repairs will be made.

Allderdice, Bishop & Co., of Warren, Ohio, who operated the Warren Rolling Mill a part of last year, have signed the Amalgamated scale. The plant is now under the control of Henry Wick, formerly of Youngstown, Ohio, who will operate it. The works contain 16 puddling furnaces, four heating furnaces and two trains of rolls. Operations will be resumed during the present week.

W. J. Hammond & Sons, Limited, proprietors of the Pennsylvania Iron and Steel Works, at Pittsburgh, signed the Amalgamated scale on Friday, the 10th inst. As their works have been idle for some months, the signing of the scale has been taken as an indication that operations will be resumed at an early day.

Thomas Furnace, of the Thomas Furnace Company, at Niles, Ohio, which has been idle for some time undergoing repairs, has again resumed blast. During the stoppage the furnace was relined and otherwise repaired.

The old crucible steel works at the side of the C. and P. track between Euclid and Woodland avenues, Cleveland, which had been leased for a term of years by Cleveland parties, repairs being nearly completed, was damaged by fire. The works contained a 9-inch train of rolls, two finishing heating furnaces, scrap furnace, hammer, and other facilities for the manufacture of merchant iron.

The employees of the Bellefonte Iron and Nail Company, of Bellefonte, Pa., are out on a strike on account of a reduction in wages proposed by the firm. Under date of the 6th inst. the firm write us as

follows in regard to the matter: "On July 1 we reduced our heaters 11 cents per ton, which reduction they declined to accept, and have been idle since that time. There was no reduction of our furnace wages or any question about the wages we were paying our firemen. On Monday, July 30, all our puddlers and helpers quit work, the cause of which we are unable to state, as there was no question of wages or any differences between us on the wage question. Our furnaces, rolling mill and factory will resume operations in a few days."

The Chicago Forge and Bolt Company have secured part of the contract for the Ashland avenue viaduct in Chicago. They have also successfully competed for heavy orders for bolts for the Ohio and Mississippi Railroad and for the new West Side Chicago cable road. It is understood that the residue of this cable contract was placed with Cincinnati manufacturers. The price agreed upon was \$38 a section, delivered in Chicago. This covers yokes, tubes, manhole-plates, &c., but not slot and tram rails. A section covers nearly a ton of material.

The Joliet Steel Company's new rod mill, at Joliet, Ill., built under the supervision of William Garrett, has recently been put in operation, and we are informed has started off better than any former mill of the kind. A material point of difference in operating this mill as compared with others in existence is that all the trains of rolls are driven from one massive engine, connected with large pulleys and very wide leather belts. The mill is roomy, airy, and fitted up to give the men every opportunity to make a large output without being overcrowded. It is too soon to say what the capacity of the mill will be, but it is understood that it will be no less than the best rate of production of any modern mill of the kind.

The North Chicago Rolling Mill Company have blown in two more blast furnaces at South Chicago, making three in operation and leaving one idle in that plant. These furnaces were started up to make Bessemer pig iron for another company and not because the demand for steel-rails had made a greater production of iron necessary to supply their own wants.

The announcement is made of the sale of the entire property of the Sheffield Land, Iron and Coal Company, Sheffield, Ala., for \$1,750,000 or \$2,000,000. The purchasers are mainly Eastern capitalists. Of the price paid \$750,000 or \$1,000,000 is to be in cash. The sale must be ratified by the stockholders. There is no likelihood of any hitch. In addition to the sum to be paid for the property the purchasers agree to invest about \$1,000,000 in new enterprises.

Col. S. F. Scott and C. P. Deatherage have purchased a two-thirds interest in the machinery of the Harrison Wire Works, St. Louis, and will move to Kansas City at once. The citizens of Kansas City have donated the grounds, valued at \$15,000, and have taken stock to the amount of \$25,000 for the purpose of building a large mill for manufacturing merchant iron, including wire of every description. Mr. James C. Anderson, of Chicago, who held a third interest in the old wire works, will retain his interest and manage the concern. A stock company was formed, with a capital of \$100,000, to operate the works. The purchase does not include any of the realty controlled by the Harrison Iron Works.

It is now practically settled that the St. Louis mill will resume on or about September 15. The work of rebuilding the burned portions of the Jupiter Furnace was to have commenced, but was deferred.

The Western Steel Company have surrendered possession. The work of stacking ore ready for commencement has begun, and train loads are being piled in and about the yards.

Machinery.

The contract for furnishing and placing 300 miles of wire for the police and fire-alarm telegraphs of New York City in the conduit put down by the Electric Subway Company has virtually been awarded to the Standard Underground Cable Company, of Pittsburgh.

Messrs. Stearns, Rogers & Co. have purchased the plant of the former Colorado Machinery Company, Pueblo, Col., and will commence work upon a big order for machinery for the Philadelphia Smelting Company as soon as the plant can be got in order. This fall the plant is to be enlarged and a new and extensive building erected.

The Scott Foundry Department of the Reading Iron Works, at Reading, Pa., have made the first shipment (five carloads) of the Pioneer Cotton Press, for the Pioneer Compress and Warehouse Company, at Brunswick, Ga. The shipment consisted of the whole boiler plant complete, with the links and cross-head of the cotton press, the latter casting alone weighing over 23½ tons.

John Mohr & Son, whose boiler works are located at 32 to 42 Illinois street, Chicago, have secured the contract for the boilers of the great Auditorium building in that city. There are to be 13 boilers in all, each 66 inches in diameter and 18 feet long. They will be built of Otis steel, furnished by Joseph T. Ryerson & Son.

John Duncan's foundry and machine shops in Fort Howard, Wisconsin, were burned on Sunday. Loss, \$40,000; insurance, \$10,000.

At a meeting of the board of directors of the Westinghouse Electric Company, of Pittsburgh, held in that city on the afternoon of the 11th inst., a dividend of 1½ per cent. out of the earnings of the last quarter was declared. The stock is selling at about one-half its par value, which makes the dividend equivalent to 12 per cent. per annum.

The Westinghouse Air Brake Company, of Pittsburgh, have awarded the contract for the foundation work of their proposed works at Wilmerding Station, on the Pennsylvania Railroad, near Walls Station, and the contractors will soon begin work. Among the structures to be built are the machine shop, which is to be 500 x 250 feet; the foundry, 500 x 300 feet; the boiler-house, 160 x 80 feet, and the blacksmith shop, 250 x 150 feet. It is estimated that the cost of the plant will reach nearly \$1,000,000.

On Saturday Manning, Maxwell & Moore, of New York, shipped from the Pond Machine Tool Works 117 tons of finished machine tools to various railroads throughout the country, from Massachusetts to Kansas, and as evidence that their shop is in full operation they would state that they made the castings in the foundry, finished in the machine shop, and shipped last month the following tools: One 42, one 36, one 38 and one 30-inch special heavy lathe; one 40-inch planer, with two heads on the cross-rail and two on the uprights, 60-foot bed for the Chicago, Rock Island and Pacific shops, at Horton, Kan.; one 36, one 32 and one 22-inch planer; an 84-inch boring mill, with two heads on the cross-rail; a 72-inch boring mill, a 60-inch radial drill, a 32-inch upright drill and several punches and shears and chucks. They made also one of the large steel-tire turning lathes, for turning steel-tired wheels on their axes,

weighing some 47,000 pounds, which they shipped to the Horton shops of the Chicago, Rock Island and Pacific. They are now working their 400 men, and are prepared to fill orders for all kinds of their standard tools promptly, as they have complete parts for nearly the entire list of their tools.

Hardware.

The property of the United States Stamping Company, of Portland, Conn., was sold at public auction to satisfy court judgments and mortgages. Myer Hellman, of New York, bid off the real estate for \$11,500 and the machinery and personal property for \$16,100—making a total of \$27,600. The price is considered cheap for the property. It is thought that Hellman bid off the property for a new company.

Miscellaneous.

Licenses of incorporation have recently been issued by the Secretary of State of Illinois, as follows: The Conley Iron and Steel Company, Chicago; capital, \$1,750,000; incorporators, Arnold Brecher, Laing Leland, J. Howland Silveira and Sumner Stowe. The Chicago Cold Bending and Coiling Pipe Company, Chicago; capital, \$150,000; incorporators, George W. M. Reed, George H. Bozet and Earl B. Smith. A certificate was filed recording the increase of the capital stock of the Garden City Steel Company at Chicago to \$10,000.

The street pavement of steel bars mentioned in these columns some months since as having been laid in Chicago has proved unsatisfactory, and the company by whom it was put down have been ordered by the city to replace it with granite blocks.

From the Marquette, Mich., *Mining Journal*, of the 11th inst., we take the following: For the week ending with Wednesday, the 8th, the lake shipments of iron ore from the mines of the Lake Superior region amounted to 165,533 gross tons, of which 21,795 tons went from Marquette, 45,575 tons from St. Ignace, 73,839 tons from Escanaba, 21,795 tons from Ashland, Wis., and 13,845 tons from Two Harbors, Minn. This makes the aggregate for the season to date 2,031,897 tons, this being 251,478 tons less than the quantity that had been sent to market by lake at the corresponding date last year. The shipments by range are as follows: Marquette range, 788,066 tons; Gogebic range, 592,350 tons; Menominee range, 495,986 tons; Vermillion range, 155,495 tons.

Port.	1888.	1887.	1886.
Marquette.....	305,042	438,782	485,495
Escanaba.....	1,024,142	1,083,363	790,903
St. Ignace.....	63,457	47,682	36,907
Ashland, Wis....	483,761	541,500	335,553
Two Harbors, Minn.....	155,495	171,775	156,346
Total.....	2,031,897	2,283,370	1,804,203

The Ohio Falls Car Company, Jeffersonville, Ind., have taken an order for 200 gondola coal cars from the Louisville and Nashville Railroad, which, besides the other freight work, will keep them busy until October. For several months they have been busy on passenger work, avoiding the low prices bidding on freight contracts. The restarting of the freight department will give regular employment to several hundred hands, who were laid off or occupied in other ways. The company have made extensive improvements during the interim, some being a complete saw-mill added to the plant and the building of large shops for the erection of freight cars.

The Aluminum Brass and Bronze Company, of Waterbury, have purchased a tract of land in Bridgeport, Conn., and will begin at once to erect brick buildings covering 65,000 square feet of ground for their works. The company will have a capital stock of \$250,000 paid in, and will soon establish a large plant.

The Iron Age

New York, Thursday, August 16, 1888.

A complete Index for Volume XLI, January to June, 1888, is now ready. Subscribers desiring to have a copy should apply early, as only a limited number have been printed.

Tributary Traffic.

A question of importance in transportation has lately been brought to public attention. In brief, it is this: Has a trade center a legitimate claim upon the traffic which may be tributary to it, and if so, in what does it consist and how far may it demand favoring rates of freight? Not long since the merchants of Kansas City appealed to the railroads running through Kansas and through the East to arrange rates on Kansas corn and other products so that they might buy it, bring it to Kansas City, and resell at Chicago or at the seaboard. As the tariffs then stood this was doubtful, because the through rate to Eastern points from place of growth was lower than the local rate to Kansas City and the through rate from thence. A recent meeting of railroad managers was held to consider the appeal, but without result thus far. If the railroads raise the through rate it must necessarily hurt the grower, and in the long run the carrier too; and yet the Kansas local rates cannot be reduced without cutting down such railroad revenue as may be considered necessary for reasonable profit, and which on local business is not unfair.

The same discrimination is complained of by Chicago. Instances are cited where grain from Iowa and Nebraska has been carried to New York at through rates which are less than the sum of the rates to Chicago and then to New York. The Interstate Commission has lately been taking testimony upon a somewhat similar complaint at Detroit. The tariff between Detroit and New York is 78 per cent. of the Chicago-New York rate, while the proportion of the roads East of Detroit on Chicago traffic to and from New York is but 70 per cent. of that through rate. The defense of the railroads is that these facts have no real relation to each other; that the Detroit-New York rate is reasonable in itself and cannot be judged by any proportion of a through rate to any other city; that strict mileage proportion in making tariffs is out of the question, because, as all acknowledge, terminal expenses are not reduced as distance is shortened, and hence the shorter the haul the greater the proportional cost. It must be acknowledged, however, that this state of things has one bad result; it destroys the possibility of the gathering in of a large traffic which shall be tributary to that city from a wide extent of country, for the

through rates to and from villages, with higher local rates for local trade, will tend to free those villages from dependence upon any near-by city.

The Interstate Commission are already on record upon this point. When Omaha complained that the rates from Chicago to Lincoln were lower than the two rates each side of Omaha added together the Commission declined to condemn the tariff. Omaha, they said, could not ask to control Nebraska business to the detriment of the rest of the State. The reasoning would seem to be sound. Why should any city, whether on the seaboard, on the lakes, or on the rivers, continue to monopolize the trade of large sections of our country through unduly favoring freight rates, to the disadvantage of a large portion of our people? It is of great importance to a healthy growth in prosperity of any State that its products of the soil or of manufacture should reach consumers at the least possible expense of time or money, and that return commodities should in like manner be transported to them from points of origin. If we admit that particular trade belongs of right to particular places we endanger this other right to general prosperity. It is a fact, too, that cities generally do not need special transportation favors to secure and retain a fair trade. The advantages of neighborhood are of themselves decidedly great. Quick delivery of goods sold and quick returns for produce consigned, a more intimate friendship between buyer and seller than is possible when these are widely separated, these and other points will be readily appreciated, and small disadvantages in freight rates are not enough to overcome them.

It is possible that we may shortly see modifications in our geographical arrangement of rates. Heretofore a prominent place like Chicago has been the basal point of the system, and the rates to and from other places have been made in proportion. But such a system, while orderly and readily understood, has its disadvantages. New York, Chicago, Kansas City, Detroit are basal points, because they are natural trade centers. It may be argued, therefore, that they really do not need rate favors. Another reason for their position as basal points is that there is a necessity for some stopping points in tariffs. But such a system does not always admit of the lowest possible rate—say, on grain—from the wheat fields to the consumer, who possibly may be located in Europe; for under this supposed railroad necessity for a basal point this grain may be compelled to pay tribute to some railroad competing point not on the direct line to destination. If we acknowledge any authority in European precedents, such a round-about journey, if it exceed the straight line by more than 25 per cent. of distance, is a wrong to the direct line and to the shipper, if his possible gains be lessened by this really needless adherence to a geographical system. It is probable that from these complaints of discrimination on the part of the cities we have named will arise decisions by the Interstate Commerce Commission, by our railroad managers and by public opinion, leading to the opinion that no particular section or cities have any inherent right to any particular trade, and that the first principle is the cheapest possible carriage between producer and consumer, without regard to geographical position of other intermediate towns.

The Blast Furnaces on August 1.

During July quite a number of furnaces blew in, the majority of them classing among the larger producers, so that on the whole the tendency is again toward a slightly increased product. The reports from a number of plants now idle, which contemplate an early resumption, lead to the conclusion that this tendency has not yet spent its force, though it must not be forgotten that it is natural to report the prospect of early blowing in, while few furnace managers, often hoping against hope to carry their stacks through serious trouble, are willing to admit that they may soon be forced to go on the list of temporarily idle plants.

In detail, the position of the anthracite furnaces was as follows:

Anthracite Furnaces in Blast August 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.

Maryland.....	4	0	0	4	482
Total.....	187	93	33,397	94	21,571

As will be observed from the following comparison, August opened with a slightly increased capacity at works, though of course considerably below that of last year:

	Furnaces in blast.	Capacity per week.
August 1, 1888.....	93	33,397
July 1.....	92	32,478
June 1.....	96	32,418
May 1.....	94	31,006
April 1.....	94	30,486
March 1.....	96	28,586
February 1.....	97	29,959
January 1.....	118	38,206
December 1, 1887.....	122	39,487

September 1.....	125	38,338
August 1.....	129	37,930
July 1.....	138	40,742

In New York the principal events during July were the blowing in of the Kirkland furnace, on the 17th, and the stoppage of the second Onondaga on the 14th. In New Jersey only four furnaces were in operation, Chester remaining banked. The second of the spiegeleisen furnaces of the New Jersey Zinc and Iron Company was, however, blown in on the 2d of this month. In the Schuylkill Valley Mount Laurel is now idle, and Norway was forced to go out for relining on the 26th ult., with the possibility of resuming in the beginning of October. Topton, too, was not running at the beginning of the month. In the Lehigh Valley Crane is running all its five furnaces. Bethlehem is producing with six, the Thomas Company with ten, and Glendon one. Durham, which was out of blast since January 21, ran during the greater part of July. Returns of the production of every furnace, with the exception of a single one, make the aggregate July product 44,052 gross tons. The growing use of Lake ore at the leading works is running up the product.

In the Lower Susquehanna Valley, the only change brought about is the blowing in of the second Chickies furnace. The Lebanon Valley continues its exceptional

position of being that producing section in which by far the greatest percentage of the capacity is actively engaged. Returns from all but one furnace company show a total production of 30,000 gross tons in July. In the Upper Susquehanna district the same plants are running, their aggregate July product from official reports being 11,529 gross tons.

The position of the coke furnaces was as follows on the 1st inst.:

Bituminous and Coke Furnaces in Blast August 1

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.

The coke furnaces have therefore recovered to their May and June work, as the following comparison will show:

	No. of furnaces.	Capacity per week.
August 1, 1888.....	122	74,865
July 1.....	121	69,543
June 1.....	128	75,427
May 1.....	130	75,815
April 1.....	128	70,644
March 1.....	128	68,892
February 1.....	136	73,912
January 1, 1888.....	143	83,101
December 1, 1887.....	144	88,835
November 1.....	151	90,459
October 1.....	152	89,123
September 1.....	145	83,124
August 1.....	113	62,001

In the Pittsburgh district Isabella No. 1, which has been idle for several months for repairs, blew in early this month; Edith, which went out on April 5, is to be ready on about September 15, and Soho, of the Moorhead-McCleane Company, may be at work toward the close of next month. On the other hand, Lucy No. 1, of Carnegie Brothers & Co., Limited, is expected to go out for repairs during the current month. On the whole, therefore, an increasing product is expected. In the Shenango Valley Ella is out for repairs, but on the other hand Etna started again on the 26th ult. Neshannock did not come up to its usual product in July, being stopped for two weeks to put in a new 18 x 60 Whitwell hot-blast stove, making the fourth of that plant. One of the Stewart furnaces was blown out in July. In the Juniata and Conemaugh valleys 12 furnaces made last month 26,674 tons of pig iron, an unusually large output. Among the furnaces grouped under "Miscellaneous" in Pennsylvania, it may be noted that Center was to begin blowing again early this month.

In Maryland Catocin, under new management, resumed late in July. In Virginia there have been no changes.

During the month Lynchburg is again to be added to the active stacks. In West Virginia Belmont was still the only plant producing on the 1st inst., but since then Irondale has resumed. In Kentucky all the four furnaces are running, Ashland making American Scotch foundry iron.

In the Mahoning Valley production is again on the increase. During July Anna resumed on the 20th ult., Mary on the 26th and Thomas on the 1st inst. Falcon was still banked early in the month. The July product was 23,429 tons, but the furnaces are now producing at the rate of 7516 tons a week, or close to 32,000 tons a month. An increase has also taken place among the furnaces in Central and Northern Ohio. The Cleveland Rolling Mill Company are running three furnaces, Zanesville is again producing, and Benwood was to blow in early this month, and one of the Graffton furnaces, leased by McKeefrey & Hofins, is having a new bosh put in, which was completed yesterday. Emma went out for repairs on the 27th ult., while Franklin was banked during the whole of July. In the Hocking Valley the only item of news is that Crafts is to resume this month. In Illinois Calumet stopped for repairs, which, it is expected, will be completed by October 1, but, on the other hand, the South Chicago plant is doing more, so that the capacity blowing is greater, though the number of furnaces was the same. In Missouri only one stack is at work. In Wisconsin the second Bay View is now idle, too, but, on the other hand, Minerva and Mayville are at work.

In Alabama Sheffield was banked on the 24th ult., but one of the Sloss furnaces went in on the 11th. The first stack of the Sheffield and Birmingham Company is to be blown on the 17th. Both Alice, two Ensley, two Eurekas and one Woodward are at work. In Tennessee Sewanee is out, and one South Pittsburg furnace is idle. In Georgia Cherokee went out of blast for want of coke and to make repairs. The position of the charcoal furnaces was as follows:

Charcoal Furnaces in Blast August 1.

Location of furnaces.	Total number of furnaces.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New England.....	14	7	510	7	580

Total.....	176	65	11,137	111	10,065

There have been few changes in the status of the charcoal furnaces. In Maryland Muirkirk was stopped by a fire. In Virginia the same furnaces are at work, to which Walton is soon to be added. In Kentucky both Bellefonte and Hunnewell are producing and Estill is to come in at an early date. In Ohio Vesuvius has

stopped to put in a new hearth and bosh, while in Michigan Spring Lake is preparing to go in, if indeed it has not resumed at this time. In Wisconsin Hinkle is expected to blow in September 15th. In Tennessee Bear Spring went into blast on the 24th ult., and Speedwell was expected to blow again on the 15th of this month. In Alabama both the Woodstocks are out, No. 2 having stopped on the 1st inst. for repairs.

The Position of Tin Plates.

The reduced stocks of tin plates on this side, approaching downright exhaustion in some grades, in spite of the largely increased importation, lead to the conclusion that our consumption of the article is greater at present than it has been at any previous time, and that with our fine fruit and cereal crops and the comparative cheapness of provisions and petroleum the tin plate trade will continue to flourish during the coming fall season. This expectation is heightened by the promise of an unusually heavy export of merchandise in general, and of canned goods in particular, to the Antilles, South and Central America. Since the rise in coffee and sugar planters are again flourishing, the result being an enlarged consumption of all sorts of canned goods.

Our import of tin plates for the 11 months of the fiscal year, which ended June 30 last, was 12 per cent. greater than during the corresponding period of 1887, for it amounted net to 255,628 tons of 2240 pounds, against 228,270 tons during the preceding 11 months, yet the stocks in the seaports and the interior have reached a low ebb, proving that the absorption has run ahead of the unprecedented supply.

We have before us the circular of Messrs. Henry Nash & Co., Liverpool, from which we extract a few figures relating to the export thence of tin plates to American ports during the first six months of 1888 and 1887. They were as follows, in boxes:

English Exports of Tin Plates to American Ports.

Port.	1887.	1888.
New York.....	501,414	222,366
Philadelphia.....	161,297	222,327
Boston.....	109,041	114,022
Baltimore.....	115,124	127,973
San Francisco.....	79,307	68,078
New Orleans.....	28,272	40,174
Portland, Me.....	53,156	19,409
Portland, Ore.....	8,524	4,213
Other ports.....	47,657	18,398
Totals.....	1,101,792	964,967

The falling off to New York will be noticed.

The Board of Trade returns for tin plates for the first six months were as under:

	1886.	1887.	1888.
	Tons.	Tons.	Tons.
To France.....	2,343	8,106	2,449
the United States.....	143,383	126,310	140,424
Canada.....	5,643	8,472	8,996
Australia.....	1,879	3,081	4,384
Other countries.....	23,741	26,219	31,976
Totals.....	151,994	176,188	188,179

The increased takings by Canada and Australia will be observed.

The most surprising thing is to find out how very well sold most of the makers are. Some few of them make it a rule never to sell forward to any large extent, but the great majority of them say they cannot deliver plates before September, some say October, and even all the year has been named by others. The volume of exports keeps up; the total shipments

to all ports are about 240,000 boxes in excess of last year. The stocks in shipping ports have been decreased during the month 15,000 boxes.

Considering the numerous fluctuations in pig tin since October last, makers have steered their way well enough, and the comparative steadiness in the price of plates at Liverpool has evidently been instrumental in giving an impulse to exports; if prices had fluctuated largely through speculative influences or a wavering disposition on the part of makers, exports would not unlikely have diminished, instead of following its even course undisturbed. It is to be hoped that a similar conservative spirit may characterize the remainder of the year and steady the confidence in the future of the article.

The economic handling of material in carrying out engineering work of any magnitude is deservedly a matter of much interest, and the novel expedients which now and then suggest themselves under special conditions are well worth recording. We have been tempted to refer to this subject more particularly by the recent publication of an account of some of the methods adopted in sinking the caissons for the Forth Bridge. A specially designed hydraulic shovel was used in digging through a stratum of very tough boulder clay, and some means had to be provided for getting rid of the water which the apparatus exhausted, and which accumulated in the caisson. To avoid distressing the men the air pressure in the caisson, after the latter was made tight against the entrance of water around it by sinking the edges into the clay, was allowed to fall to a point much below the hydrostatic pressure due to the head of water above it. It became doubtful whether with an atmosphere relatively so attenuated the pumps employed would lift the waste water through the 60 or more feet necessary to reach the surface, and the question was therefore solved by the simple expedient of setting the suction-pipe so as to draw in air with the water. In passing through the valves together, the air and water were churned into a sort of emulsion, lighter than water alone, and a discharge of this was easily maintained from the upper end of the delivery-pipe, without resorting to force-pumps or air-chambers. While we are not aware of any previous instance where the lift amounted to as much as 60 or 80 feet, the notion of taking advantage of the reduced weight of a mixture of water and air, as compared with that of water, is not so very new, but has, we think, been applied on many occasions in raising water through heights ranging from about 28 to 86 feet. The account, however, recalls the method which, we believe, was adopted a number of years ago in the Hudson River Tunnel in removing from the heading the material of excavation. This, which was soft mud, was thinned by the admixture of water, and in this state was forced by the air pressure in the heading through a line of pipes leading from a trough to a suitable place for deposit on the surface. The length of the pipe line, as we remember it, was considerable, without, however, giving rise to any difficulty, and the simplicity and convenience of the method were striking. No machinery

was necessary, as pipes simply were laid down and a slight additional tax was put on the air compressors, which were in regular use for supplying the headings. But the novelty of this arrangement also may be questioned, since in some localities in the manufacture of earthenware the clay, in a properly prepared state, is conveyed through pipes over short distances in a similar manner, illustrating the advantages of the system, though somewhat modified, on a relatively smaller scale. The peculiar value of the methods under certain conditions, however, makes them generally interesting.

The steel rail situation in the West is becoming a matter of anxiety to others besides the steel rail manufacturers. As long as orders for steel rails were abundant the manufacturers of other forms of iron and steel competed with one another on fairly equal terms for business, and often enjoyed an overflow from the rail mills of work which the capacity of some part of their plant was not equal to. The rail mills were then very far from being a disturbing element in the general situation, except that they formed an important factor in making the price of ore and coke high by consuming such enormous quantities of these materials, and thus indirectly but unintentionally making such materials high-priced for other iron and steel manufacturers. Now, however, the situation is changed, and the makers of iron and steel for the general market have good reason to feel apprehensive of competition for business in many lines from the great Bessemer steel works. They have blast furnaces of the most modern type, employ accomplished chemists, have able managers, and are prepared to make pig iron of nearly any quality desired. A number of them have rolling mills for turning out other products than rails, and can speedily enter the field with mild bar steel to take the place of iron or to supplant the higher priced bar steel made by mills purchasing the blooms or billets. The Joliet Steel Company have already embarked in the manufacture of wire rods to secure an outlet for part of their product, and the North Chicago Rolling Mill Company are contemplating the erection of works to enable them to produce a heavy output of other forms of steel than rails, but there will still be a surplus capacity in the Western steel works for the production of steel for the general market if the demand for rails does not improve. The entire substitution of steel for iron has often been prophesied, and the fulfillment of the prophecy has been as often deferred, but every such period of dullness in the rail trade as that now existing brings the inevitable day nearer when steel will crowd rolled iron to the wall.

During the past few weeks our market reports from every section of the country have reflected the healthier tone which has at last given way to the long continued decline. Buyers after having long kept within the bounds of early requirements have at last purchased liberally for delivery into the future. Month after month the patience of sellers was sorely tried by the absence of round orders. Again and again the claim that bottom had been reached was disproved by the announce-

ment of lower prices. Sellers from distant points, unheard of in local markets, pressed material with all the vigor, and all the indifference to price, which characterizes those who are seeking a footing in new territory. The tide has at last turned. It is rising slowly, almost imperceptibly. No one expects a sudden increase in values, and the position of business generally throughout the country is still too dependent upon crop developments to admit of the statement that a set-back is impossible. A discouraging feature, too, which of course has its indirect effect upon all departments of the iron trade, is the steady decline in steel rails, which have sold at \$29 at tidewater and at \$30 at Chicago. But in all the other lines which go to making up the greater part of the business in which the readers of *The Iron Age* are interested it has been clearly shown that restricted buying has made the current consumption appear really smaller than it was. When there is an end to the present uncertainty as to the crops, with its exaggerated misstatements made on both sides by interested speculators, then it will become clear what the tendency is to be. A great gain has already been made in putting the markets into a sounder and more hopeful position.

The lightning rod has endured more ridicule than usually falls to the lot of a novel appliance whose value cannot be incontestably proved. This is partly owing to the poor quality of the earlier rods, and partly to the peculiar methods of the lightning-rod men themselves, who in the past have sold their goods in the country districts by the assistance of the most extravagant stories. Unwarranted and ridiculous claims have had much to do with the disrepute into which the lightning-rod has fallen among the uneducated. Intelligent people, however, who have not been misled by ignorant report, are almost unanimous in considering it an important factor of safety. So general is this reasonable faith that it is astonishing to read in a journal devoted exclusively to electrical matters, that "the uselessness of the lightning-rod is becoming so generally understood that the agents find their vocation a trying one. Fewer and fewer rods are manufactured each year, and the day will come when a lightning-rod on a house will be regarded in the same light as a horseshoe over a man's door." We are not in possession of statistics of the lightning-rod industry, so cannot admit or dispute the statement that the manufacture of lightning-rods is decreasing. Estimated in lineal feet, we would not be surprised if the production had fallen off, but this is no fair criterion. Some years ago large quantities of small iron lightning-rods were sold, and were fitted and put up in the cheapest possible manner. Such conductors, when new, were of little, if any, use, and after a short time, when the points became rusty and the joints broken, were utterly and altogether valueless. It is not fair, therefore, to condemn the system because so faultily exemplified. It is quite likely that the wretched imitations of lightning-rods are made less than heretofore, but, on the other hand, rods well constructed and fitted are increasingly popular. A well-made copper rod with gilded points and ample groundings cannot be had for a six-

pence, and the owners of houses of moderate cost would rather brave the uncertain thunderbolt than meet a certain expense. The fact that cheap and inefficient rods are less popular than formerly is no argument that the principle of protection by lightning conductors is scientifically unsound.

CORRESPONDENCE.

The Life of Iron Roofs.

MARSHALLTON, DEL., AUGUST 14, 1888.

To the Editor: Noticing in *The Iron Age* of the 9th inst. an article "The Life of an Iron Roof," I would state that my barn is covered with an iron roof which was put on in 1846. This roof is the ordinary standing groove, and, beyond painting every three or four years and some slight repairs caused by the blizzard last March, has cost nothing since it was put on. We have a house in Wilmington that has a similar roof, put on in 1850, and, except an occasional painting, has cost nothing for repairs. An adjoining tin roof of about same size, put on at same time as the iron roof, has required as much painting as the iron roof, and cost over \$100 additional on repairs. Both the iron roofs above mentioned are in perfect condition to-day. Very respectfully

J. R. BRINGHURST.

The autumn meeting of the Iron and Steel Institute is to be held at Edinburgh on the 20th, 21st, 22d and 23d of August. The following papers will be presented: "On Testing Machines," Daniel Adamson, president; "On Manganese Steel," R. A. Hadfield, Sheffield; "On the Metallurgical Exhibits at the Glasgow Exhibition," W. J. Millar, C. E., Glasgow; "On the Mineral Resources of Eastern Scotland," H. H. Howell, director of the Geological Survey of Scotland, Edinburgh; "On the Forth Bridge," F. E. Cooper, M. I. C. E., resident engineer; "On the Testing of Materials of Construction in the United States," George H. Clapp, Pittsburgh; "On the Chemical Processes Involved in the Rusting of Iron," Professor Crum-Brown, F.R.S.S.L. and E., Edinburgh; and "On a New Form of Pyrometer," Professor Wiborgh, Stockholm.

Sulzer & Vogt, proprietors of the Louisville Machine and Elevator Works, Louisville, Ky., finding that their shops are inadequate for present requirements, have purchased a large lot on the corner of Main and Preston streets, running through to Washington street, and are now erecting a building for machinery shops 50 x 200 feet, four stories high. The foundry will be 45 x 200 feet, the blacksmith shop 30 x 60 feet, and the warerooms 40 x 200 feet. Across Washington street they are building boiler yards and sheet-iron works 105 x 200 feet. The two specialties manufactured by Sulzer & Vogt are ice machines and elevators, both of which are widely used through several States. The firm have been working under disadvantages for some time, as the old buildings now used are some distance apart, requiring extra supervision in the various works. It is a bold venture on the part of this enterprising firm, who are uniting the several lines of business on so large a scale, and it will be watched with interest, but as the present move is the result of success in the past it will not be surprising to see them continue to prosper.

During the first six months of the current year the Boston and Montana Copper Company produced at their Butte works 14,866,750 pounds of matte, containing 8,815,484 pounds of fine copper. The product of June was 1,775,000 pounds fine.

OBITUARY.

John Featherstone.

Intelligence has been received from Dresden, Germany, of the sudden death at that place of John Featherstone, of Chicago, proprietor of one of the largest iron foundries in the Northwest. Mr. Featherstone had been in poor health for a year or more, and about a month since left Chicago for the East and for Europe, arriving at Dresden but a short time before his death, which occurred on the 9th inst. He was born in Schenectady, N. Y., in 1834, and was therefore but 54 years old when he died. He was of English parentage, his father having removed to America from Exeter, England, a few years before his birth. The untimely death of his father threw the support of the family upon John, who was the oldest son, and who had just learned the trade of a molder. He was equal to the situation, and demonstrated, while yet but a boy, the possession of those qualities which made him such a successful business man later in life. He removed to Chicago in 1866, and entered the service of the Chicago and Northwestern Railroad Company, remaining until he attained the foremanship of their brass foundry. Soon after, about 1870, he concluded to engage in business upon his own account, and started a small foundry at North Halstead and Front streets on the site now occupied by the large works into which his modest venture steadily grew. He has been in late years ably assisted by his sons, who will doubtless continue the business which their father established upon such a solid foundation. Mr. Featherstone possessed in an eminent degree the esteem of those brought into business relations with him. They recognized him as a man endowed by nature with more than ordinary shrewdness, and who had added to his natural gifts those qualities and advantages only secured by constant application and intense devotion to a chosen occupation. He was an accomplished mechanic, whose delight was to solve an intricate problem over which his co-workers were puzzling, and whose thoroughness of knowledge in everything pertaining to his craft assured perfect work. Although he watched every detail of business with scrupulous care, as does every successful man, he was of a generous disposition, and his charities were many. To his employees he was a strict master, but a most faithful friend, and always possessed their entire confidence. He married early in life, and leaves four sons. His remains will be removed from Dresden to Chicago for interment.

Parties formerly interested in the copper mines at Blue Hill, Me., upon which much work was done several years ago, and which were closed on account of the very low price to which copper fell, have lately taken the properties upon which the most important development work was done, and a new company have been organized, capital \$250,000, under the laws of Maine, to work the combined property, and operations have already begun. It is expected to very soon get out some paying copper.

The Leechburg Foundry and Machine Company, of Pittsburgh, whose works at Leechburg were partially destroyed by fire on March 29th last, the foundry buildings and machine shop being razed to the ground, have replaced these buildings. The new foundry building is 125 feet long by 60 feet span, in which steel ingot molds will be made. The new machine shop is 60 feet wide by 105 feet long. The works will be connected with the Pennsylvania Railroad by a switch, which will

give the company excellent shipping facilities, and are also equipped with the most modern machinery and appliances, and are now in full operation with orders enough on hand to run them full time the balance of the year.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., AUGUST 14, 1888.

Senator Allison said to-day that he thought it would be safe to say that the Revenue Reduction bill upon which the Sub-Committee on Finance have been engaged for so many weeks would be ready by this time next week. The sub-committee have gone over the entire sweep of the sources of revenue from customs and excise, and think that they have been able to compile a bill which will have a minimum effect, if any at all, in disturbing industries. These changes have been made in the customs duties. They have been incorporated in the bill with the co-operation and consent of the parties directly concerned, or at least by a representative share of them. There have been various speculations as to the prospects of the Senate bill after it reaches that body. The Democratic Senators some time ago announced their intention to antagonize it with the Mills bill line for line. This was then intended simply for campaign capital from their point of view. They are still of the same purpose, but from a very different point of antagonism. They have suddenly discovered that there is a very strong probability that if the Senate substitute as they understand it gets into the House it will stand a very good chance of passing. The tobacco tax provisions are favorably considered by the Democratic representatives of the tobacco districts of the South. These gentlemen say that as their own bill failed to give their constituents the relief which they demand, they will avail themselves of any other favorable opportunity to secure the passage of a bill for revenue reductions containing such provisions. The Administration Senators have just begun to realize that they have a more serious contest on their hands in their body than the utterance of mere campaign buncombe. It is now their purpose to make a struggle to prevent a vote being taken in the Senate before the election in November.

The Senate bill will be well under way by September 1. It is not the wish of the managers to get at a vote before the beginning of October. They then propose to bring the fighting to close quarters, first, by taking a vote in the Senate. Then the Republicans of the House will force the issue there. It would be a disastrous piece of business for the managers of the Mills bill to find the House concurring in the Senate substitute, and yet that is not an improbability, judging from the undercurrent of sentiment among a number of those who were at heart opposed to the Mills bill, but voted for it as a matter of party fealty. There has been method in the management of the revenue reduction measure in the Senate. If it should turn out as now not at all improbable it will stamp Senator Allison as one of the most adroit political managers in the Senate. It was largely due to his courage and determination that the Republicans of the Senate were kept up to the line of an aggressive fight. A number were willing to sneak out of the contest under cover of postponement until December. It was Senator Allison's speech, backed by a few other remarks at the conference at Mr. Evarts' residence, which brought the skulkers back into line.

The movement has now gone so far that there is no chance to retreat with credit.

Nor is there any disposition to make a retrograde movement, as every Republican Senator is now convinced that the right thing has been done and the Sub-Committee bill will receive their united and vigorous support in debate and in the vote.

The Loeb Respirator.

London *Engineering* gives an account of an exhibition recently held in London of Loeb's appliances, which are designed to enable the wearer to breathe and work with comfort in dense smoke, and also in poisonous gases. The appliance consists of a respirator with an india-rubber mouth-piece. The respirator is held by two projections, which are grasped between the teeth and the lips, additional security being provided by an elastic band passing round the head. The air is drawn in by the wearer through a series of small filters, containing respectively wet sponge, cotton wool, cotton wool damped with glycerine, and animal charcoal. These filters are very lightly packed, so that there is no resistance to the act of inspiration, and they are provided with valves which direct the air expired from the lungs into the external atmosphere. The entire apparatus weighs less than a pound, and can be used without previous practice. When it is to be employed in an atmosphere which is deadly in its character, as in the choke damp of mines, the air is drawn from some place where it is pure through a light india-rubber tube. The filter is then strapped to the waist of the wearer, and the respirator merely contains the valve, which cause the air to be drawn through the pipe and then to expire into the atmosphere. A tube up to 100 feet in length can be manufactured with facility. Protection is afforded to the eyes by a pair of spectacles with india-rubber rims, which press tightly on the cheek and brow and exclude all smoke. Mechanical wipers are added to enable the glasses to be cleaned without removal.

A man wearing the respirator spent half an hour in a building filled with dense smoke of a most pungent character without any difficulty, and afterward the inventor's representative, with the aid of a flexible air pipe, entered a room containing a dish of burning sulphur and remained there some time. It was clearly demonstrated that the respirator would enable the wearer to enter a building filled with smoke and discover the exact position of a fire. A few buckets of water promptly applied under such circumstances will do more good than the jet from a steam fire engine directed at random. On board ship, where the result of a fire is to fill the hold with smoke, this respirator would be most useful, and this fact has been recognized in the German navy, where Loeb's respirators form part of the official equipment. Many of the German fire brigades have also adopted them. They are being introduced into England by the Fire and Mining Appliances Syndicate, of 49 Queen Victoria street, E. C., London.

The Hastings Dormitory for Cambridge, now in process of erection, will be composed largely of iron beams and terracotta building blocks and the seven stairways all of iron, with a balustrade of wrought-iron strapwork. The exterior dimensions are 210 x 120 feet, and the walls are of brown mottled brick from Perth Amboy, N. J. The cost of the edifice is estimated at \$230,000.

Railway trains are now running direct from Paris to Constantinople. The next move is a railway from Constantinople to Bagdad, to cost \$75,000,000; distance, 1400 miles.

Lima Oil in Chicago.

Crude oil from Lima, Ohio, commenced pouring into the great tanks at South Chicago on Monday morning, after three weeks from the time of starting, through an 8-inch pipe 206 miles long. The oil is now flowing at the rate of 8000 barrels a day, and is designed for use as fuel. The plant at 100th street will be the distributing station for the Northwest. The company have secured 43 acres fronting the lake, where they will build side tracks. Pipe lines will probably be laid to the plant of the Union street company, the North Chicago Rolling Mills Company and the leading brick manufacturers. To smaller consumers the fuel will be delivered in tank cars. The National Transit Company, who handle the oil for the Standard Company, assert that 100 manufacturing firms are now using the new fuel in Chicago with great profit. They also say that the leading mills of Minneapolis and nearly all the great factories of the Northwest are under contract to use the oil. When necessary, the supply of oil by the pipe line can be increased to 24,000 barrels per day. This is accomplished by relay tanks, which are built along the route of the pipe, and which are kept filled. It will take about nine days to fill the two tanks now completed. In the meantime side tracks will be laid up to their sides and shipping will begin at once. Up to the present time the cost of oil to consumers has been 1.4½ cents per gallon. It is expected that the price will now be slightly reduced. Oil men antagonistic to the Standard Oil Company admit that there is at present some saving to manufacturers by using the liquid fuel. But they also say that when the majority of manufacturers get their burners in the price of petroleum will advance rapidly until they will be obliged to pay as much, if not more, for their fuel than before. They say that the burners are very expensive, and few firms will revolt against an increase in the price of oil unless it becomes too great a burden. The Standard people say the burners are not costly and are easy to remove. They are making iron-clad contracts with their patrons to furnish the petroleum at a fixed price.

Manitoba's Large Wheat Crop.

The wheat crop of 1887 in Manitoba, according to figures collected by the Winnipeg Board of Trade, was even more phenomenally large than was at first reported. The estimate of 12,000,000 bushels at first published was rightly regarded as an extraordinary one. To it is now added, however, another 2,000,000 bushels, bringing the total up to 14,000,000 bushels. The accounting is thus made:

	Bushels.
Wheat exported to Eastern Canada and Europe.....	8,500,000
Converted into flour in Manitoba....	2,600,000
Used as seed, 520,000 acres.....	1,100,000
In hands of millers and shippers and of farmers for close marketing.....	1,200,000
Total.....	13,400,000

The 600,000 bushels short of the 14,000,000 is made up of wheat used as feed on farms, and some still unthrashed and some grown at points too remote to be shipped by rail. It is calculated that about 1,900,000 bushels of wheat ground in the province was exported in the shape of flour, some of it to British Columbia and Asia, the rest to the East.

One of the present objections urged against embossed or chased metallic vessels is that the inner face is often irregular, jagged or broken. In order to remedy these defects, Mr. Z. T. Hall, of the firm of Hall & Carpenter, Philadelphia, has patented a vessel, composed of an outer

wall which is embossed or chased, and an inner wall which is perfectly plain and smooth. The two walls are united at the top and bottom by beads or flanges, which close the joints between the two parts and give the vessel the appearance of an expensive article at a greatly reduced cost. The handle is secured to the outer wall by soldering or other suitable means. The invention is applicable to bowls, pitchers, teapots, coffee-pots and utensils of this general character.

The Theisen Surface Condenser.

The use of condensers with steam engines is frequently rendered difficult by insufficient supply of condensing water, of which from 20 to 25 times the amount of feed water is required. If it were possible to cool the condensing water quickly it could be used over and over again. In some cases this is effected by the use of cooling ponds, which, however, occupy considerable space. In Theisen's apparatus, described in *Dingler's Polytechnisches Journal*, the cooling is effected by an air-blast from blowing fans. The apparatus consists essentially of a plate-metal case, with surface condenser tubes fixed in the lower half of the case and immersed in water. The steam to be condensed circulates in these tubes, and the resulting water is pumped out by an air-pump, and finally fed into the boiler by the feed-pump. The condensing water is cooled by a number of metal disks, which revolve slowly on horizontal spindles, dip partly into the water condensing, and as they revolve carry a small amount of water on their surfaces; a current of air from two screw fans fixed at one end of the case containing the condenser impinges on the surfaces of the disks. The cooling action takes place by the evaporation of the moisture on the disks, and as these revolve they take up the heat from the heated condensing water to be cooled again by the air current. They are stated to take so much heat from the water as to keep it cool enough for condensing the steam. In Messrs. L. Mannstadt & Co.'s rolling mill, at Kalk, near Cologne, Germany, the apparatus has been adapted to engines indicating 470 horse-power. These engines, it is stated, were formerly worked as non-condensing engines, and the saving by condensing is about \$340 monthly in coal.

The tropical fruit trade of New York, which within a few years has passed from sailing vessels to steamers, is to undergo another radical change by the introduction of six new steamers owned by the West Indian Lloyd Steamship Company. Two of the steamers will ply between New Orleans and Savanilla, touching at intermediate ports and connecting at Truxillo with two other vessels of the line, which will run between New York and Livingston, Guatemala, Nassau, Jamaica, Truxillo and the Island of Inagua, the nearest of the West Indian Islands to New York and Great Britain. It is intended to make this island a central point. The vessels will register from 1800 to 3500 tons. The one building at Whitehaven will have four screws, and all the others are to have twin screws, with triple expansion engines. The four-screw vessel will have her propellers fitted into her hull within about 1 foot of the bottom of the keel. The screws will be hung on crank-shafts coming up through watertight compartments, and the machinery will be so arranged that the propellers can be hauled up the side of the vessel and a defective blade removed and a good one substituted. The vessels will be fitted with three banana decks and will be fitted with refrigerators from stem to stern.

BRAZIL.

PARA. August 7, 1888.—*India Rubber*.—During the last few days 160 tons of fine and coarse have been taken for New York at full prices.—*Per cable direct*.

EAST INDIES.

PENANG, June 22, 1888.—*Tin*.—There has been no demand for either Europe or America; fortnight's receipts reached 7000 piculs, of which Chinamen took 5000. The market for Laroot Tin opened at \$34.32½ per picul, and closes at \$31.80. There have so far been shipped to England 76,227 piculs. *Exchange*.—Four months' bank bills on London, 3/0%.—*Schmidt, Kustermann & Co.*

BATAVIA, August 10, 1888.—*Tin*.—The Billiton Company will offer at auction on the 20th inst. in this city, 14,000 piculs of Tin.—*Per cable direct*.

SPAIN.

BILBAO, July 21, 1888.—*Iron Ore*.—The position of Ore has undergone but little change during the week, quotations remaining unaltered. Rubios at 6/10 @ 7/3, and Campanil at 7/6 @ 8/. A few cargoes were taken of each, the latter at 8/. Week's exportation amounted to 71,387, against 98,897 the previous week; total shipments since January 1 sum up 2,135,387 tons, against 2,430,300 same time last year. *Pig Iron*.—The export for the week was 3626 tons, while coastwise 325 tons were shipped. The Vizcaya Company quotes Pig Iron 57 @ 60 pesetas per ton on the spot, and 55 @ 58 futures. Lingotillo at Huelva and Seville, 65 pesetas.

GERMANY.

HAMBURG, August 4, 1888.—*Iron*.—Pig Iron has remained dull in Rhenish-Westphalia; Spiegel in particular suffers from a lack of American demand, nor is it active for home use, and some makers may have to temporarily abandon turning it out after awhile, should there not be a favorable change soon. Meanwhile it remains unaltered, 56 marks per ton for 10 @ 12 % Manganese. Forge Pig is gradually increasing in stock; Siegen sold the same as low as 46 @ 47. Foundry Pig still moves off tolerably well at 51 @ 57. Both Bessemer and Thomas are rather weaker; Luxembourg sells at 38.70 @ 40, English Bessemer at 42/6. During the first six months German Pig Iron production, including Luxembourg, has been 2,106,714 tons, against 1,848,481 in 1886; June production was 350,404 tons, of which 172,889 Forge and Spiegel; 53,952 Bessemer; 102,564 Thomas, and 40,969 Foundry. Merchant Iron continues inactive; Hoop Iron is so much neglected at home that notable sacrifices have to be made to push it off for export; the quotation is 137.50 @ 140. Boiler Plates remain firm at 170 for 5 mm. diameter, and Tank Sheets at 150; the former remain in brisk request both for export and home use. Thin Sheets begin to sell with greater ease; a syndicate will soon raise prices. The disagreement among makers in the Wire Nail and Wire branches points to lower prices in prospect. Neither machine shops nor foundries have reason to complain of a lack of work, still the prices they get are not very remunerative. Car works were seldom so loaded down with orders. Steel works are getting on very well. Advances from Upper Silesia are in every way most satisfactory as regards the Iron trade and outlook for the same. *Petroleum*.—Tank steamers are gradually multiplying at the mouth of the river Weser, whence four of together 11,200 tons are trading regularly between American ports and Bremen and Hamburg, conveying Crude Oil at life rate of 600,000 barrels per annum, tank cars, of which there are 70 employed distribut-

ing the Oil inland. Another company has begun this trade with two steamers. As this tank transportation is gradually doing away with the shipment of Crude in barrels, empty barrels are getting scarce, and a close imitation of American is now made in Germany. Metals are firm and unaltered.—*Borsenhalle*.

Production of Chromium Pig Iron.

E. G. Odelstjerna states that, in the first attempts at Sweden to produce pig iron with a high percentage of chromium, it was found to be a matter of extraordinary difficulty to obtain a sufficient degree of heat. At a temperature at which wrought iron is a thin fluid, the contents of the crucible in which the experiments were made remained unchanged. On employing a furnace of the Wittenstrom type, however, small quantities of chromium pig iron were produced, but even then the temperature was not high enough at first to fuse the globules of metal together. This became possible in modifying the composition of the slag. The cost of the process as carried out in these furnaces was too high to enable it to compete successfully with the poorer chromium pig iron produced elsewhere in blast furnaces using coke as fuel. Regenerative crucible furnaces were therefore tried instead, but although the temperature attained was high enough to melt away the Dinas bricks used in the construction of the furnace, the chromium pig iron produced could not be obtained in a thoroughly fused condition, the reduced metal being always intimately mixed with slag. Complete fusion of the metal only takes place at a temperature at which the best graphite crucibles soften—at a temperature, that is, probably exceeding the melting point of platinum. By this means a pig iron can be produced containing 70 per cent. of chromium; it contains less carbon than the metal poorer in chromium, and in consequence of its greater percentage of this latter element, it acts less as a carbonizing material when added to the steel bath than would a metal containing, say, only 45 per cent. of chromium.

By the use of this chromium pig iron an open-hearth steel can be produced which will compete in every respect with the best English crucible steel, and in many cases even excel it. Chromium steel is harder than ordinary steel with the same percentage of carbon, but it is much more difficult to harden. To obtain a useful chrome tool steel the carbon must be kept at least 0.2 per cent. lower than would be used were no chromium present in the metal, and in its place must be added that amount of chromium which will give the requisite degree of hardness. A steel can be obtained in this way which will stand a much greater welding heat than will ordinary carbon steel, and be at the same time both harder and tougher. The percentage of carbon in a chrome steel should never exceed 0.9. The percentage of chromium need rarely exceed 1.5 per cent. If it is desired to produce a harder steel than that containing 0.90 per cent. of carbon and 2.0 per cent. of chromium, 0.2 per cent. of silicon must be present to insure freedom from blow-holes, the phosphorus, owing to the presence of the silicon, being at the same time kept below 0.3 per cent. The metal should be cast into ingots of small size, not exceeding 5 inches square, to prevent liquation during the cooling of the metal.

The Connellsville Coke Trade.—Of the 12,061 ovens in the region 9337 are in blast and 3724 idle, with an approximate total output of 93,723 tons. The figures for the last week were: In blast, 8921; out of blast, 4140; output, 86,342 tons. This shows an increase of 416 active ovens and 6986 tons of coke. All the larger operat-

ors are now running six days in the week. The shipments for last week aggregated 5350 cars, distributed as follows: To Pittsburgh and the rivers, 950 cars; to Western points, 2700 cars; to Eastern points, 1700 cars. The figures for last week were: Pittsburgh, 925; West, 2700; East, 1700; total, 5325. The total shipments for the month of July were 20,560 cars, distributed as follows: To Pittsburgh, 4000; West, 10,700; East, 5860. The daily average was 790 cars, against 787 in June, when but 19,160 cars were shipped. Prices continue at \$1 per ton, with suspicions that some operators are cutting a shade lower in the race for trade. The Western markets are reported dull. At Chicago coke is quoted at \$3.90 per ton, and at East St. Louis \$4.35 per ton. The crushed coke trade seems to be growing steadily. Transient trade continues good, about 75 cars of coke per day being the average. The shipments, however, vary greatly, running all the way from 28 to 150 cars per day.

A Modification of the Bessemer Process.—The Carlsson modification of the Bessemer process is employed in Sweden in the treatment of a charcoal pig iron containing about 1.5 per cent. of silicon, 0.1 to 0.15 of manganese, 3.9 of graphite and 0.1 of combined carbon. The slag produced in the production of this pig iron approximates more closely to a tri-silicate than a bi-silicate, alumina being considered as a base. After the pig iron has been charged into the converter it is blown for about five or six minutes, until the blue flame appears that marks the commencement of the combustion of the carbon. The blow is then stopped, and a definite proportion of the charge, varying with the quality of the metal it is desired to produce, is poured into a ladle of peculiar construction, so arranged as to show the weight of the metal charged into it, the slag being carefully removed. This portion of the charge usually contains 4.15 per cent. of carbon, 0.05 of silicon and 0.07 of manganese. The remaining portion of the metal in the converter is then blown until most of the carbon has been eliminated and the bath converted into malleable iron. The portion of the metal previously removed, together with any necessary additions required for special purposes, is then added to the bath. When the reaction that ensues is ended the metal is ready for pouring. Before this addition is made the bath usually consists of metal containing a trace of silicon, 0.03 per cent. of manganese, 0.05 of carbon, and, as a maximum, 0.02 of sulphur. As this metal is usually red-short some rich manganese iron is added before the addition of the second portion of the metal from the ladle. The percentage of silicon in the final product is usually about one-tenth of that of the carbon, so that steel containing 0.2 of carbon would also contain 0.02 of silicon.

The effects of stimulated emigration were forcibly shown in the testimony given last week by Dr. Hoyt, for many years past secretary of the New York State Board of Charities. He stated that the foreign-born inmates of our almshouse, workhouses and correctional institutions outnumbered the natives four to one. In our insane asylums there are two foreigners to one native. Of the offenders convicted in our courts there are three foreigners to one native, and outdoor relief to the poor is administered to five foreigners to one native. This vast disproportion of the foreign element among the paupers, lunatics and criminals that are a burden upon the community he attributed mainly to the efforts made in Europe to get rid of these classes by sending them to this country.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, August 13, 1888.

Business shows a marked improvement, with Steel Rails as almost the sole exception. In consequence of the heavier demand now being experienced prices are firmer, and a decided upward tendency is noted in many branches. Until Steel Rails begin to move more freely, however, it is not to be expected that prices of heavy material will attain much higher figures.

Pig Iron.—The market has been very active during the past week, the volume of business greatly exceeding the average of its immediate predecessors. While but few large sales are reported, there has been a multiplicity of transactions ranging from 100 to 500 tons. Buyers are now seeking sellers and freely offer old rates in the hope that they will be accepted; but few furnace agents find themselves able to supply their trade at such figures. Advances of 25¢ @ 50¢ are frequent, and if present conditions continue the upward movement will be general. Lake Superior Charcoal has been sold so freely that but a small part of the coming twelvemonth's output remains to be marketed, and for this a much higher price will have to be paid, if appearances are not altogether deceptive. Soft Irons are considerably firmer, and makers are threatening to advance in the near future, claiming to have now sufficient warrant for such action. Southern Coke Irons are scarce and higher, the supply of low grades having been exhausted by the demand from other markets. Lake Superior Coke shows no advance as yet, but the situation in it is liable to change quickly as the available supply is by no means large, with the Calumet Furnace out of blast, although the new Mayville Furnace is performing an active part in meeting the local demand. Notwithstanding the dullness in the Steel Rail trade, the price of Bessemer Pig Iron continues to harden. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers \$19 @ \$20; Alabama Car-Wheel, \$26.25; Southern Charcoal Foundry, No. 1, \$18 @ \$19; Jackson County Softeners, No. 1, \$18 @ \$18.50; Hocking Valley, Soft Foundry, No. 1, \$17 @ \$17.50; American Scotch (Blackband) No. 1, \$18 @ \$19; other Ohio Scotch Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$17 @ \$17.50; No. 2, \$16 @ \$16.50; No. 3, \$15 @ \$15.50; Southern Coke, No. 2, \$17; No. 2½ and Open Bright, \$16.50; No. 3, \$15.50 @ \$16.

Bar Iron.—Large orders have been placed for delivery during the next 12 months by the agricultural implement manufacturers. Terms are private, but it is intimated that about 1.60¢, f.o.b. Chicago, was the prevailing rate, some concerns having been able to buy at a slightly lower figure. Manufacturers now have a general impression that prices can be sustained on a slightly higher basis than has recently prevailed, as so much of the productive capacity of the mills has been absorbed by these large orders, and as the general trade seems also disposed to take hold more freely. Quotations of 1.65¢, half extras, f.o.b., Chicago, for carload lots, are general, few sellers being willing to name anything lower. Store prices are unchanged, being 1.75¢ to 2¢, according to quantity and quality.

Structural Iron.—A steady trade is in progress, but small lots are most frequently called for. The mills are disposed to ask slightly higher prices. Store quo-

tations are as follows: Angles, 2.40¢ @ 2.70¢; Tees, 2.60¢ @ 2.90¢; Beams and Channels, 3.80¢. Mill lots are as follows, f.o.b. Chicago: Angles, 2.20¢; Universal Plates, 2.30¢; Tees, 2.45¢; Beams, 3.40¢.

Plates, Tubes, &c.—An unusually good business has been done in Plates, and dealers found their stocks heavily depleted at the end of the week. The mills are holding prices very stiffly, but no changes have been made in store prices, which are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 % and 10 % off on 2½-inch and larger and 62½ % off on 2-inch and smaller.

Sheet Iron.—A decidedly stiffening tendency is to be noted in this line, which is due to a variety of reasons. First, this is now the time of the year when a most active demand is experienced for fall delivery. Second, a number of the mills represented here have oversold their capacity, and others have found their deliveries interfered with by the derangement in business caused by the strike in July. Third, the Aurora mill in Indiana, whose owners recently made an assignment, had large contracts for delivery to Chicago merchants, who will have to make other arrangements if the mill is not very soon put in operation again. From these causes a scarcity has arisen, which is quite seriously felt, and prices are at least \$3 per ton higher than when they were at the lowest point of the summer. Manufacturers' agents are generally asking 3¢ for No. 27 in carload lots, f.o.b. Chicago. Jobbers name 3¢ for No. 24, 8.10¢ for Nos. 25 and 26, and 8.20¢ for No. 27. To close buyers these figures are slightly shaded.

Galvanized Iron.—Prices have stiffened up a little in sympathy with Black Sheets, but small lots are still quoted at 60 % and 5 % off, and Charcoal at 60 % and 10 % off.

Merchant Steel.—Some large contracts have been placed by the agricultural implement manufacturers, and others are still in the market. The trade from store has been much better than usual. Prices from store are unchanged, although the heavy contracts referred to were taken at quite low rates. Quotations from store are as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 11¢.

Steel Rails.—A few inquiries have made their appearance, but actual business is very hard to get. Prospects are far from bright. Quotations range from \$31 to \$31.50, but it is intimated that these rates might be shaded on competitive business in the South.

Old Rails and Wheels.—A number of sales of Old Iron Rails, in lots of 300 to 1000 tons, are reported at \$19.75 @ \$20. The railroads now do as little repairing as possible, which is making Old Rails very scarce, so that prices may go still higher in view of the existing demand for them. Old Car-Wheels are in good demand, and some sales have been made at \$19 @ \$19.50. They are also scarce and prices show an upward tendency in sympathy with Charcoal Pig Iron.

Scrap.—Inquiries have improved, but buyers all seek cheap material. No sales of No. 1 Wrought are reported. The demand for Cast is very light at present. Mill Iron is in most request, and next come Borings, Turnings, &c. Mixed country Scrap is quoted at \$11.50 @ \$12.50. Selling quotations for carefully selected are as

follows, per ton of 2000 lb: No. 1 Forge or Railroad Shop, \$17 @ \$18; Track, \$16.50 @ \$17; No. 1 Mill, \$13.50 @ \$14; Light Wrought, \$9 @ \$10; Horseshoes, \$17; Axles, \$23; Cast Machinery, \$13.50 @ \$14; Stove Plate, \$10 @ \$10.50; Cast Borings, \$9; Wrought Turnings, \$10 @ \$11; Axle Turnings, \$12 @ \$13; Coil and Leaf Steel, \$14 @ \$15; Locomotive Tires, \$15.

Hardware.—Business in Shelf Hardware continues very active for the season, jobbers reporting their force well occupied in taking care of the orders received through the regular channels. Builders' Hardware is moving more freely as buildings begun early in the season approach completion. Prospects are very bright for a good fall trade, reports from all sections tributary to this section being of a most encouraging character. Prices show no special change.

Nails.—Manufacturers' agents have had a good demand and most of them report large sales. They still quote \$1.75, Wheeling, for Steel Nails, but this price is being shaded by factories more favorably located for this market. Much interest is taken in the proposed Cut-Nail combination among the manufacturers, and the belief is growing that prices may be advanced on or before the 1st of September through that influence. Jobbers report a fair and increasing trade. Some of them have recently been selling Steel Nails at \$1.95 and Wire Nails at less than \$2.50 from store, but they have all stiffened up and now name \$2 as the bottom price for Steel and \$2.50 for Wire Nails.

Barb Wire.—In this immediate section no business is now being done in this line, as the retail merchants are without any demand from their customers, who are busily employed in securing their crops. Nominal quotations are still 3¢ for Painted and 3.75¢ for Galvanized, in small lots.

Pig Lead.—A heavy week's trade is reported, sales aggregating 1200 tons, spot and for future delivery. Prices ranged from 4¼¢ to 4½¢. Manufacturers report a fair demand for Lead products, with a promising outlook for the fall.

Copper.—A moderate business is in progress, consumers being very conservative and carrying only light stocks for fear of lower prices.

The freight rate on scrap iron from Chicago to Youngstown has been reduced to \$1.85 per ton in consequence of a falling out between some of the railroads connecting the two points.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., August 14, 1888.

Pig Iron.—The market appears to have become pretty well settled on the basis of prices quoted during the past two or three weeks. There is not the slightest indication of change at the moment, and the probabilities seem to be that prices will continue as they are for some time to come. Buyers are no way anxious to place orders in advance, and as holders are not accumulating stock they are quite as indifferent about selling. There is some prospect of an increase in production, however, but as consumption is likely to increase in proportion, there is no reason to expect that the supply will be any more excessive than it is at present. The position is, therefore, a very healthy one, as matters are in a shape to respond at once to favorable influences from other sources, and so far as can be seen there is nothing likely to affect the market unfavorably, reports from all quarters showing a moderate degree of activity, with a very confident feeling in regard to the future. The general complaint is in regard to prices. Almost anything can be sold, providing

the price is made low enough, but having got prices down it is no easy matter to get them up again. As to the quotations for Pig Iron they remain about as they were a week ago, steady and firm. No. 1 Foundry at tide commands from \$18 to \$19, according to brand; No. 2, \$17 @ \$17.50; Gray Forge, \$15.75 @ \$16.25. It is a difficult matter to secure anything fully up to standard at inside quotations, and almost as much so to secure outside rates, except for small lots of choice quality, the bulk of the business being at medium rates. Southern Irons could be had at less money, say \$15 @ \$15.50 for Gray Forge and \$17.50 @ \$18 for No. 1, but there is no demand, neither is there any pressure to sell, although in a casual way agents name the above figures as their ideas of value.

Foreign Iron.—There is more disposition to place orders than we have seen for some time, although buyers and sellers are a long way apart in their views. Bids of \$18, c.i.f., duty paid, have been made for round lots, against offers to sell at \$19.50, with a probability that both sides would concede something if there was a fair prospect of business being closed.

Blooms.—There is a good demand for steel blooms, and prices are steady at rates quoted herewith, say, Slabs and Billets from \$29 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29 @ \$30 for Nail Slabs; \$31.50 @ \$32.50 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—There is a good demand, and with light offerings prices are again a shade firmer, \$28 at Philadelphia being the usual asking quotation, with sales at from \$27.50 to \$28. delivered.

Bar Iron.—There is a good deal of inquiry in addition to a very satisfactory amount of sales, while the prospect for a large consumption during the fall months seems to be quite encouraging. Prices have not improved, however, and that appears to be the most unsatisfactory part of the business, and for the present the outlook in that respect is not what could be desired. As we said last week, the large mills will have to be filled up before any advance can be made, and while they are perhaps gaining a little, they are not getting very much ahead, the week's deliveries on an average being but little more than the week's sales, with possibly an exception here and there. Prices range from 1.75¢ to 1.85¢ for Best Refined Bars. Buyers of large lots can get in at the inside figure, while smaller lots or special makes will command the outside quotation. Skelp Iron is still in good demand, with sales aggregating nearly 2000 tons of Grooved at about 1.08¢ delivered, and still further orders waiting to be placed at about the same figure.

Plate and Tank Iron.—There is a fair general demand for Plates in small and moderate sized lots, and mills are gradually getting work ahead. Prices are therefore a shade firmer and in some cases a trifle higher, although there are irregularities, according to the immediate requirements of the mills. Those that are pretty well filled up, for instance, are naturally firmer than those less favorably situated, but, as we said before, the average position is one of improvement, both as regards prices and the volume of business. In ordinary cases prices are about as follows: Ordinary Plate and Tank Iron, 2¢ @ 2.10¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3.4¢; Fire-Box, 3.4¢ @ 4.1¢.

Structural Iron.—There is no special movement in this department, although in sympathy with the rest of the market the feeling is a little better. The week's deliveries were about equal to the sales, so that there is rather sharp competition to secure work ahead. Prices are somewhat irregular, but in ordinary cases about as follows: 2¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.8¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The demand is fair and on the whole averages pretty well with other departments. Good makes command full prices, but other descriptions are irregular, and in some cases have been offered at extremely low figures. Quotations for small lots, best makes, are about as follows:

Best Refined, Nos. 26, 27 and 28... 3½¢ @ 3½¢
Best Refined, Nos. 18 to 25... 3¢ @ 3½¢
Common, ½¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28... 4½¢ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25... 4¢ @ 4½¢
Best Bloom Sheets, Nos. 16 to 21... 3½¢ @ 3½¢
Blue Annealed... 2.8¢ @ 3¢
Best Bloom, Galvanized, discount... 62½¢
Common, discount... 67½¢

Merchant Steel.—A general improvement is noticeable with a large demand for Tool Steel as the leading feature. Prices for lots from store are quoted as follows: Tool Steel, 8½¢; Machinery, 2½¢; Crucible Spring, 4½¢; Open-Hearth Ordinary Spring, 2½¢ @ 2½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—In this vicinity business is very dull, although for the time being mills are moderately well employed. The feeling is said to be a little firmer, but there are no indications of buyers coming in to any extent even at the present low figures. The usual quotations are \$29.50 @ \$30 at mill, but good buyers could doubtless obtain concessions on desirable orders, as to quantity and date of delivery.

Old Rails.—The market has not improved very much, although there is a somewhat better demand. Holders ask \$21 for T's, ex-ship, and from \$22 to \$22.50 in store, with bids of \$20.50 ex-ship for a lot now in port. Sales at \$22 @ \$22.50 delivered at mills in the interior.

Scrap Iron.—Market quiet, but sales continue to be made at the old prices—viz.: \$18 @ \$19 for cargo lots; \$20 @ \$21 for carload lots, delivered, or for choice \$21.50 @ \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$19 @ \$20; Cast Scrap, \$14 @ \$15; do. Borings, \$9 @ \$10; Old Fish Plates, \$24 @ \$25. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—There is an increased demand for all sizes of Pipe, and mills are pretty generally well filled with orders. A firmer tone is noticeable, although, as yet, there is no quotable change in prices. Discounts are as follows: Black Butt-Welded, 55%; on Galvanized do., 45%; on Black Lap-Welded, 65%; on Galvanized do., 52½%; on Boiler Tubes, 60%.

Nails.—There is some inquiry for Nails, but, as yet, very little business has resulted. Prices are weak and unsteady, and, while the sharp competition to secure trade continues, any material advance seems very unlikely. The Western pool, for some unknown reason, has failed to organize.

Park Bros. & Co., Limited, Pittsburgh, Pa., have recently opened a branch house, located at 523 Arch street, Philadelphia, Pa., where they carry a complete stock of Crucible Steel, Copper, Open-Hearth Steel and the other specialties manufactured by them. Mr. Robt. K. Story, who has been appointed manager, is well known to the Iron and Steel trade in the East, having

been manager of Pittsburgh Tube Company, Pittsburgh, Pa., prior to which he occupied the same position with the New York branch house of the American Tube and Iron Company.

Edmund D. Smith & Co., No. 224 S. Third street, Philadelphia, have been appointed exclusive Eastern agents for the De Bardeleben Coal and Iron Company, of Bessemer, Ala., the agency covering the entire Atlantic seaboard. The De Bardeleben Company have one of the finest plants in the South, embracing two stacks of 150 tons each now in operation and two more expected to be finished this year. The ores they will use are very rich in iron, low in phosphorus, while their own ovens and coal mines furnish their coal. Their intention is to furnish a first-class foundry and mill iron, quality being of the first importance.

Louisville.

LOUISVILLE, KY., August 13, 1888.

Pig Iron.—The market remains steady, though there has not been as heavy buying during the past week as marked the purchases of the preceding one. Consumers who have laid in what Iron they desire for the next three or four months are waiting to see which way the market turns before making further purchases. If Iron advances in the East 50¢ per ton there will be heavy buying, as another slight advance will be considered undoubted evidence that bottom has been reached. Softeners are in active demand, owing to danger of low water preventing shipments of this grade of Iron from the Ashland district. Consumers of Iron are much surprised at the small amount of Iron offered by Southern furnaces. The reason is this, that the older furnaces are largely oversold at better prices than can be obtained for the Iron now. So far there have been but three or four new furnaces gone in blast, and it is now thought that the several new furnaces which were expected to make Iron this year will not be in blast before 1889, owing to scarcity of Ore and Coke. Among the larger sales during the past week have been 2000 tons Silver Gray, 1500 tons No. 2½ and 1000 tons No. 2 Foundry. Old Wheels are in active demand at about \$19.

Southern Coke, No. 1 Foundry...	\$16.25 @ \$17.25
" No. 2 "	15.25 @ 16.25
" No. 2½ "	14.75 @ 15.25
Hanging Rock Coke, No. 1 Foundry...	16.75 @ 17.25
Hanging Rock Charcoal, No. 1 Foundry...	20.50 @ 22.75
Southern Charcoal, No. 1 Foundry...	17.50 @ 18.00
Silver Gray, different grades...	18.75 @ 14.50
Southern Coke, No. 1 Mill, Neutral	13.00 @ 14.00
" No. 2 "	12.50 @ 13.50
" No. 1 " Cold Short	12.50 @ 13.50
Charcoal, No. 1 Mill	18.75 @ 15.00
White and Mottled, different grades	12.25 @ 12.75
Southern Car-Wheel, standard brands...	21.75 @ 24.75
Southern Car-Wheel, other brands	18.75 @ 20.75
Hanging Rock, Cold Blast...	22.75 @ 24.75
Hanging Rock, Warm Blast...	18.75 @ 19.75

Pittsburgh.

Office of The Iron Age, 77 Fourth Ave.,
PITTSBURGH, August 14, 1888.

There has been no important change in the general industrial situation, with the exception that the Window Glass Factories, after the regular summer vacation, have been started up. With possibly one or two exceptions the Iron mills have all signed the wage scale and resumed operations. The Steel mills are all at work, some of them quite busy, and the largely increased consumption of Pig Iron has caused a good many of the furnaces that were out of blast to blow in. It is pretty generally admitted that our manufacturers will have a good fall and winter trade.

Pig Iron.—The general position of the market does not differ much from that of a week ago; there is no abatement in demand, buyers continue more numerous

than sellers, and prices are still tending upward. As compared with the prices ruling in the early part of July, there has been an advance of 75¢ per ton on good brands of Mill Iron, and, as furnacemen are inclined to the belief that prices will go still higher, it is not strange that they are indifferent about making additional sales. Some of them, while willing to sell to a fair extent for immediate or near-by delivery, are refusing to contract for future delivery. A considerable proportion of the Iron reported sold during the past three or four weeks was taken on speculation, and will be held at furnaces subject to orders of purchasers. Consumers, however, have not been idle during the past few weeks, and most of them are pretty well covered; some of them have covered their requirements for several months to come; however, there are those who let the market get away from them by holding back—they could see no good reason why there should be an advance, but it took place all the same, and these same parties will be obliged to stock up at the enhanced cost, which will give competitors who bought before the advance an advantage over them. Foundry Irons have not advanced much as yet, nor is it likely that they will until there is a considerably improved demand. There is an evident disposition to boom the Bessemer market, and sales are reported at a higher price, there is reason to believe, than can be obtained. We quote prices as follows:

Neutral Gray Forge.....	\$14.25 @ \$14.75, cash
All Ore Mill.....	15.25 @ 15.75, "
White and Mottled.....	13.50 @ 14.00, "
No. 1 Foundry.....	16.75 @ 17.00, "
No. 2 Foundry.....	15.75 @ 16.25, "
No. 3 Foundry.....	15.00 @ 15.25, "
Charcoal Foundry.....	20.00 @ 24.00, "
Cold Blast Charcoal.....	25.00 @ 28.00, "
Bessemer Iron.....	17.00 @ 17.25, "

Included in the sales reported were 1700 tons Gray Forge at \$14.75, cash, and 5000 tons Bessemer at \$17.25, cash. It is doubtful whether standard brands of Gray Forge can be had within the next week under \$15, cash, although up to the present writing we are not advised of any actual sales having been made above \$14.75, cash.

Muck Bar—Is firmer and more active; we are advised of sales at \$26.50 @ \$27, cash, which may now be regarded as the ruling quotations, with a prospect of going still higher in sympathy with Pig Iron.

Manufactured Iron—Nearly all the mills are again in operation, and there is no scarcity of orders, but there has been no improvement as yet in prices, although they are firmer, in sympathy with the raw article; indeed, manufacturers generally are not very anxious about filling up their order books at present prices, which, it is claimed, afford little or no margin for profit. It is evident that if the raw article continues to advance the products will sympathize, and the effect is to make buyers more anxious to buy and sellers less anxious to sell. We continue to quote upon a basis of 1.70¢ @ 1.80¢ for Bars, 60 days, 2% off for cash. These quotations are for first quality Iron.

Nails—There is no improvement to note in trade so far as relates to Pittsburgh. Manufacturers are refusing to sell below the card, while buyers are able to do considerably better elsewhere. The card remains unchanged at \$1.90, 60 days, 2 per cent. off for cash, for car lots and upward, but buyers, it is claimed, can obtain all they want at competing points west of Pittsburgh at \$1.75. Manufacturers think they can make Nails as cheap as any of their competitors, but they claim that even at full card rates there is only a fair margin for profit, and rather than cut below they will let their factories stand idle, as some of them are doing.

Old Rails—There is an increasing demand, caused by the starting up of the mills in the Shenango and Mahoning val-

leys, where the consumption is much larger than in Pittsburgh, and prices are firmer and higher. Sales of some 2000 tons American Tees at \$21.50, cash, and they are not offering very freely at any price. Sale of Old Steel Rails at \$19.50. Sellers of Old Iron Rails report the supply light, and they look for still higher prices.

Steel Rails—Are quoted at \$31 cash at mill here for Heavy Sections, and a desirable order might be placed below the quotation named. The mill here is still running full time.

Billets, &c.—There is a continued steady demand for Bessemer Steel Billets, which may be quoted at \$28.25 @ \$28.75, cash, as to quality, size and delivery. Sale of Nail Slabs at \$27.65, delivered free on cars at Wheeling. Steel Rail Crops are quoted at \$17.75 @ \$18, and Bloom Ends about the same, with an increasing demand for both.

Merchant Steel—There is a fair demand, but no recent change in prices. Best brands of Tool Steel, 8½¢ per lb; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Open-Hearth Machinery, 2½¢.

Railway Track Supplies—No change in prices, which are still quoted at 2¢ for Spikes, 30 days, delivered; Splice Bars, \$1.80 @ \$1.90; Track Bolts, \$2.85 with Square and \$2.95 with Hexagon Nuts.

Old Material—There is an improved demand for all kinds of Old Material, and prices are firmer. We can report sales of No. 1 Wrought Scrap at \$19, net ton; Cast Scrap, \$15, gross; Old Car Wheels, \$19 @ \$20, gross; Leaf Springs, \$20.50, gross; Mixed Scrap Steel, \$16, gross; Short Piece Steel Rails, \$17 @ \$17.25; Old Car Axles quoted at \$23 @ \$24, net ton; Wrought Turnings, \$13 @ \$14.

Detroit.

WILLIAM F. JARVIS & Co., under date of August 13, report as follows: Beyond the strong feeling of certainty that the market is a rising one and cannot long be stationary now that it has commenced in the right direction, there is very little to report in the way of a change from ours of a week ago. Lake Superior Charcoal has been occupying the attention of buyers of that grade to a considerable extent during the past week. Some concerns are complaining that they cannot obtain their regular Irons at the lowest prices, and, indeed some brands cannot be obtained at all. Some large sales have been made, selling the furnaces considerably ahead for all they can deliver during navigation this year. There is decidedly a very much better feeling. With the strength of the Lake Superior Charcoal market Old Wheels very naturally sympathize, and a straight advance of from 50¢ to \$1 per ton, and hard to obtain at the advanced price, can be noted. Southern Iron has cut no important feature here during the past week, but from our Southern correspondents we learn of the continued strength and some advances. Again noting a strong market, quotations to-day will be as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @ \$20.50
Lake Superior Coke, all ore.....	19.25 @ 19.75
Lake Superior Coke, cinder mixed.....	18.00 @ 18.50
Standard Ohio Black Band.....	19.25 @ 19.75
Southern No. 2.....	17.75 @ 18.25
Southern Gray Forge.....	15.75 @ 16.25
Southern Silvery.....	17.00 @ 17.50
Jackson County (Ohio) Silvery.....	18.50 @ 19.00
Old Wheels.....	19.25 @ 20.00

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, August 13, 1888.

The hopes of Southern farmers are being fully realized in the continuation of favorable weather for the development of their crops, which promise to exceed those of any previous year. Both corn and

wheat in Tennessee exceed in quantity the record of any previous year, and the same may be said of the crops generally throughout the entire South. The effect is already discernable among merchants. Goods of all kinds are being ordered, and holders of bills and notes past due are looking forward to their early settlement.

Pig Iron—Whether or not the better feeling that prevails among the Pig Iron producers has come to stay, there is no questioning the fact that prices have taken a decided upward turn. Sales are being made at the advance with but little higgling. Inquiries are more frequent, and furnace yards are cleaner than at any previous time during the year. Sales are now being made on a basis of \$14.50 for No. 2 and \$15.50 for No. 1, at the furnaces. Inquiries from Boston, New York and Philadelphia have again become quite numerous, and several round lots have been sold to go into those markets. Some five or six of the Southern furnaces will blow out during the present week for repairs, which will simply be letting go for a few days to take a fresh hold when greater results may be expected. Taking everything into consideration, the outlook for the future is certainly on the cheerful side, and everybody is looking forward to much increased activity in business during the balance of the year.

Cincinnati.

CINCINNATI, August 13, 1888.

Pig Iron—The volume of business in the local Pig Iron market during the past week has scarcely been so large as during the preceding week and there has been no further advance of moment in prices, but the market has continued to harden, and the advance established during the past few weeks has been further secured by additional transactions, and, at the close, sellers are disposed to temporarily withdraw from the market on large contracts for future delivery, except at further advance in prices. Buyers, however, are willing to pay the advance already established, but are not disposed to put the market up upon themselves, and therefore less has been done. No. 2 Southern Coke Foundry Iron has been sold at \$16, and there is a report that even \$16.25 has been obtained. No. 1 Mill Iron has been sold at \$14.75 mainly, and No. 2 Mill is quotable at \$14.25 nominally. Lake Superior Iron has sold well and an advance of 50¢ per ton has been realized. There has been less doing in Car-Wheel Iron, but there is still an outlet for all obtainable. At present Mill Iron is scarce and while there is a good inquiry for it, there has been less doing. Ohio Irons have sympathized in the general advance and higher prices have been realized. The market has been less depressed by Softeners and off grades of Iron, and a confident feeling is entertained for the future. There have been no large contracts which have been made public, with the exception of about 7000 tons of No. 1 Southern Mill in St. Louis, which was sold on the basis of \$14.75 here, cash. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$16.50 @ \$17.00
Southern Coke, No. 2.....	16.00 @ 16.25
Southern Coke, No. 3.....	15.00 @ 15.25
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley ..	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	20.50 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.00 @ 21.00
Tennessee and Alabama Charcoal, No. 1.....	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 2.....	16.50 @ 17.50

Forge.

Strong Neutral Coke.....	13.75 @ 14.25
Mottled Neutral Coke.....	13.00 @ 13.50
No. 1 Mill Coke.....	14.75 @ 15.00
No. 2 Mill Coke.....	14.25 @ 14.50

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @	23.00
Hanging Rock, Cold Blast.....	22.00 @	25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @	21.00

Manufactured Iron.—There has been a moderate volume of business in Bar, Sheet and Agricultural Iron, and the market has ruled steady. Bar and Sheet Iron—Common Bar Iron, 1.90¢ @ 2¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3¼¢ @ 4¼¢ @ lb.

Nails.—A little firmer tone has prevailed, but there has been only a moderate volume of business, and prices are unchanged. Jobbing prices are based upon 12d @ 40d, which sell at \$2 ¾ keg, with 10¢ rebate in carload lots at mills; 50d @ 60d, 25¢; 10d, 10¢; 8d @ 9d, 25¢; 6d @ 7d, 40¢; 4d @ 5d, 60¢; 3d, \$1, and 2d \$1.50 per keg more. Steel Nails sell at \$2 and Steel Wire Nails at \$2.65 @ \$2.75 ¾ keg.

Old Material.—There has been an increased demand for Old Rails, and the market has continued to rule stronger, with sales of Old Rails reported at about \$20 here. There has been less demand for Old Wheels, and prices have been quotable at \$18.50 @ \$10, cash, here.

New York.

Office of *The Iron Age*, 66 and 68 Duane street, New York, August 15, 1888.

American Pig.—Sellers generally report some falling off in the activity which characterized the latter half of July and the opening of August, and sales have been moderate. There has been no advance in standard brands of Northern Foundry Irons in this market, but the heavier buying alluded to has relieved the pressure existing prior to it and a better feeling does exist. Buyers have largely shaken off their apathy, and are making bids which are closer to sellers' views. We continue to quote standard to choice Northern Foundry, tidewater delivery, \$18 @ \$18.50 for No. 1, and \$16.50 @ \$17.50 for No. 2, with a concession of 50¢ to \$1 for Southern and outside Irons. As yet no freight reductions have been made openly on Southern Irons, but some cutting is expected in the near future, although it may only be of short duration. An interesting feature lately have been the sales of Lake Superior Charcoal Iron in this and other tidewater markets, a sale of 1000 tons at Wilmington, Del., being mentioned among others. These Irons can be laid down at a shade under \$20, while Alabama Charcoal is quoted \$25.85, equal to \$22 at furnace.

Bar Iron.—We continue to quote for carload lots, half extras, on dock, 1.60¢ @ 1.65¢ for Common; 1.65¢ @ 1.7¢ for Medium, and 1.75¢ @ 1.9¢ for Refined.

Structural Iron.—A fair amount of business doing, chiefly in architectural shapes, while in bridge work a 1000-ton order for Oregon, taken lately, may be mentioned. We quote for round lots, on dock: Sheared Plates, 2¢ @ 2.10¢; Universal Mill Plates, 2.10¢ @ 2.15¢; Angles, 2.5¢ @ 2.15¢; Tees, 2.5¢ @ 2.7¢, and Channels and Beams, 3.3¢.

Plates.—We quote for round lots, on dock: Iron Tank, 1.9¢ @ 2¢; Shell, 2.15¢ @ 2.30¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.7¢ @ 3¢, and Fire-Box, 3.7¢ @ 4¢. Galvanized Sheets are 65 ¢ @ 65 and 5 ¢.

Steel Rails.—Transactions during the week closed by Eastern mills aggregate about 10,000 tons, the bulk of them for Southern delivery, at least some of them being reported to have been closed at a low figure, tidewater delivery. From the West comes the report of a sale of 14,000

tons to the Union Pacific and allied lines by a Chicago mill, while press dispatches from the Pacific Coast announce the closing of a 30,000-ton contract by the Coast branch of the Moss Bay Company, now building for a new road in that section. There are a few *bona fide* inquiries on the market, not taking into consideration a number of schemes involving long-time payments, with new bonds as collateral, which the Rail mills will not entertain. We quote, at Eastern mill, \$28.50 @ \$29 for large lots, standard Sections.

Merchant Steel.—Manufacturers complain that the season for Sleigh Shoe and Cutter Shoe Steel is exceptionally backward this year. Usually contracts are placed in July and early in August, but thus far buyers have held back persistently, and little business has been done.

A meeting of the Bessemer Merchant Steel Association was held in this city today, the leading mills being represented. It was agreed to maintain present prices and adhere to existing schedules of extras, the point being made that all recent contracts for raw materials had been closed at an advance. The outcome of the meeting puts at rest rumors industriously circulated with an object that a disruption of the association was imminent.

Wire Rods.—We quote \$39.75 @ \$40 for early shipment of foreign Rods.

Old Rails.—Aside from a few small sales no business is reported. We quote nominally \$21 for Tees.

Fastenings.—Spikes are selling in a moderate way at \$2.05 @ \$2.10, delivered, with a stiffening tendency. There is some talk of advancing the price to a minimum of \$2.10. Angles continue 1.90¢ @ 1.95¢ delivered.

Warren, Wood & Co., Boreel Building, Broadway, this city, have been appointed sole agents of McKeefrey & Hofins, lessees of the Leetonia furnaces, Ohio, producing the Seneca brand of Pig Iron.

Financial.

Nothing occurred during the week just closed to dim the brightening prospects of a good fall trade, confidence being strengthened rather than otherwise by later reports concerning the leading crops—wheat, cotton and corn—as well as by the additional evidence that the promised surplus in America will find a ready market in Europe. It is now estimated that the United Kingdom will require the coming year at least 130,000,000 bushels of wheat. A dispatch from United States Consul F. H. Mason, at Marseilles, France, states that the French wheat crop this year is estimated at 250,000,000 bushels, and that the requirements of France from other countries the coming year will be 70,000,000 bushels.

A decision rendered on Monday by Judge Wallace, of the United States Circuit Court, in the case of the receiver of the Bank of Albion against a firm of Wall street brokers, lays down a very wholesome principle. The president of the Albion bank speculated with the bank's funds through the firm of brokers, and the ultimate consequence was the wreck of the bank through his default. The decision sustains a verdict by which the brokers are compelled to refund the money of the bank which they received from the president in payment of his personal obligations. This was received in the form of checks of the Albion bank which showed on their face that they were not personal checks and that the funds which they transferred belonged to the bank, and the brokers knew that the accounts to be settled were the personal accounts of the president. The question is, said Judge Wallace, whether

it was legally right and honest for them to take the checks in question in payment of the personal obligations of the bank officer who made them. * * * Every person who takes such an obligation must ascertain at his peril that the agent who has made it was authorized to do so, and the moment that it appears that the contract has been made for the agent's own use and benefit that moment his authority is impeached. No principle of the law of agency is better settled than that no person can act as the agent for another in making a contract for himself. Therefore it is that a bank president or cashier has no implied authority to bind his corporation to negotiate paper made for his own use, and if it appears upon the face of the paper that it is payable to the individual who has made it in an official capacity the obligation is nugatory and no purchaser can enforce it.

The Stock Exchange markets have been only moderately active, although generally strong. The strangers were somewhat unfavorably influenced by the Government agricultural report. Reading and other coal shares improved. On Monday the entire Oregon group, including Northern Pacific preferred, reflected the advance in Short Line, which was based partly on reports of favorable earnings, which may soon amount to sufficient to relieve Union Pacific of the necessity of meeting its deficit annually, and partly on the prospect of an agreement regarding a division of territory between Union Pacific and Northern Pacific. The Reading buying is believed to have been largely for London houses. On Tuesday the long expected reaction took place and a moderate decline was established, the market closing easy.

Government bonds were firm and are quoted as follows:

U. S. 4½, 1891, registered.....	106¾
U. S. 4½, 1891, coupon.....	107¼
U. S. 4s, 1907, registered.....	127¾
U. S. 4s, 1907, coupon.....	127¾
U. S. currency 6s.....	120

Respecting crops in the United States, the recognized authority in Cincinnati says, corn maintains its favorable position; the oat harvest will fall but little short of previous calculations, and the same of winter wheat, while as to spring wheat a larger production than last year can scarcely be expected. The report issued on Friday by the Agricultural Bureau placed the condition of spring wheat at 87.8, against 78.8 the same time last year, while the condition of corn is placed at 95.5, against 93 last month and 80.5 at the same time last year. The final report of the Indiana Department of Agriculture puts the wheat crop about 32,000,000 bushels larger than that of last year. The Michigan State report indicates about 18,000,000 bushels of winter wheat for the crop, against 16,000,000 last month. New York dry goods jobbers report an improved demand from the South and West, so that now the fall trade in this line may be considered fairly inaugurated. The outbreak of yellow fever at Jacksonville, Fla., will naturally cause some apprehension, but the Government authorities are confident of their ability to maintain an effective barrier. At this port all steamers coming from the yellow fever regions will be subjected to a rigid examination.

Wheat and breadstuffs in this market were dull and quiet until Monday, when there was a decided break, due to an unexpected increase of 2,250,000 bushels in the visible supply, and this despite better cables and bad weather in Europe. Higher ocean freights checked spot demand. The August squeeze in cotton produced an interesting market, the distinctive feature being the receipt of some 4000 bales from Liverpool to supply the "shorts," with more coming. Prices still inclined higher. Sugars are still in a strong position, the receipt of recent pur-

chases exerting little influence. The receipt of three large cargoes of rice from Japan in this port is noted as a novel occurrence. The coal trade is active.

The aggregate exchanges of thirty-eight clearing houses, for the week ending August 11, show an increase of 6.6 per cent. compared with the corresponding period last year; outside of New York the gain was 7.7 per cent. and the improvement was well distributed, although more noticeable in the Northwest—in Duluth, Detroit, Omaha, Denver and Milwaukee. Pittsburgh is 15.4 per cent. and the seaboard cities gain moderately, except Baltimore, which loses 0.6 per cent. St. Paul and Minneapolis are both in arrears.

The weekly bank statement showed a further decrease of \$2,643,550 in the surplus of reserve, which is thus reduced to \$24,106,825. The excess of reserve at the corresponding time in 1887 was only \$4,733,925, and in 1886 \$7,212,225, so that the banks are able to meet the demands which will be made upon them by the South and West to move the crops, and which already begins to be felt. Specie showed a decrease of \$1,734,600. In loans there was an expansion of \$4,087,500. In deposits there was an increase of \$2,198,600. The supply of commercial paper is fair and the demand good. The gross earnings of 39 railroads or systems for the first week in August give an average gain over the corresponding week of 1887 of 5.84 %.

Sterling is heavy and inactive, with posted rates at \$4.85½ @ \$4.88. The Bank of England rate was advanced to 3 %. Anticipating this step, the London *Economist* of the 4th inst., after referring to recent heavy shipments of gold to South America, spoke of the threatened deficiency of the wheat crop in Europe and the consequent necessity of buying more grain in the United States and paying a higher price.

The exports of specie from this port during the week amounted to \$455,300, making a total of \$26,000,000 since January 1, against \$11,612,000 for the same time in 1887; imports nominal. The imports of merchandise at this port during the week were valued at \$7,249,700, of which nearly \$3,000,000 represents dry goods. Since January 1 the total is \$291,898,315, as compared with \$291,752,513 for the corresponding period in 1887 and \$267,315,671 in 1886. The exports for the week were valued at \$4,850,000.

Coal Market.

The Anthracite Coal market continues strong and active, so far as concerns deliveries on former orders, but there is no considerable business doing at the last advance. The tendency of prices is in the direction of a higher range, a subject which is now under consideration, and it is intimated that an advance of 25¢ per ton September 1 is not improbable, simultaneously with an advance in railroad tolls. In official quarters the flourishing condition of the Anthracite trade is spoken of without reserve. Vice-President Holden, of the Delaware, Lackawanna and Western Railroad, is quoted as saying: "The condition of the Coal trade is marvelous, and the demand throughout the entire country is so great that mining is taxed to its utmost. The daily output averages between 130,000 and 140,000 tons, so that, computing 27 working days for August, 3,780,000 tons will be taken from the mines." The actual figures just at hand show that while the production is of steadily increasing volume it is not unprecedented—as yet not quite equal to that of August four years ago. The total output for the week ended August 11 amounted to 831,615 tons, an increase of 76,000 tons compared with the previous week, and 102,000 tons compared with

the corresponding week in 1887. Since January 1 the aggregate is 21,158,567 tons, against 20,744,000 for the same time last year.

It is reported that at Long Branch, on Tuesday, the freight agents of Coal-carrying railway companies had a conference over a proposal to advance their freight rates from 10¢ to 20¢ per ton. There were differences of opinion as to details, but it was agreed that the increased rate was essential and will be put into effect.

Quotations are as follows: Wyoming Free Burning, f.o.b. at South Amboy and Weehawken, Broken or Grate, \$3.85; Egg, \$4.15; Stove and Chestnut, \$4.50; Reading Hard White Ash, Chestnut, \$4.40; Stove, \$4.50; Egg, \$4.25, and Broken, \$4.10. At a meeting of the agents in this city to-day (Wednesday) no change in prices was made.

In Bituminous Coal there is no change. Vessels are scarce.

The Anthracite Coal stock at the Port Richmond terminus of the Reading Railroad now exceeds 100,000 tons and comprises two piles, one of which is 65 feet high and contains 26,000 tons, entirely of Pea. The second pile consists of 15,000 tons of Chestnut. In January the yards were bare.

The Pennsylvania Railroad continues to lead all other roads as the greatest Coal carrier in the country, and already this year the quantity of Coal and Coke originating on the company's lines east of Pittsburgh and Erie exceeds the tonnage of the corresponding period of last year by over 1,000,000 tons. The total tonnage of Bituminous Coal and Coke and Anthracite for the 12 months ending December 31, 1887, was reported at over 14,250,000 tons, while in the first seven months of this year the total tonnage has reached over 9,000,000 tons.

Reading surveyors are engaged in the vicinity of Mahanoy plane locating a site for a great Coal depository. It is said that the management of the Reading Coal and Iron Company is about to begin a system of operations, the purpose of which is to increase the company's output, at the minimum of cost. One of these methods will be the connecting of the underground workings where two mines are located close together, so as to need the operation of but a single shaft and breaker. This plan has been worked with good success for some years past in other Coal fields.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from August 6 to August 11, inclusive, and from January 1 to August 11, inclusive, were as follows:

Iron and Steel.

	Aug. 6 to Aug. 11. Tons.	Jan. 1 to Aug. 11. Tons.

Metal Market.

Copper.—Spot Chili Bars in the London market came on Thursday of last week £81. 12/6, giving way in the meantime to £81. 5/ yesterday, while futures remained steady at £78 and good merchantable brands at £78. 10/, sales footing up over there 425 tons. The dealings here have meanwhile been restricted to purchases for syndicate account to the extent of 300,000 pounds spot and August at 16.7¢, the offerings continuing light. For near months 16.65¢ has been bid and for later months 16.50¢ without stirring up the least speculative interest. To-day London advanced with spot Chili Bars to £81. 10/, and with futures to £78. 5/, good merchantable brands declining meanwhile to £78. 7/6. Best Selected has remained steady at £76 in London. The domestic export of Ingot Copper during the fiscal year ended June 30 last has been 25,303,337 lb, against 19,580,023 lb the previous twelvemonth. As per Messrs. James Lewis & Son's, Liverpool, monthly circular of August 1, the visible supply in England and France was 80,616 tons Fine, against 75,169 July 1, 70,431 June 1 and 52,138 tons August 1, 1887; the deliveries were respectively 43,029 tons, 56,397 and 53,749 tons January 1 to August 1 in 1888, 1887 and 1886; the import from the United States into Liverpool and South Wales was respectively 16,530 tons Fine, against 6010 and 9236 tons.

Tin.—Our market has been unsettled by the continual fluctuations in London, where the struggle for mastery has continued, spot opening last Thursday at £92, advancing to £95, and receding to £92. 15/ yesterday, while futures opened at £92. 5/, and, after touching £93. 17/6, came £93. 5/ yesterday; sales 640 tons. To-day London improved with spot to £93. 10/ again, and with futures to £93. 17/6. Here the speculative fraternity have been most of the time about 1¢ apart, so that business came to a standstill at nominally 21¢, spot, and 20.80¢ November. The import of Tin into the United States during the fiscal year ended June 30 last has been 31,690,583 lb, against 29,645,511 lb the previous twelve months, while the re-export was 325,077 lb, against 121,805 lb. **Tin Plates.**—At first active, the market subsided into quietude in view of the erratic course of the Pig Tin market, and, while the main features remain unaltered, the general tone is for the moment one of expectation rather than of action, awaiting further developments. Liverpool has not swerved from 13/6 for Cokes. We quote at the close large lines on the spot: Siemens-Martin Steel, charcoal finish, \$4.85 @ \$5.25; Coke finish, \$4.75; Ternes, \$4.30 @ \$4.40; Bessemer Cokes, \$4.50 @ \$4.60, and Wasters \$4.20 @ \$4.25. The import of Tin Plates into the United States during the fiscal year ending June 30 last has been 634,944,601 lb, against 572,220,397 lb the previous twelvemonth, and the re-export respectively 931,667 and 1,067,299.

Lead.—The main operator has during the week continued his speculative purchases to the extent of 1000 tons Common Domestic at 4.30¢ @ 4.40¢, consumers meanwhile remaining apathetic. As the said gentleman has the local market well under control, however, it remains strong to-day at 4.40¢, while St. Louis is 4.25¢ and Chicago 4.30¢. In London Soft Spanish gave way from £13 to £12. 17/6, at which latter figure it cost 4.80¢, duty paid, to lay it down here. English Pig declined from £13. 5/ to £13. Next month some of our consumers will have to supply themselves. To-day 100 tons of November Lead sold at 4.37½¢ @ 4.35¢, the bulk at the latter figure.

Spelter.—Has been moderately active and firm at 4.62½¢ @ 4.65¢ for Common Domestic, and 5.30¢ Silesian, the latter advancing in London from £16. 7/8 to £17.

Antimony.—Was featureless at 9½¢ @ 9½¢, Hallett, and 13¢ @ 13½¢, Cookson, the former not varying from £39 in London.

New York Metal Exchange.

The following sales are reported:

THURSDAY, August 9.	
50,000 lb Copper, spot.....	16.70¢
200,000 lb Copper, August.....	16.70¢
FRIDAY, August 10.	
25,000 lb Copper, spot.....	16.70¢
10 tons Tin, September.....	21.40¢
MONDAY, August 13.	
16 tons Lead, August.....	4.37½¢
WEDNESDAY, August 15.	
50,000 lb Lake Copper, spot.....	16.70¢
80 tons Lead, November.....	4.35¢
16 tons Lead, November.....	4.37½¢

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, August 15, 1888.

There have been no new developments in the market for Chili Bar Copper. The transactions have averaged light, with but a small portion for the account of consumers, and prices have varied in a moderate degree only. Trading in the new-form contracts has continued large, however, and at a higher range of prices, owing to the general belief that there is less opportunity for "corner" tactics. There is less "outside" Copper offering on the market than for some time past, but stocks are still accumulating on the syndicates' hands.

Pig Tin has ruled very strong under manipulation by the "bull" party, although reacting at intervals when realizing sales were in order. The degree of success with which the "bull" party have carried their point thus far has attracted a considerable following, and there is more than a faint possibility that the leaders have made the most of the circumstance to dispose of a portion of their holdings. Consumers have not figured to any remarkable extent as buyers. Scotch Pig is 6d @ 1/ higher on most brands, Middlesboro' has improved 6d and a similar advance has been made on best brands West Coast Hematite. The manufactured Iron trade has been brisk, with about 5/ advance on common Staffordshire Bars. The Steel Rail market continues firm and business has been done at a slight advance. Blooms, Billets, Slabs and Rods are quiet, however, with values barely steady.

The situation in the Tin Plate market has undergone no particular change. Bessemer sorts are still in active demand, and prices for the same continue to harden. Other kinds meet with only moderate request, however, and barely hold their own in value. Sales have been made at about 3d. advance on last week's prices, in the instance of both Cokes and Charcoals.

The Scotch "warrant" market has weakened somewhat under the influence of pressure to sell, consequent upon the fact that four furnaces have been changed from Hematite to Ordinary Iron. Prices have hardened again, however, owing to renewed demand, attributed to an improved demand for makers' brands, Middlesboro'

and Hematite Pig. Scotch warrants touched 40/ to-day.

The manufacturers of Skelp Iron have formed a combination and advanced prices to 76/ per ton.

There has been more disposition among holders of Old Iron Rails to sell, and business is reported at prices below those generally quoted.

The Landore Siemens Steel Works closed very suddenly. The cause is unknown.

Scotch Pig.—There has been a good business in makers' Iron and prices have hardened.

No. 1 Dalmeilington, " ".....	41/6
No. 1 Eglinton, " ".....	40/

Steamer freights, Glasgow to New York. 6/; Liverpool to New York. 7/6.

Cleveland Pig.—Prices have advanced and the market is strong with a good business. No. 1 Middlesboro', G.M.B., 35/9; No. 3 do., 33/3.

Bessemer Pig.—Transactions have been liberal and the market is very firm. West Coast brands, mixed numbers, 44/, f.o.b. shipping point.

Spiegeleisen.—There is still a good demand, and prices remain firm. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—The market very steady and demand fairly active. Standard sections quoted at £3. 18/3, f.o.b. at N. W. England shipping point. Middlesboro' district 2/6 less.

Steel Blooms.—Quiet market and no material change in prices. We quote at £3. 12/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—Values a shade lower business fair at the decline. Bessemer, 2½ x 2½ inch, £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—The demand moderate, but prices steady. Bessemer, £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—Prices about steady and business moderate. Mild Steel No. 6 quoted at £5. 16/ and No. 5 at £5. 14/, f.o.b. at N. W. England shipping point.

Old Rails.—More pressure to sell and values are somewhat unsettled. Tees quoted at £2. 17/6, and Double Heads £2. 18/9, c.i.f., New York.

Scrap Iron.—Supplies firmly held but demand slow. Heavy Wrought quoted at £2. 7/6 @ £2. 10/, f.o.b.

Crop Ends.—Holders are firm but sales are moderate. Bessemer quoted £2. 5/ @ £2. 7/6, f.o.b.

Tin Plate.—There has been a good business and the market is strong. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	14/9 @ 15/3
IC Bessemer steel, Coke finish.....	13/3 @ 13/6
IC Siemens " ".....	13/6 @ 13/9
IC Coke, B. V. grade.....	13/ @ 13/3
Charcoal Terns, Dean grade.....	13/ @ 13/3

Manufactured Iron.—The general market strong and fairly active. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars....	£ s. d. @ 7 10 0
" Common " ".....	@ 5 0 0
" Blk Sheet, singles ".....	@ 6 15 0
Welsh Bars (f.o.b. Wales)....	4 12 6 @ 4 15 0

Tin.—The market very firm. Straits quoted at £93, spot, and £93. 15/ @ £93. 17/6 for three months' futures.

Copper.—Market quiet and unchanged. Chili Bars, £81 @ £81. 5/, spot, and £78 @ £78. 5/ three months' futures. Best Selected, £75. 5/ @ £75. 10/.

Lead.—Weak market, with business slow. Soft Spanish, £12. 10/ @ £12. 15/.

Spelter.—The market stronger and more active. Silesian, ordinary, £17.

Cleveland.

CLEVELAND, August 18, 1888.

Iron Ore.—The total shipments, by both rail and water, to date, slightly exceed 2,150,000 tons, the best authorities now placing the year's output at that figure. Sales for the past week have been confined to scattering, and in some cases special, lots at figures scarcely indicative of the true condition of the market. Prices for all grades of Ore are firmer because of the slowly advancing lake freights. The Chapin Mine has made additional sales of Ore at \$5, and will ship altogether over 200,000 tons of Ore this season. The following are f.o.b. cars Cleveland quotations:

No. 1 Specular and Magnetic Bessemer Ore.....	\$5.50 @ \$6.00
No. 1 Specular and Magnetic Non-Bessemer Ore.....	4.75 @ 5.00
Red Hematite Bessemer Ore.....	4.50 @ 5.00
Red Hematite Non-Bessemer Ore.....	3.50 @ 3.75
Menominee Range Bessemer Ore.....	4.75 @ 5.10
Menominee Range Non-Bessemer Ore.....	3.50 @ 3.75
Gogebio Range Bessemer Ore.....	4.75 @ 5.15

Pig Iron.—Steady sales are doing much to clear the market up closely to production. Several instances are reported this week of orders for round lots having been declined, the seller not having the iron on hand. Dealers report a firmer feeling and look upon the situation very hopefully. It is believed that quotations cannot fail to advance within the next ten days. Mill Iron is in especial good demand at present, and Foundry Iron, both hard and soft, is selling freely. The sale of 2000 tons of No. 1 Foundry at \$16, f.o.b. cars, delivered, is reported.

Scrap Iron.—The market is lifeless, Old American Rails being offered at \$20 and Old Wheels at \$18.50.

Nails.—Steel Wire Nails at \$2.50 per keg seem to have usurped the market, very little being done in Steel Nails at \$2, or Iron at \$1.90, beyond a few stock sales.

Sheets.—No. 24 is now quoted at \$2.75. Special shapes are in excellent demand.

Manufactured Iron.—Common Bar is selling from store at 1.65¢, with only a moderate inquiry.

A fire in Pittsburgh, yesterday morning, destroyed the machinery in mill No. 2 of the French Steel Spring Works, on Liberty and Twenty-first streets. The loss will not exceed \$25,000, and is covered by insurance. The fire started from an overheated smokestack.

The New Ore Discovery Near Marquette.—Since the opening of the Negau-nee, Buffalo, South Buffalo, Sam Mitchell and other good mines in the so-called "East range" two years ago some desultory exploring has been done further to the east. Among those who did more or less work at Morgan, half way between Marquette and Lake Superior, was Wm. P. Healy, of Marquette. He secured an option on the N. W. quarter of the N. E. quarter of section 6, township 47, range 25, north, from Pittsburgh & Lake Superior Iron Company, which owns some 30,000 acres of land in the mineral belt of the country. He gave up the option after spending a great deal of time and money, and work was continued by the owners of the property where Mr Healy left off. A diamond drill was put at work, and 45 feet of clean ore Bessemer quality was passed through,

and the drill was still in ore. Ralph Bagley, G. I. Whitney, J. N. Lippencott, C. Yeager and the heirs of John Deens are among the Pittsburgh parties interested in the discovery.

Zapon Enamel.

A lacquer or enamel known by the name of "Zapon" is being put upon the market by the Frederick Crane Chemical Company, Short Hills, N. J. In referring to its merits, the manufacturers compare it with the ordinary lacquer generally used on metal work, and point out in what particulars it is superior to the common article. In the first place, it is said that when scratched it does not show a white mark, but leaves a clean cut, the same as if a surface of metal were scratched. It is also said to be extremely hard, besides remaining unaltered by dampness, moderate heat or vapors. The perfection of the work, as with ordinary lacquers, is largely dependent upon the care exercised in applying it, and it will, therefore, be of interest to present the following description of the method of its application furnished by the manufacturers:

The article to be coated is made perfectly free from grease, dirt, lint and moisture, and should be at a normal temperature, for, if cold, the zapon will thicken more readily in the hollows, and some grades would show chalky white streaks; also, more material would be used, and, on account of the thickness above mentioned, it would be more difficult to produce a perfect coating. On the other hand, if the metal is too warm, the zapon will set too quickly, and will not have sufficient time to spread or flatten itself out; further, a high degree of heat would be apt to turn the collections in the hollows and at the lower edge of the article a light yellow or brownish tinge. It is recommended, therefore, that the metal, as well as the zapon itself, should be at the temperature of an ordinary working-room, though, when skill is attained, the temperature may be run up to 100° or more, where it is necessary to push work through rapidly.

The manufacturers have patented a combined drip rack and drying closet, which they send out complete, with the exception of the steam coils for heating, which are generally put in by the machinist of the factory to which the rack goes. For convenience of shipping the rack is made in sections, and is shipped knocked down. It consists of the following parts: Four sections, which in pairs form the sides of the rack; the fifth section is placed over rests upon the sides, forming the top; two swinging doors close the rear end, and a sliding door divides the drip rack from the drying closet; this sliding door is furnished with ropes and sash rollers, and works like a sash in guides. Two strips placed about a foot from the floor on the inside of either side serve to hold the two sections together; two other strips, placed in the same manner about 6 inches below the top, serve the same purpose there. This second pair of strips carry a series of rollers placed about 4 inches apart on the upper side of the strip. A series of blocks about 1 inch square and 8 inches long rest on the rollers, and passing from the center of the block on one side across the rack to the center of the block opposite is an iron rod, and so with the other pairs of blocks in the same way through the whole length of rack. These rods are for hanging the work upon after it has been dipped.

A wooden case or tank, lined with tin, and having a deeply flanged cover, is placed at the front end of the rack; this tank is usually 8 inches to 1 foot in width, 2 feet deep, and as long as the rack is

wide, and rests upon a shelf placed about 1 foot from the floor and reaching from side to side of the rack. This brings the top of the tank 8 feet from the floor, which is a comfortable working height. Into the tank is poured enough zapon to cover the average of the articles intended to be dipped, and usually this makes it about one-half full, it being made so deep to prevent unnecessary evaporation by the passing of drafts or currents of air across the surface of the liquid. The article to be zaponned being hung upon a suitable hook and in a way which experience alone can dictate, is dipped into the liquid and immediately hung upon one of the iron rods above described, which has been placed immediately over the tank. The second article is dipped and hung up in the same manner, and so on until the rod is full; care being taken not to have the pieces so close together that they will strike each other or the sides of the rack, and be marred thereby. When the rod is full the sliding door is lowered sufficiently to allow the rod to pass beyond it with its burden, the pieces having by this time ceased dripping, the rollers above described reducing the friction as the rod is pushed back. The sliding door is raised to its position or goes up by the aid of weights. The second rod is placed in position over the tank, other articles are dipped and hung as before, and this rod, when full, is pushed back like its fellow, and so the process proceeds until the closet is full, when the rear doors may be opened and the rod first put in may be removed if the articles hanging upon it are sufficiently dry, as will usually be the case.

If a boy is employed to remove the articles, the man or boy doing the dipping may proceed with his work without intermission. If work is being pushed rapidly the zapon is not allowed sufficient time to take up its own drip—that is, the little collection at the bottom of the article, where the last two or three drops gather, and to overcome this the finger may be applied to the drop before it has become set or stiffened, and in this way most of it will be removed. As the zapon is used it will evaporate somewhat, especially from the drops falling from the articles freshly dipped, and to prevent its becoming too thick a special diluting liquid is added from time to time, as experience dictates, and thoroughly stirred in. Where large tanks are used it is found necessary to do this only once or twice a day—say at noon when work stops, and at night. The time thus allowed for the liquid to remain undisturbed being an advantage. If care is used not to allow dirt, rouge, lint or other foreign matter to get into the zapon, and if the tank is tightly covered whenever not in use, the material, it is said, may remain in it for weeks without detriment, but if through carelessness it becomes soiled, simply standing it aside for a few days or weeks and using a fresh lot enables the foreign matter to settle, when the zapon may be decanted, and will be found as good as at first. Rouge, however, or other coloring matter cannot thus be removed.

There are now being constructed in the Canadian Pacific Railway shops, at Hochelaga, 40 locomotives which will have an average weight each, with tender, of 157 tons. The cylinders are 18 inches in diameter and have a 22-inch stroke. Each engine will have six driving wheels, and the steam pressure will be 180 pounds. They are for use in the Rocky Mountain section of the Canadian Pacific Railway.

The managers of the Penn Rolling Mill, of Lancaster, Pa., have posted a notice that the mill will suspend indefinitely owing to dullness in the iron trade.

Hardware.

The demand for Hardware shows a considerable improvement, and stocks of goods in manufacturers' hands are becoming light, so that it is sometimes difficult to get prompt shipments. While there is no considerable advance, nor in fact any changes in prices worthy of mention, a firmer feeling is steadily gaining among manufacturers, owing largely to the firmer tone of the metal market.

Cut Nails.

There is more inquiry. Sellers are firmer, and do not give way as easily as they have hitherto done. There is still some cutting, but the tone is better, with \$1.85 a bottom figure for large purchases of standard Nails. We quote \$1.95 to \$2 from store for Iron and Steel Nails. The last statistics of the Atlantic States Nail Association show an unusually light product in July, the sales, too, being small in volume.

It is a matter of comment in the Northwestern Hardware trade that Iron Nails now seem to have no standing whatever. For a long time after the introduction of the Steel Nail it was found necessary by jobbers to carry stocks of both kinds of Cut Nails to meet the views of customers in different localities. The situation was then further complicated by the introduction of the Wire Nail, and the rapidly increasing trade in it. Partly through the breaking down of prejudice against the Steel Nail on the part of consumers, and partly through the efforts of jobbers to rid themselves of an undesirable addition to their stock, the consumption of Iron Nails has been so heavily curtailed in the section referred to that when Nails are now called for it is taken for granted that Steel nails are meant. Iron Nails must be asked for specially if they are desired, and it is then a matter of some difficulty to get them, as many jobbers absolutely refuse to keep a stock of them on hand. Steel Cut Nails and Wire Nails must both be carried in stock in full assortment, and dealers believe the Nail trade is sufficiently cared for in that way. The Wire Nail is still gaining on the Cut Nail to some extent, the rural trade of the Northwest being inclined to prefer Wire Nails, the proportion in extreme cases running up to 60 per cent. of the total Nail sales.

Wire Nails.

The market continues quiet, and values are unchanged, with small lots of base sizes selling from store at \$2.45 to \$2.60. The proposed combination, referred to in a recent issue of *The Iron Age*, has met with opposition from one leading mill, which declined to enter it. For the present the plan is therefore in abeyance.

The Cordage market continues very firm, and it now looks as if the manufacturers would soon have complete control of the market. Prices remain steady at the figures given in our last issue, but buyers seem to be unwilling to make orders at the sharp advance there noted. The amount of actual transactions has, therefore, been small. Some of the jobbers, both in the East and West, are offering Cordage at concessions from the manufacturers' prices.

We have received from A. Roesler & Co., Warsaw, Ill., a circular announcing a reduction in the price of their Black Luster Stove-Polish Paste. They now offer it in cans for dealers' use at 15 cents per pound, or 75 cents per can, and in boxes for family use 60 cents per dozen, or \$7.50 per gross. We are informed that the trade in this article is rapidly increasing, and that, having increased their facilities for manufacturing, they are enabled to offer the polish at reduced prices.

Hibbard, Spencer, Bartlett & Co., Chicago, have issued a circular of Campaign Goods, adorned with cuts with the gorgeous coloring befitting such a line. Among the articles shown are a great variety of Lamps, Torches and Lights; Hats, Caps, Helmets; Enameled Cloth Capes, Coats, &c.; Shirts and Suits of Flannel, Duck and Oil-Cloth, patent Collapsible Transparencies; various instruments of vocal torture under the heading of "Noise in any shape"; Flags and Banners of various kinds; Grand Army Drill Equipments, and ending with three pages of Fireworks. Hibbard, Spencer, Bartlett & Co. are making great preparations for this trade, in which they claim to be headquarters, and have a line of goods which will do much to prevent this "campaign of intellect" from being too monotonous.

The Witte Hardware Company, St. Louis, have issued a large and handsome catalogue of 865 pages, showing the goods they keep in stock, with the manufacturers' price lists, and fully illustrated. The goods included embrace a full line of the goods usually found in a hardware store, arranged in departments as follows: Mechanics' Tools and Farming Tools and Implements; Builders' Hardware; General Hardware; House Furnishing Goods; Stamped, Granite and Hollow Ware; Guns, Pistols, Ammunition, Sporting Goods, Skates, Ice Tools, &c.; Cutlery. The book is substantially and handsomely bound, and will prove very serviceable to the trade.

Mast, Foos & Co., Springfield, Ohio, have rearranged and made some novel additions to their exhibit at the Centennial Exposition at Cincinnati, chief among which is an exact duplicate of their Iron Turbine Wind Engine, which, by means of a current of air supplied some distance therefrom, is made to move and operate in a most realistic manner, the cause of its movement not being readily apparent, proving a constant source of wonder to the visitors, while Force Pumps and full-sized Wind Engines are also made to operate by means of concealed gearing located beneath the platform upon which they stand. Highly finished specimens of the Buckeye Senior and Junior Lawn Mowers, Wrought Iron Fencing, Cresting, &c., complete the exhibit.

The Udell Woodenware Company, A. A. Barnes, proprietor, Indianapolis, Ind., exhibit a very attractive and comprehensive display of their productions of Woodenware, chief among which are the Udell Step and Extension Ladders, Blacking Cases, Folding Tables, Wall Cabinets, Commodes, Hat and Coat Racks, Rope Reels and Broom Stands.

The Bromwell Brush and Wire Company, Cincinnati, exhibit an interesting collection of their productions, consisting of Brushes of every description, Turkey and Feather Dusters, Bird Cages, Fly Traps, Wire Cloth Sieves, Corn Poppers, Barbed Wire, Wire Rope, &c.

The Gooch Freezer Company have on exhibition a very large assortment of their well-known Peerless and Giant Ice-Cream Freezers, ranging in sizes from 3 quarts up to 42 quarts each.

Schenck's Adjustable Fire Back Company, of Chicago, report a rushing business in Bolt and Screw Cases. Last week they shipped six large cases and six flower stands to Australia via Boston, and on the same day sent three cases to Portland, Ore. Other shipments embrace two orders of three cases each to North Carolina and an order of something less than a carload to the Pacific Coast. On cases for Hardware jobbers' use as a sample in their stores the company are offering a special discount.

The Fred. J. Meyers Mfg. Company, Covington, Ky., inform us of the death of Mr. W. R. Spofford, who died on the 5th inst. at Pine Bluff, Ark., while traveling on their business. He was an exemplary young man, and his death will be regretted by all who knew him.

The advertisement of Woodruff, Miller & Co.'s Mount Carmel Ox Shoes on page 75 is worthy the attention of all dealers in this line of goods. Their Steel Toe Calk Ox Shoes have met a largely increased demand during the past 10 years among all classes of shoers, and the manufacturers inform us that their claims that they are better adapted to general shoeing and will outwear any other Shoe are supported by hundreds of testimonials from shoers in every part of the country. Besides the patterns shown in the advertisement, they make to order any size or pattern that may be desired. The same Shoes can be furnished at a lower price if the Toe Calks are not converted into steel. The manufacturers would be glad to enter into correspondence with any of the trade who are not handling their goods.

Jacob F. Knorr, an old and well-known resident of Orange, died suddenly in the Hoboken ferry-house on the 9th inst., while on his way to his office in New York. Mr. Knorr was born in Philadelphia in 1808, and lived there until the war broke out, he having amassed a large fortune in the Hardware business. As most of his trade was in the South, the war brought reverses to him and he removed to New York, where he founded a company, of which he was still president at the time of his death. His office was at No. 49 Murray street.

The Morrill Saw-Set Company have been incorporated with a capital of \$10,000.

In an advertisement on page 49 will be found the decision of Judge Andrews of the Supreme Court in this city of application for the counter injunctions between Baeder, Adamson & Co. and the Baeder Flint Paper Company, involving the use of the word "Baeder" as a trade-mark. The decision was in favor of the latter company in both cases.

J. Jacob Shannon & Co., 1744 Market street, Philadelphia, have issued a very handsome catalogue and price list of Builders' Hardware exclusively. This book, of 292 pages, which is very finely printed and well bound in cloth, will, we are informed, be placed in the hands of nearly every builder in the United States, as well as some in foreign countries. We have seldom seen a book better adapted to its purpose or more creditable to all concerned in its preparation.

The Taylor & Boggis Foundry Co., of Cleveland, Ohio, have bought the Kidder Slide Door Hanger patent and patterns and good will of the business. This will involve no change in the manufacture of the goods, which have all been made by them for the past seven years. They promise to keep constantly on hand a large stock of both sizes, that orders may be promptly filled, and to fully maintain the quality of the goods.

Among our Special Notices will be found the announcement of Haydock & Bissell of a special trade sale on Wednesday and Thursday, August 29 and 30, of miscellaneous Hardware, including 500 cases Philadelphia Screw Company's Flat Head Iron and Brass Screws, to be sold by the case only.

The copartnership existing between H. N. Henderson and L. A. Harker, of Columbus, Ohio, under the firm name of the Henderson & Harker Mfg. Company, has been terminated, and the business

transferred to a stock company under the title of the Henderson, Harker & Hayden Mfg. Company, of which Mr. H. N. Henderson is secretary and L. A. Harker superintendent, Mr. Henderson being authorized to settle all copartnership matters. The new concern will continue the manufacture of the Columbus O. K. Stove Pipe Elbows, Get-at-able Rain-Water Cut-Offs, and "H. & H." Gas Soldering Furnaces, together with a variety of other articles formerly made by the old concern.

The Union Indurated Fibre Company have been successful in the introduction of their Indurated Fibre Pipe for electrical work. We are informed that the Bell Telephone Company, of Philadelphia, are laying some 7 miles of this Pipe, and we understand also that large contracts are in negotiation with a leading Eastern railroad for this Pipe for underground systems of telegraph. The Union Indurated Fibre Company are furthermore introducing their ware for battery jars, and mention a number of orders for this purpose that have been awarded them.

Overbuying in the Retail Trade.

In one of our exchanges, representing an important line of trade, we find some very pertinent remarks, which seem to apply with equal force to other lines of retail trade. The writer referred to, in searching out the cause for so many failures in the dry goods trade, comes to the conclusion that it results from buying more goods than can be profitably disposed of. In former times merchants with small capital, as a rule, prospered and built up a large business. They very rarely allowed themselves to acquire a larger stock of goods than they could conveniently handle, and keeping their business well under control were in a position to see their profits in a more tangible form than the stock of goods in store. Nowadays, says our exchange, when a merchant is in trouble, and has made no outside speculations, he will be found almost invariably with a large stock of goods on hand. The same has been slow in sale, bills have matured, and as all his money is invested in the stock he is compelled to make an assignment. Overbuying is the rock on which he splits.

The moment the retail merchant gets to doing a trade of forty, fifty or one hundred thousand dollars a year he wants to buy direct from the manufacturer or the manufacturer's agent in quantity, instead of purchasing from the jobber in smaller packages from time to time as the needs of his trade require. Suppose he does buy from the manufacturer or his agent and saves 10 or even 15 per cent., the latter as a rule will force him to buy five times the amount of goods that the jobber can usually sell him. He takes the goods home and places them on his shelves, and then finds out that he has five pieces of an article where one would have been sufficient for the demands of his trade. This is probably true of almost his entire stock, and very likely in high cost goods. The consequence of this is he has accumulated a large stock which he cannot sell, and his capital is not only wrapped up in the same, but he also owes for a good part of it besides. On the other hand, probably he has a bright young merchant of his town as a competitor, who goes to market often, and buys of the jobbers one piece of a color, who probably pays 10 or even 12½ per cent. more than the former does. The latter takes his goods home and sells them, and has his capital in the drawer, but the other merchant has all his capital wrapped up in old stock on his shelves, and is worried to death to meet maturing bills to pay for goods which he cannot sell. This has been the cause of more failures in the retail trade than probably anything else.

Arrangement of Stores.

The diagrams which we give below represent the arrangement of the store of Moore, Moore & Handley, Birmingham, Ala., wholesale and retail dealers in Hardware, Machinery, Railroad and Builders' Supplies, who have recently moved into their present quarters, which for convenience and completeness of arrangement are highly spoken of. There are two trunk railroads at one end of the store, a street at the other, while there is an alley on one side and a light court on the other, extending about half the way back. The ends of the building from bottom to top are described as consisting of doors and windows, so that altogether the house is as

bars 1 inch iron. In its nine tiers there are 144 compartments. The stock ranges from ½ x ½ and ¾ round to 1 x 7 inches, 2½ round and 3 square.

The Axle and Skein rack, being 8½ feet high, also in two tiers, has 81 bins, 56 on the Axle and 25 on the Skein side. Machine Bolts are stacked in the southeast corner of the room in cross layers just as they come. This arrangement has been found much more convenient than bins. In the Horseshoe and Nail department, Fig. 258, there are two tiers of 17 bins each. The Horseshoe tier is on a level with a base shelf 24 inches from the floor and 21 inches deep, upon which a 240-pound Boston Grocer's Scale runs on an iron track, as shown in cut. The Nail

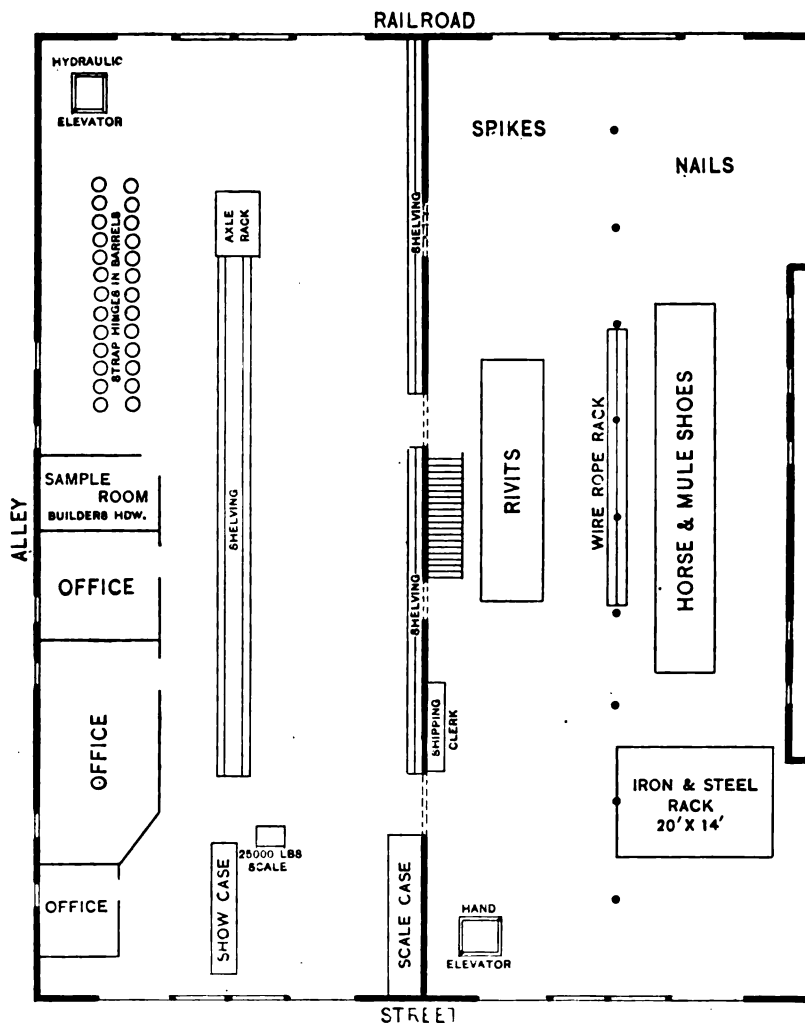

Fig. 258.—Moore, Moore & Handley's Store.—First Floor.

well lighted as possible. We give diagrams of the first and second floors, which show the principal features of arrangement.

The fixtures and furniture are of the most approved design, and are well finished and attractive in appearance. The shelving is adapted to the stock and equipped with Morley Brothers' Railroad Ladders. The goods are received at the railroad end of the house, and in case of need raised to the second and third floors by means of a hydraulic elevator. Shipments are made mostly from the street front, where the hand elevator does service between the floors.

It will be seen that the extremes of the heaviest goods in the house and the shelf goods meet on the first floor. The Iron and Steel rack, which, being secured to both floor and ceiling, strengthens the building materially as well as stores the goods in the smallest possible superficial compass, measures 20 x 14 feet. Its estimated carrying capacity is 800,000 pounds. Its uprights are 4 x 6 timbers and cross-

tier is 16 inches above, convenient to the scoop. The Nails are raked into this from the bins, and, having been weighed, are poured into paper sacks, so that they do not need to be handled at all. Crosscut Saws are kept in a rack of nine compartments, 8 feet high, and Shot in a three-tier rack of 18 compartments. All the shelving is movable, besides being adapted to every kind of stock.

The second floor is given up largely to Shovels, Picks, Spades and knocked-down Barrows, and of goods of this character a very large stock is carried. The Shovel, Spade and Pick rack is 6 feet high and is built in two tiers. The Belting and Packing racks are merely a succession of single bars of round iron as axes for the rolls to turn on. The Tackle rack is two rows of bars, six high, reaching to the ceiling. On the third floor is the Spoke rack, which also has two tiers and contains 22 bins.

The excellent display of samples is a notable feature of this establishment. The north wall of the second floor sample

room, 9 feet high, is covered with a great variety of samples from a Circular Saw down, and, being some 15° out of perpendicular, shows them to the best advantage. Across the middle of the room runs a show case, 6 x 29 feet, supporting a two-sided baize-covered frame covered with small shelf goods. The case, which is rather a succession of small cases on either side of the frame, is just deep enough to hold small fancy articles that need to be protected from the dust. Parallel with and 3 feet from the wall is a set of Shelves for Scales. This shelving is 29 feet long. On the lower shelf, 6 inches from the floor, Platform Scales are carried. On the next, which is the height of the pillar of a 1200-pound Scale, Union and Grocers' Scales are accommodated, and on the next,

until on a perpendicular they stand edge to edge out of the way, and leaving the two sides of the shaft absolutely unobstructed from floor to floor. This latter point is referred to as a considerable advantage over the wiring and doors which usually do the same service. The economy of the contrivance is also alluded to, as the latter method for two elevators would cost, it is estimated, some \$300, whereas the contrivance in use is referred to as costing less than \$10.

When Trade is Dull.

The duty of the merchant or manufacturer at such times, says a recent issue of the *Dry Goods Chronicle*, is to create business by offering new and attractive styles, by seeking new customers and pushing

present is a good opportunity to try the experiment. Business is dull in midsummer and you have goods to sell. Let the public know it through the columns of an influential journal, and your wares will soon find a market.

Signal Service Reports.

In one of our exchanges we find the following, which will be of interest to all those in the retail trade who are on the alert for opportunities to display business enterprise:

In small towns where no signal service stations are located the United States Government will furnish daily weather reports to the first responsible party who will apply, and agree to erect a staff and display the signals. The staff need not be a very expensive affair, and the flags cost from \$6 to \$12 according to the quantity. In places of any size the Government furnishes the service positively gratis, and where it is impracticable for the United States to bear the expense only the bare cost of the telegrams at 1 cent per word is made. As will be plainly seen, it is a

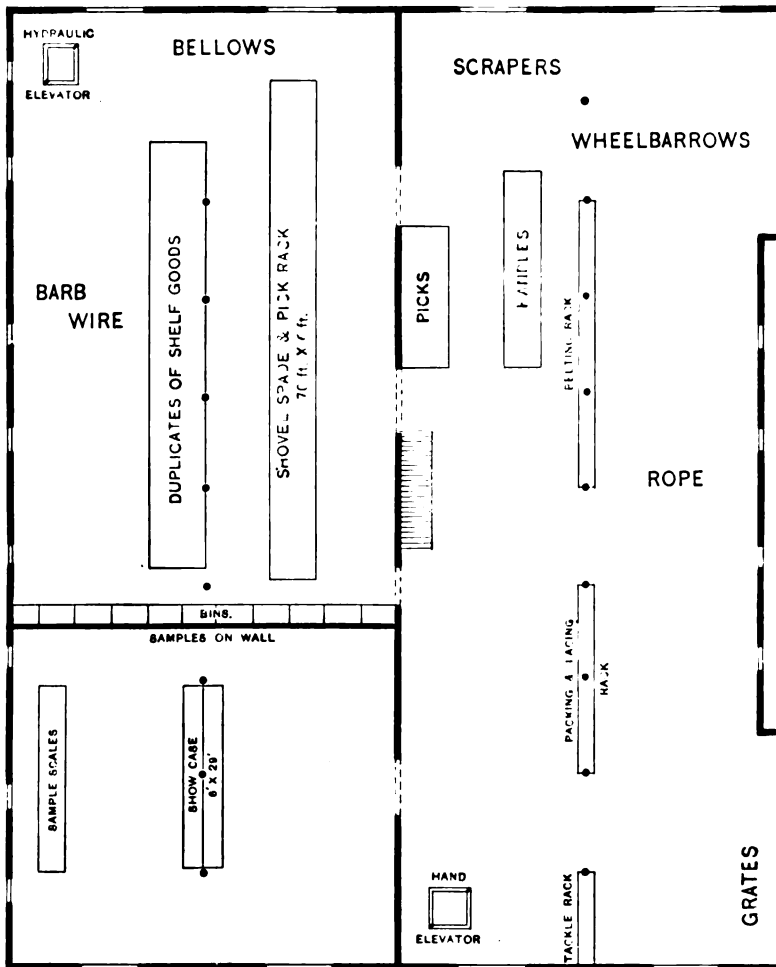

Fig. 259.—Moore, Moore & Handley's Store.—Second Floor.

which is the height of the top of the scoop of a Union Scale, are Trip Scales. On the other side of the sample room are six counters running at right angles with the central sample cases, which, however, are not shown in the diagram.

In the Scale case on the first floor 20 styles of Fairbanks' Platform or Counter Scales are displayed, the small styles being arranged on two shelves at a convenient height. Immediately in front of it is arranged a line of sample Macneale & Urban Safes, for whom they are agents. They are also agents for Bates's Hand Elevator, one of which they have in use, as shown in the diagram. The hydraulic elevator is of the Hale make. The method adopted for protecting the well holes is alluded to as especially satisfactory. The device is the result of the ingenuity of one of their employees. Each opening is merely fenced to the height of 3 feet 6 inches, with strips of dressed pine. On the gate sides the strips are loose at one end where a slot receives them as they descend, and being merely bolted to a cross piece in the middle, approach each other as they ascend

beyond usual neighborhood limits. He should not sit down and wait for trade to come to him, but seek it on every side and through the use of every lawful instrumentality. When trade is dull a more active exertion must be made to secure it than when the business is brisk. When times are flush and money is plenty it requires but little effort to sell goods. There is not so much need of advertising at such times. The test of business ability is shown in periods of depression, when nerve, pluck and energy win the day. The bold, aggressive merchant then comes to the front, and, while the great majority of the dealers are timid and hesitating, he uses the columns of the newspapers, and to great advantage. By this policy he turns the retreat of others into a victory for himself; he attracts public notice and draws trade from every quarter. New advertisements attract far more attention in a stagnant market than when trade is at full tide. They indicate life and spirit in the midst of depression. They catch the public eye and win a new support. Shrewd merchants always advertise most in such periods. The

Fig. 260.—Horseshoe and Nail Counter.]

splendid advertisement; not only does it attract almost constant attention to your place of business, but you may have the signal code printed on your business cards for free distribution among your customers, and you will get much free advertising in the newspapers in return for the use of your dispatches. The cost is comparatively light, and it takes but little time to attend to the signals. Communications in reference to the display of these signals should be addressed to A. W. Greely, Chief Signal Officer, Washington, D. C., and the flags may be obtained of George B. Carpenter & Co., 202-208 South Water street, Chicago.

In their advertisement on page 81 it will be seen that Sidney Shepard & Co., Buffalo, N. Y., and C. Sidney Shepard & Co., Chicago, Ill., illustrate their Buffalo Dampers and Buffalo Damper Clips. These goods are alluded to as having black enameled wood handles and as requiring only one hole in the pipe. Their simplicity and excellence are also referred to.

A dispatch from Toledo, Ohio, under date of the 8th inst., reads as follows: "Not since natural gas was turned on in this city by the two gas companies practically under Standard control have the people been satisfied with the prices charged, especially to manufacturers. For a long time a movement has been quietly under way looking to the organization of a citizens' independent line. That movement has been very successful, over 150 prominent citizens having subscribed. The company will be incorporated to-morrow, and will be known as the Citizens' Natural

Gas and Trust Company. The capital stock has been fixed at \$100,000, and is nearly all taken."

Recent Legal Decisions.

TELEGRAPH COMPANY—MESSAGE NOT SATISFACTORY.

L. received a telegram from A. giving him a quotation of sheep as "Five six," and as he thought that a strange price he went to the operator and requested him to ask A. whether the quotation was "five six" or "five sixty," and then the operator, in due time, said to him that he had asked, and that the message "Five six" was correct. Then L. sold the sheep at \$6 each by the hundred, after having given A. an order to buy and ship the number he sold at \$5.06. There was no payment made for the repetition, and no demand for payment was made. L. had account for messages with the company which was paid at stated times, but no charge for repeating this message was made in the account. L. demanded his loss of 54 cents on each animal, but the company refused to pay on these grounds: 1. That no payment was made for repeating the message. 2. That the message was not definite enough to show the operator its importance. 3. That as L. had sold the sheep for a greater price than he had paid for them he had suffered no loss. L. then sued and recovered his claim, and the company carried the case—*Western Union Telegraph Company vs. Landis*—to the Supreme Court of Pennsylvania, where the judgment was affirmed. Judge Paxson, in the opinion, said: "1. That no payment was made for repeating the message is not important; had there been a demand and a refusal to pay, there would have been more force in the point; besides L. had a current account for messages with the company in which a charge for the repetition could have been made. 2. When a message is not delivered and suit is brought for damages, it may be shown that the telegram was not intelligible to the operator; but here there was a delivery, and besides it is evident that the alleged uncertain term was a quotation for sheep, many of which the operator took and sent daily. 3. L. is entitled to recover his actual loss in the transaction. He had to pay 'five seventy' instead of 'five six' for the sheep, or 54 cents more for each animal. That was his loss by reason of the negligence of the company. We have decided in another case that the difference between the cost to the sender of a telegram and the price the message gave is the proper measure of damages."

TELEGRAPH COMPANY—DELAY IN DELIVERING MESSAGE.

C. F. & W. cotton merchants, in North Carolina, had agreed to deliver 100 bales of cotton in December and 500 bales in the following February to certain persons in New York, and to provide for these deliveries, in November they telegraphed to T. & Co., their New York agents: "If market is firm and advancing, Narrator," and, after receiving a dispatch giving them the morning quotations in New York, they sent a second message containing simply the word "Narrator." This was one of the words in the code used by C. F. & W. and T. & Co. By reason of some delays in transmission, there being no direct line to New York, which required the use of "relay offices" and the messages reaching New York by different connections, though the second message was sent two hours and 30 minutes later, it reached T. & Co. three minutes earlier than the first message. There was nothing to indicate that the market would advance, and T. & Co. did not pay, as they thought the dispatch gave the indication,

there being nothing to indicate which message was first sent. It was shown that C. said to the operator when he delivered to him the first message, at 9.30 a. m., that he wished it to be sent at once, so that it would reach New York before the opening of the cotton market that day. Cotton rose soon after this, and C. F. & W. demanded that the company pay them, as their loss, the difference in the price at which they ordered the purchase of the 600 bales, and the subsequent market price, three days later, though they did not buy the cotton then, making a claim for money lost through a lost opportunity. They got a judgment, and the company carried the case—*Cannons vs. Western Union Telegraph Company*—to the Supreme Court of North Carolina, where the court decided in its favor. The chief justice, Smith, in the opinion, said: "1. The plaintiffs were negligent in sending the second message without any explanation as to the first sent, and their agents acted with indifference in not seeking further instructions about these inconsistent telegrams. But the message itself was not so written that its importance could be understood by the operator, and therefore nominal damages for the loss suffered from the delay in its transmission only can be recovered. 2. In this case, however, no damages can be recovered, because no actual loss has been suffered; the loss complained of was merely an opportunity to have made a bargain, which would have been profitable if the cotton had been sold at the advanced price three days later. Speculative losses cannot be recovered in this action."

Formation of Petroleum.—The theory is held by Professor Mendeleef, of Russia, that petroleum is produced by water, which penetrates the earth's crust and comes in contact with glowing carbides of metals, especially of iron. The water is decomposed into its constituent gases, the oxygen uniting with the iron, while the hydrogen takes up the carbon and ascends to a higher region, where part of it is condensed into mineral oil, and part remains as natural gas, to escape wherever and whenever it can find an outlet. If this assumption is correct, and a sufficient store of metallic carbides is contained in the earth's interior, petroleum may continue to be formed almost indefinitely, and yield a supply of fuel long after the coal has become exhausted. Professor Mendeleef supports his views by producing artificial petroleum in a manner similar to that by which he believes the natural product is made.

Capt. William R. Jones, general superintendent of the Edgar Thomson Steel Works, at Braddock, Pa., and the Homestead Steel Works, at Homestead, Pa., sailed for Europe on Saturday, the 11th inst. He expects to be gone three months, and will visit all the principal iron and steel works in England and on the Continent.

In July all previous records were again broken at the Sault Ste. Marie Canal. The number of vessels passing through the lock and the total tonnage were unprecedented, and the record for the season is far ahead of the same period last year, when the canal's business was away beyond anything previously known. It looks very much as if the "Soo" Canal, in seven months of 1888, would almost equal the tonnage record of the Suez Canal for the whole year. The growth of the commerce of Lake Superior is one of the wonders of this wonderful country. So says the *Cleveland Leader*. The Canadian government has asked for tenders for the construction of the Sault Ste. Marie Canal,

and for the enlargement of the St. Lawrence canals. The advertisement calls for the construction of a canal on the Canadian side of the river, through the Island of St. Mary. With the Canadian Sault Canal built, the St. Lawrence and Welland canals enlarged, and the use of the St. Clair flats guaranteed by treaty, Canadian vessels will have a right-of-way from Lake Superior to the ocean.

Coloring Porcelain.—In a paper on coloring porcelain in a high temperature furnace, Mr. H. Seger (*Chem. Zeit.*) states that the best porcelain hardly ever contains less than 0.5 per cent. of ferrous oxide, mostly 1.0 per cent. and more, and that the more highly colored Chinese and Japanese porcelains contain as much as 2.5 per cent. The yellow color of porcelain is due to the presence of this iron in the state of ferric oxide, the green color to its presence as ferrous oxide, the color actually produced depending on the nature of the burning. The gray color due to a mixture of the two oxides seldom occurs, and then only in fusible porcelains. The yellow coloration is far more intense than the green; the latter results when a reducing flame is employed, and porcelain colored pale green thereby becomes yellow by repeated heating in an oxidizing flame, the ferrous iron being converted into ferric. The green color of Indian and Chinese Celadon porcelain is due to its containing 1.5 to 2.0 per cent. of ferrous oxide. Normal white porcelain, when slowly cooled, assumes a yellow tinge, also due to oxidation, and for this reason it is customary to cool the mass rapidly. The author has never observed any yellow coloration produced by sulphates; in fact, sulphates only occur in very basic and not in the very acid silicates such as porcelain. Also the magnetic oxide of iron is reduced either to ferrous or ferric oxide in presence of silica, and in its absence the metal would result, so that the idea that the whole of the iron is converted, at the high temperature employed in the burning into Fe₂O₃, is out of the question. These remarks regarding the coloring of porcelain also hold good in the case of glass.

The following, from an unknown source, is worthy of consideration: "If the theory of the 'theoretical' man is true theory, and if the practice of the 'practical' man is correct practice, then the theory and the practice will fit each other line for line and dot for dot. The practical man becomes a theoretical man when he begins to give his reasons for doing as he does. If a man learns those laws of nature which relate to mechanics from books or lectures and then applies these laws to practice and makes no mistake in their application, he comes squarely face to face with the man who begins at the 'practical' end and works up till he learns the same laws. They start at opposite ends of the same path, but both get there all the same."

Pauper labor is crowding into the coke regions about Connellsville, in Pennsylvania, as well as into the anthracite coal country. The foreign labor importation among the coke ovens is mostly Hungarian, and nearly 10,000 of these people have been induced to go into Fayette and Westmoreland counties within the past few years, and the American laborers have been almost totally displaced. Most of these Hungarians who have taken possession of the coke regions originally came from Baltimore.

The American Sheet Iron Works, at Phillipsburg, N. J., after an idleness of several weeks, started up again on the 14th inst.

Combined Plumbers' and Tinnern's Furnace.

The Ringen Stove Company, of St. Louis, Mo., are offering the trade a very desirable heating furnace, adapted for plumbers' and tinnern's use, a perspective view of which is presented in the accompanying engraving. It is designed especially for out-of-door use, as the burner is fully protected from the wind. It has a capacity for heating two soldering-irons at a time, which are introduced through the side door shown in the upper part of the pot. The door, when open, forms a sort of shelf or rest for the support of the irons when being heated. In order to change the device into a plumber's furnace it is simply necessary to close the side door and

Quick Meal Plumbers' and Tinnern's Furnace.

open the lid. The pot containing the lead to be melted is placed directly over the flame, which spreads out and entirely covers the bottom of the vessel. The furnace is provided with a bail, which renders transportation a very easy and convenient matter, and it weighs complete only 12 pounds. After the tank has been filled air pressure is introduced by means of the rubber pump clearly shown in the engraving. The manufacturers state that it will burn for several hours without attention. It is sold under the name of Quick Meal.

Hull's Campaign Torch.

The rapid approach of the time when torchlight processions will be the fashion in every city, town and village in the country has turned the attention of certain manufacturers to the production of torches adapted to meet the requirements of the occasion. Among the more recent candidates for public favor may be mentioned the device being offered the trade by Mr. M. L. Hull, of Cleveland, Ohio, a view of which is presented in the accompanying engraving. The device consists of a

rod made in two sections, having at the upper end a gasoline burner, while just below the upper section of the rod is placed a tank for the fluid, having a capacity of about 3 quarts. Connected with the tank is a flexible handle, which may be employed as an air pump for forcing

Hull's Campaign Torch.

air into the tank. The light produced is claimed to be far superior to that of ordinary coal-oil torches, while all parts are made perfectly tight, so that no gasoline can escape. An occasional squeeze of the handle is said to be all that is necessary to keep up a bright light. The lower section of the rod is painted, which enables the torch to be set upright in the ground when not in use. The manufacturer states that these torches are light and durable, that they can safely be carried in any position or angle, and that they are specially designed for the use of clubs in the larger cities.

Smelters' Ladle.

A very convenient article for the use of plumbers, smelters, tinnerns and all who have occasion to melt lead, tin or zinc, is being offered the trade by S. A. Suydam, of No. 550 Hudson street, New York. It consists of a ladle made without seam or joint, stamped from sheet steel of No. 15 gauge. It measures 4½ inches in height, has a bottom diameter of 6¼ inches, a top

Smelters' Seamless Steel Ladle.

diameter of 8¼ inches, and a lip which projects 3¼ inches. It has a capacity for one gallon. In the engraving is shown a handle, 12 inches in length, designed for attachment to the side of the ladle and to facilitate turning out its contents. The bail is rigidly fastened by three rivets on

each side. The ladle is made of a single piece of metal and is stamped complete with the lips.

Kemper's Garden Sprinkler.

Messrs. Theodore Michel & Co., of No. 751 Wabash street, St. Paul, Minn., are offering the trade a form of potato-bug exterminator for which they make many strong claims. The reader may gather a very clear impression of the general arrangement of the device from an inspection of the cut presented herewith, which shows the sprinkler ready for use. The tank is made of galvanized iron, finely varnished and striped, giving it an ornamental appearance. Its capacity is about 2½ pails of water, with which is mixed the paris green or other poison. Within the tank is an arrangement for agitating the contents, said mechanism being connected with a lever, shown at 2 in the engraving. From the end of this lever depends a strap, by means of which the operator may keep the

Kemper's Garden Sprinkler.

contents of the tank in a constant state of agitation. From the bottom of the tank is led a rubber hose, on the end of which is a fine sprinkler or nozzle for throwing the mixture contained in the tank upon the plants. Three sizes of nozzles accompany each sprinkler. In the nozzle, 3, is placed a valve which enables the operator to control the quantity of water issuing from it. The manufacturers state that vines may be very rapidly sprinkled by the use of this device, and that it requires less water and poison for a given number of feet than is necessary by the old method. The claim is also made that with small potatoes and a fine sprinkler the tank need be filled but twice for an acre, while once filling is sufficient for a row 1000 feet in length.

Within the past ten days nearly 100 vessels have been engaged, with a capacity of 600,000 barrels, to load petroleum for Europe, which does not look as though the tank steamers were absorbing the trade.

The Bucket Pump.

The rapidly growing belief on the part of the general public that all water intended to be used for domestic purposes should be more or less purified has turned the attention of manufacturers of pumping apparatus in this direction, and numerous devices are being brought out which are claimed to accomplish the objects sought. Among the concerns working in this direction may be mentioned the Water Elevator and Purifier Company

The Bucket Pump.—Fig. 1.—Complete Fixtures Ready for Placing in Position in the Well.

of 441 and 443 Plum street, Cincinnati, Ohio, who have placed upon the market a bucket pump and water purifier, several views of which are presented in the accompanying illustrations. This pump consists of an endless chain composed of buckets, made of a single piece of sheet iron, suspended in the curb by an iron top wheel, so constructed as to prevent any wear in the buckets and the bottom wheel. In Fig. 1 are shown the fixtures complete as they are ready to be dropped through the well curb into the cistern, the bottom wheel resting in the chain unfastened. The buckets are attached to steel-wire links by double flanges and connected together by flat annealed-steel links, one of which is shown in Fig. 2, all being thoroughly galvanized. The bot-

Fig. 2.—Flat Steel Link for Connecting the Buckets.

tom wheel is made of three pieces of fine quality sheet steel, put together without bolts, rivets or solder. The spout and receiver are made of the best galvanized cast iron, the principal features of which are covered by patents owned by the company. A double gearing, with shield, is provided to guard against injury from catching the fingers in the cog-wheels and is also a protection from ice in winter. The endless

chain, the manufacturers state, is sufficiently strong to sustain a weight equal to ten times the quantity of water raised. It is formed of alternate double-flanged, one-piece buckets and flat links made of the very best galvanized iron and is prac-

tically a solid chain. Fig. 3 of the illustrations shows one of these buckets as it is formed over the round steel link, while Fig. 4 represents a single-piece bucket as it appears before it is formed into the shape shown in Fig. 3. The pump has a capacity of 10 gallons of water per minute, and is so constructed that it can be easily operated, even when used in connection with deep wells. The manufacturers claim that it never freezes, having in the past successfully stood a test of 38° below zero. They also claim that in operation the water is purified by the cups or buckets carrying to the bottom of the well at each revolution of the chain as many gallons of air as there are gallons of water carried to the top, so

that whenever the chain is in motion a constant current of air is passing through the water.

The hardships resulting from an overstocked labor market were illustrated in the course of the examination in this city last week before the Congressional Com-

mittee. A young woman who had worked for six years in a shirt factory in New York testified that formerly the employees, mostly American girls, earned from \$7 to \$9 per week. Of late Russian and Polish immigrants have been introduced into the factories and wages have been forced down so that it required hard work to earn \$5 a week. These imported Russian and Polish workers, accustomed to low wages and a

wretched mode of living, are willing to work for \$4 a week. An English woman who came to this country six years ago said that at that time she could earn \$10 a week making cloaks and shirts, and now she was lucky if she got \$5, sometimes not

Fig. 3.—View of Single-Piece Flanged Bucket.

making more than \$2 or \$3. Mrs. Anker who has made a study of the condition of working women in this city, declared that women who ten years ago averaged \$10 or \$12 a week working upon white goods, could now hardly make \$5, and those who worked for contractors were forced to be satisfied with \$3. These are only illustrative cases.

The indications of natural gas at Chicago, which were so promising a few months since, had vanished completely, when new interest was aroused on the 8th inst. by a sudden flow from an artesian well which was being sunk at a malt house on Cedar street. The well was but 80 feet deep

Fig. 4.—Single-Piece Bucket Before it is Formed into the Shape Shown in Fig. 3.

when the gas rushed out. It was ignited and the blaze shot up 8 feet at first, but on burning all night it gradually subsided until it was only 18 inches high, and appeared likely to continue to become more feeble.

The new Argentine Pacific from Buenos Ayres to the foot of the Andes has on it what is probably the longest tangent in the world. This is 340 km. (211 miles), without a curve. In this distance there is not a single bridge and no opening larger than an ordinary culvert, no cut greater than 1 m. in depth, and no hill of a height exceeding 1 m. There is almost an entire absence of wood on the plain across which the western end of the road is located. This has led to the extensive use of metallic ties, which will be employed on nearly the entire road.

A novel electric railway is undergoing construction in a suburb of St. Paul, Minn. The railroad is an elevated structure, and the cars are hung below it close to the street level. They hang from sets of wheels taking their power from the tracks, which are charged with electricity.

The Wheeler System of Reflectors.

The Wheeler Reflector Company, 24 Washington street, Boston, Mass., as proprietors of the Wheeler System of Reflectors, manufacture a great variety of

Fig. 1.—Street Light.

lamps and lanterns of all kinds fitted with the Wheeler reflectors. These reflectors are adapted to general use, utilizing, it is claimed, all the light possible and distributing it where it is needed. They are adapted, furthermore, to all methods of lighting, and can be applied with little, if any, change to the present fixtures. Their shapes and forms vary according to circumstances, special reflectors being made for almost every conceivable place. The increased efficiency of a light with these reflectors claimed by the manu-

Fig. 2.—Stable Lantern.

facturers is over 300 per cent., due to utilizing the light which is ordinarily dispersed where not wanted. It is pointed out that under this system the number of burners may be greatly reduced, while at the same time there will be an increase of light. The system consists of forms made up by combinations of surfaces generated by the revolution of one or more of the "conic sections" about one or more axes of revolution. The surfaces are so arranged about the light as to give a uniform intensity of light over the area and also to intercept the rays which usually go upward and are lost. The reflectors, which are usually made of heavy tin, japanned or plain, as desired, are described as being very strong and rigid and yet of a neat and graceful appearance. They are

usually lined with imported crystal glass, which is backed with pure metallic silver, well protected by a coating, rendering it impervious to moisture, gases and other injurious influences. The glass is cut into small facets to fit various forms of shells, the result being, it is said, that a pleasing light is produced which is neither glaring nor blinding. Where greater ornamentation is desired, polished brass, nickel or copper shells are substituted for tin. It is pointed out that the reflectors, being made of a number of pieces of glass, are not easily destroyed by a single blow, and the manufacturers particularly call attention to the fact that the merit of their system is due to the forms used, rather than to any superior excellence of materials employed, though they are claimed to be of the best. In case of breakage facets will be supplied at 5 cents apiece, and can easily be put in place. To illustrate the sys-

Fig. 3.—Wall Bracket Lamp.

tem of reflectors we present herewith a few of the different kinds in use. Fig. 1 shows the reflector as applied to street lights, for lighting up and down a street by gasoline, the reflected light being thrown sideways in the two opposite directions. Fig. 2 represents a form of railroad, porch or stable lantern. The reflector in this lantern throws a straight light to the front, besides throwing an equally powerful light diagonally at each side, spreading it uniformly. This is especially recommended for lawns, yards, stables and all places where it is desired to throw a light uniformly over consid-

light longitudinally in two opposite directions. It is adapted to any kind of electric light, with either single or double carbons and with globes of 12-inch diameter or less. In addition to the lamps which we have illustrated and mentioned the

Fig. 4.—Electric Arc Light.

Wheeler Reflector Company make a great number of others.

A New Stove Truck.

The H. & D. Truck Company, of Elizabethtown, Pa., have just brought out a new stove-truck, a general view of which is presented in the engraving here given. The device is constructed of malleable iron and steel, and is very durable in all its parts. The manufacturers claim that it is easily operated, weighs only 40 pounds and is capable of carrying a load of 500 pounds. It is so constructed that one man can use it, and it may be turned, it is claimed, in its own length. A very good idea of its method of operation may be gained from the following directions read in connection with the engraving herewith presented: Throw forward the handle, which, in the normal position of the truck, is at F to D. Bear lightly upon it and, with the first two fingers, catch the wire loop shown between the handles. Draw this forward and release the hook from the front cross-bar. Elevate the handle

A New Stove Truck.

erable space. In Fig. 8 a wall-bracket lamp, which is made in several sizes and styles, is illustrated, the shape of this reflector closely resembling the one used in the lantern just described, and serves the same purpose of diffusing the light equally throughout a room. The illustration, Fig. 4, shows one style of electric-light reflectors. This overhead reflector is especially adapted for use in streets, mills, railway stations, or any place where it is desired to distribute the

above the upright pins in front of the cross-bar and give the wire a sudden strong pull, which allows the frame to drop down flat. Run the bench under the stove to be moved, elevate the handles until they engage with lips on the lower part of the front bracket, bear down until the hook catches the front bar, and the load is ready for removal to its destination. In order to unload proceed as described, taking care, however, to keep hold of the handle until the stove is at rest.

CURRENT HARDWARE PRICES.

AUGUST 15, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

THE IRON AGE

THURSDAY, AUGUST 23, 1888.

Improved Diamond Prospecting Drills.

An improved form of diamond prospecting drill is now being put on the market by the American Diamond Rock Boring

respectively. The diamonds of the first-mentioned row cut the path of the drill in its forward progress, while those upon the outer and inner periphery of the tool enlarge the cavity around the same, and admit the free ingress and egress of the water. The bit is screwed to the core-barrel or spiral grooved guide, and this to the drill rods, which are made of heavy lap-weld tubing, and added section after section, as the hole deepens. When the drill-rods, with bit attached, are rotated and fed forward, the bit passes into the rock, cutting an annular channel. That portion of the stone encircled by this channel is, of course, undisturbed, and the core-barrel passing down over this keeps it intact until the rods are withdrawn, when the solid cylinder thus formed is brought up with them, a "core-lifter"

double cylinder reversible engine, mounted either on bed-plate or an upright or horizontal tubular boiler. The capacity of the engine varies according to the depth and size of the hole which the drill is required to bore.

Fig. 1 represents a front view of what is known as the No. 3 drill. It is operated by regular reciprocating engines, with cross-head and steel connecting rods and simple reversing arrangement. The valve motion is on the regular plan for hoisting or locomotive engines. The driving gears are of composition metal, and the engines can be run at a very high rate of speed, without vibration. Hydraulic feed is employed, replacing the differential feed on the boiler machines. By this the feed motion is accomplished, as its name indicates, by hydraulic pressure, through the

Fig. 1.—Front View.

Fig. 2—Side View.

IMPROVED DIAMOND PROSPECTING DRILL, BUILT BY THE AMERICAN DIAMOND ROCK BORING CO., N. Y.

Company, 15 Cortlandt street, New York, the engravings in this impression illustrating its main features.

It may not be without interest to explain here that the principle of the diamond drill lies, first, in the rapid rotation of a hollow "bit," of which the cutting edges are the diamonds, set up in such a manner that they are the only parts of the tool that come in contact with the rock; and second, in forcing a stream of water down through the interior of this bit, passing up outside of it and carrying away the material ground up by the diamonds. The hollow bit is a steel thimble, having three rows of diamonds (bort or carbon) embedded in it, so that the edges of those in one row project from its face, while the edges of those in the other two rows project from the outer and inner periphery

breaking it at the bottom of the hole and securely wedging it in the core-barrel.

At the upper end of the drill-rods is a water swivel, with connection with the steam pump. By means of this pump a constant stream of water is forced down through the hollow drill-rod, keeping the bit cool and the hole clear of sediment, which is forced by the water pressure up the outside of the rods to the surface. When a core is not required a solid bit may be used, the detritus being washed out by the water, as when boring with the annular bit. These general principles of boring with the diamond drill are always the same, the different machines, by comparatively slight changes, being applicable to any kind of rock drilling. For deep boring, for wells or for prospecting mineral lands we use a machine with

medium of two small cylinders and pistons, the piston rods being connected by a suitable cross-head to the plain hollow spindle, which carries the drill rod. Both ends of the hydraulic cylinders are connected by a system of pipes and hose to the pumps that supply the water necessary in drilling with the diamond bit. The quantity of water admitted to the cylinders is controlled by a four-way cock, which also admits water to either end of the cylinders, as the operator may require. Thus, it will be readily understood, the amount of pressure on the bit is directly under the control of the operator, and only limited by the water pressure from the supply pumps, the range being, in ordinary cases, from nothing up to 4000 pounds. The changes through the whole range of pressure, and also the reversing of the motion

of the feed, are accomplished by simply moving a small lever, while the machine is running at full speed. A pressure gauge is placed on the pipe leading to the hydraulic cylinders, so that the operator can at all times just see how much pressure there is on the bit. With any constant pressure this feed gives a very perfect automatic adjustment of the speed with which the drill is fed forward, the rate of progression depending upon the hardness of the material, being from frequently less than 1 inch per minute in very hard rock, to over 2 feet per minute in a soft substance like coal. This carries the additional advantage with it, that the operator, after some experience, can, by comparing the pressure shown by the gauge with the rate of penetration of the drill,

the stratification and character of the mine or quarry at any depth. The No. 1 drill which the company build is the same as that just described, but is mounted on a carriage with a boiler outfit. The bit is 2 inches in diameter, and the core $1\frac{1}{4}$ inches. The weight of the No. 3 machine is 1800 pounds, the heaviest piece weighing about 250 pounds.

In Fig. 4 we show an underground prospecting and mining drill, which will bore a $1\frac{1}{2}$ -inch hole 250 feet in any direction, taking out a 1-inch core. This drill can be run either by steam or compressed air, and is especially valuable in sinking shafts, driving tunnels, or in any possible position where any kind or style of drill can be used. In underground prospecting its lightness, combined with ease of man-

sudden strain upon the cutting points incidental to drilling through soft into hard rock is thus avoided.

The tubular drill-rod passes through the screw-shaft, and is held firmly by a chuck, the motion of the screw-shaft being thus communicated to the drill-rods and bit. In order to run the screw-shaft back after it has been fed forward its full length, it is only necessary to release the chuck and to loosen the nut on the frictional gear, thus allowing the gear to run loose; then the screw-shaft will run up with the same motion which carried it down, but with a velocity 60 times greater. The chuck and nut are then tightened, giving the screw-shaft a grip on the drill-rod in a new place, and the drill is ready for another run. The drill-rods may be extended to

Fig. 3.—Drill with Hinged Swivel Head Open.

Fig. 4.—Underground Prospecting and Mining Drill.

IMPROVED DIAMOND PROSPECTING DRILL, BUILT BY THE AMERICAN DIAMOND ROCK BORING CO., N. Y.

tell about what kind of material the bit is boring through and can make use of the knowledge thus obtained, either for speed or for safety.

The swivel-head is hinged and so arranged that by simply loosening one bolt it can be opened and swung out of the way when withdrawing the drill rods from the bore hole or replacing them in it. This will be more clearly understood from Fig. 3. It can also be turned or "swiveled" so as to adjust the spindle for boring vertically, horizontally or at any desired angle. The large hoisting-drum is fitted for wire rope, and is capable of handling 1000 feet of drill rods with a single whip. A slip drum is attached to same shaft for use in driving casing.

The drill will bore vertically, horizontally or at any angle, to a depth of 1000 feet, taking out a core or sample of the rock penetrated. These samples are not disintegrated fragments of rock, but continuous solid cylinders, showing clearly

agement, makes it particularly valuable. A differential feed is employed. For this purpose the machine is fitted with a grooved screw-shaft, feathered to the lower sleeve gear. This is a double gear, connecting by its upper teeth with a beveled driving gear, and by its lower teeth with the release gear—a frictional gear at the bottom of the short feed-shaft. At the upper end of the feed-shaft another gear is feathered, connecting with an upper gear on the screw-shaft. This last gear is attached to the feed-nut, in the thread of which runs the screw of the screw-shaft, and, as the gear of the feed shaft has one or more teeth than that of the feed-nut, the nut makes fewer revolutions in a given time than the screw-shaft, thus producing the differential feed. The frictional gear on the bottom of the feed-shaft combines with this a frictional feed, making the drill sensitive to the character of the rock through which it is passing by maintaining a uniform pressure. The severe and

any desired length by simply adding fresh pieces of tubing, the successive lengths being quickly coupled together. In order to secure compactness the driving cylinders are of the oscillating type. The drill is a convenient tool, and for many purposes will be found to be of great value.

The specific heat of air at constant pressure being 0.2377, the specific heat of water, which is 1, is therefore 4.1733 times greater under ordinary circumstances. A pound of water losing 1° of heat, or 1 thermal unit, will consequently raise the temperature of 4.17 pounds, or, at ordinary temperatures, say 50 cubic feet of air, 1° . A pound of steam at atmospheric pressure, having a temperature of 212° F., in condensing to water at 212° F., yields 965.7 thermal units, which, if utilized, would raise the temperature of $5 \times 965.7 = 48,285$ cubic feet of air 1° , or about 690 cubic feet from 0° to 70° F.

Adjustable Clamping Blocks.

The Energy Mfg. Company, 1115-1123 South Fifteenth street, Philadelphia, Pa., are bringing out a new clamping block for securing work on planers, shapers, drills, boring machines, &c. The engraving, which we annex, represents a section of a planer with the clamps holding a piece of work to the table. It will be noticed that instead of using wooden pieces and scrap, to fill under the outer ends of clamps, adjustable clamp blocks are used which have teeth and are bolted together. This prevents their giving, no matter how much strain is brought upon them by the clamp bolts. The blocks can be used in a number of places to advantage, and will save considerable time. They are made in four sizes.

Cost of Importing Tin Plate.

Some time ago a correspondent suggested to us the advisability of publishing in our columns a set of rules, with tables and other data, for figuring from the English quotations the cost in American

add 3 per cent. to cover the insurance, consular charges, &c., and the sum will be the cost of the plates on ship at Liverpool. The next item to take into account is the ocean freight, which is of course a variable factor depending upon the current rates, and also upon the ship, the "tramp" steamers charging less than the regular Transatlantic liners. At present the freight rates are from 8/6 to 9/ per ton, but within four years they have been as high as 16/ Having made proper allowance for the cost of carriage, there remains the duty, which is 1 cent a pound. This scheme of estimating assumes that the plates were bought for cash in England, which would necessarily be the case unless the buyer had an established credit abroad. If bought on time interest would, of course, have to be added. We believe, however, that it is the invariable rule in the tin-plate trade for the importer to pay cash, though the consumer who buys the plates from him in this country gets credit.

To illustrate by a practical example, let us assume that a consumer wishes to purchase 500 boxes IC 14 x 20 Bessemer steel plates, coke finish. At 13/ per box, f.o.b.

1 per cent. and figuring on 10 per cent. above the cost of the plates, or \$1674.82, we find it to be \$8.37; adding this to \$1539.02 we find the cost of the plates insured to be \$1547.39. As mentioned above the freight rates vary according to circumstances, but 9/ per ton of 2240 pounds may be taken as the current charge. The gross weight of the 500 boxes, at 120 pounds per box, will be 60,000 pounds, or, say, 27 tons, which, at 9/ per ton, cost 243/, or about \$60; adding this to the cost of the insured plates we get \$1607.39 as the cost of the plates on dock at New York. Though the plates are now in this country the purchaser cannot obtain them until he has settled with the custom house. To avoid the trouble of attending in person to the payment of duties it is usual to employ a custom house broker who will charge, say, \$3.50 irrespective of the value of the invoice. It may be mentioned that this is a low charge for brokerage, it being \$5 at the other ports of entry. The 14 x 20 IC plates weigh about 108 pounds net to the box, and as the tariff is 1 cent per pound, the duty on the lot will be \$540, or \$543.50 with the brokerage, no account being taken of certain minor custom house fees. Adding this to \$1607.39, the cost of the plates on dock, we find the total cost of 500 boxes IC 14 x 20 Bessemer cokes, delivered on dock in New York, to be \$2150.89, or \$4.30 per box. At 13/ per box Liverpool the plates were worth in our currency, say, \$3.17, so that the total charge per box of importing was \$1.13, or about 35½ per cent. on the quoted foreign price. We would not have our readers take the above example as a reliable guide, for apart from the varying freight, insurance and other charges, there are a number of expense items which it would be impossible to correctly allow for in a suppositive case, but which must always be met in an actual business transaction. Not to mention the trouble involved, which ought to be entered at a cash valuation, there is the general item of interest, which cannot be definitely specified.

Furthermore, there is no account taken of possible delays, or perhaps it would be nearer the truth to say probable delays—and, finally, if the plates are not of a satisfactory quality, the individual buyer has no foreign agents or correspondents through whom he can obtain redress. A company whose sole business is the importation of tin plates of course "know the ropes" perfectly, but to a novice in the trade these same "ropes" will present an inextricable tangle. The example we gave was made as simple as possible, being a single large order for one grade of plates, but where a buyer wanted several kinds of plates, or maybe only a few boxes, the trouble and expense of importing direct would be proportionately increased.

Steel rails weighing 90 pounds per yard have recently been rolled by the Bethlehem Iron Company, of Bethlehem, Pa., for use on the Reading Railroad. These are said to be the heaviest steel rails ever rolled in this country. It is rumored that both the Reading and Jersey Central roads are going to renew the track on their main lines across New Jersey with steel rails weighing from 89 to 92 pounds per yard.

A joint committee of the City Council and the Board of Trade of Akron, Ohio, made a tour of investigation to ascertain what system would best be suitable to provide the city with gas for fuel and lighting. They looked into the Westinghouse, Loomis and Archer systems, and their report, an interesting document, which is favorable to the Loomis system, has been printed in pamphlet form, by T. William Harris & Co., of 44 Broadway, this city, who are builders of the Loomis plant.

ADJUSTABLE CLAMPING BLOCKS, MADE BY THE ENERGY MFG. CO., PHILADELPHIA, PA.

currency of tin plates laid down in this country, allowances being made for all ordinary charges, such as commissions, freights, &c. At first sight this appears to be a very simple problem, but a little investigation will soon discover its difficulties. Many a large consumer of tin plates, in the hope of saving money, has attempted to import his plates direct, but we do not know of a single instance where the experiment has proved a success, or, if fortunate enough to obtain his plates at prices a little under the jobbers' quotations, the troubles, delays and vexations experienced have far more than outweighed the little money gain, and rarely if ever has the consumer been tempted a second time to import direct. Notwithstanding the impracticability of the tin-plate consumer buying abroad, it may be of interest to describe, in a general way, the method of figuring the cost of plates laid down, in New York for instance. A rough rule for the purpose is to figure the shilling at 25 cents, which is a little in excess of its actual value, the difference (2 to 3 per cent.) covering the foreign charges. Having thus reduced the English quotation in shillings and pence to American currency, the freight, insurance and duty are then added and the sum will be the approximate cost of the plates delivered here. Or, to be more exact, take the quotation f.o.b. Liverpool, deduct 4 per cent. for cash, then reduce this net price to currency according to the quotation for sight exchange. To this

Liverpool, the cost would be 6500/ or £325. With sight exchange at \$4.88, this would amount to \$1586. Deducting 4 per cent. for cash, we find the net price to be \$1522.56. Though the term f.o.b. should mean delivered on the ship without charge, in reality plates so quoted are too often only f.a.s. (free at ship), and it is not unfair in an example of this kind to allow 1/3 or, say, 30 cents per ton for cartage and handling. In the case considered, this would be \$8.10, and adding also the town dues of 9d. or 18 cents per ton, amounting to \$4.86, we get the sum of \$1535.52. The consular invoice, the charge for which varies somewhat at different ports, must next be taken into account. It should be borne in mind that the consular charge at any given port is the same, whatever the value of the invoice, and while it will be relatively a small item on a large importation the percentage will increase with the lessening value of the invoice. Assuming it to be 14/, or \$3.50, the cost of the 500 boxes of plates on board ship at Liverpool will be \$1539.02. The importer may insure his plates against either partial or total loss, and as there is more chance of the plates being damaged on the voyage than totally lost, it goes without saying that the insurance rates against partial loss are the greater. Present rates are from ½ to ¼ of 1 per cent. to insure against total loss, and ¼ to ¼ of 1 per cent. to insure against partial loss. We believe it is common practice, however, to insure only against total loss, so taking the rate at ¼ of

Influence of Aluminium on Cast Iron.*

BY W. J. KEEP, C. E.; PROF. C. F. MABERY, S. D., AND L. D. VORCE.

Aluminium is a metal obtained from its oxide, alumina. It is white in color and very tenacious, and it alloys readily with iron. Cast iron, ordinarily used, is iron which contains all the carbon that it could absorb during its reduction in the blast furnace. This carbon, when found in chemical union with the iron, is called "combined carbon." In this state it cannot be seen. It is also found mechanically mixed with the iron in the form of graphitic carbon, when it becomes visible. Other elements commonly found in cast iron are phosphorus, sulphur, manganese and silicon. The natural condition of carbon in iron is the combined state. The presence of silicon drives a portion of the carbon into the graphitic state. Sulphur, manganese and phosphorus do not cause the carbon to leave its natural combined state, and if silicon be present these elements either drive it out or overpower it. Carbon is, therefore, a passive element, and is made to change its form by the presence of other elements. It is this change of carbon which indicates, to the eye, the influence of any element upon the cast iron. Iron and combined carbon, or carburized iron, is called "white iron," and the grain is generally very fine, and often even, and the metal is very hard. Graphite darkens the fracture until it becomes a very dark gray, and the grain is coarse and irregular. With increase of graphite the metal becomes soft. We shall confine ourselves in this paper to the influence of aluminium upon cast iron.

Let us for a moment review the present knowledge on this subject. It is known that fused wrought iron, or a mixture of cast iron and steel or steel alone, either of which would make castings which would be full of blow-holes, will make solid and homogeneous castings if as small a quantity of aluminium as one-tenth of 1 per cent. is added just before pouring. Also that such addition causes the iron to remain fluid long enough to allow its being cast into molds. It seems to be the general opinion that the aluminium does not remain in the metal, but that it exerts its influence between the time of its introduction and the time of its departure. This seems to be the sum total of the present information regarding the influence of aluminium upon iron.

We propose in this paper to give the results of a series of very carefully conducted tests, to further substantiate the statements just made, and to settle the question as to whether aluminium remains in the casting. Also to determine the influence of this metal upon the physical structure and upon the composition of iron. The physical tests that we have employed are what are known as "Keep's tests," and by them we are enabled to make apparent to the eye the influence of any element upon cast iron. When it was understood that we were to undertake this examination, the Cowles Electric Smelting and Aluminium Company, of Cleveland, kindly furnished us with what ferro-aluminium we needed, and Prof. C. F. Mabery and L. D. Vorce, of the Case School of Applied Science, of Cleveland, volunteered to undertake the chemical examination of the test bars. The results of these investigations will be appreciated when it is understood that we began without the expectation of the very important results we have obtained, and that the methods for the determination of minute quantities of aluminium were so imperfect

that the small quantities used in the "Mitis" process could not be determined if they still remained in the castings.

Regarding the physical tests, we should state that we use two bases—one a white iron, with composition, Si., 0.186, P., 0.263, S., 0.0307, Mn., 0.092; the other a gray Swedish iron marked "FL M." with composition Si., 1.249, P., 0.084, S., 0.04, Mn., 0.187. The ferro-aluminium contained Si., 3.86 and Al. 11.42 per cent. The melting was done in a covered plumbago crucible, in a coke furnace driven by a blast of 2½ ounces. The test bars were 1 foot long, and cast in pairs; one ½ inch square, and its mate ⅞ inch thick and 1 inch wide.

We started with 30 pounds of the base in the crucible; at the first heat there were cast four pair of bars from the base alone, which took 5 pounds of metal. After allowing the remaining metal to become solid, we returned the runners of the first cast, and added 4 pounds of the base, and returned the crucible to the furnace. When nearly melted, we added enough ferro-aluminium to bring the percentage of aluminium in the whole to where we wished it, for the second set of bars. We proceeded in like manner through the entire series of heats. To arrive at the influence of the aluminium, we made another series of heats, with the same base, with exactly the same conditions, only we did not add the aluminium. The difference between the two series of tests gives the effect of the aluminium.

We shall consider this subject under the following heads:

The solidity of castings and the prevention of blow-holes.

Does the aluminium remain in the iron to exert an influence when the iron is remelted?

The effect of aluminium upon the grain or the changing of the carbon from the combined to the graphitic state.

The taking away the tendency to chill.

The prevention of sand scale.

The effect upon hardness.

The resistance to a load gradually applied or a dead weight.

The resistance to a load suddenly applied or impact.

The elasticity.

Permanent set.

The effect on the shrinkage of the iron.

The fluidity of the melted metal.

1. *The Solidity of Castings and the Prevention of Blow-Holes.*—All of our tests bear upon this subject, but we have made one test, using the white base iron, and one-tenth of 1 per cent. of aluminium. It is also impossible to get a solid casting of the white base alone, and its resistance to weight is generally about 175 pounds for the ½-inch square bars, and its resistance to impact is about 100 pounds. We have obtained, however, exceptionally sound castings of this base, and we shall use the strength of such castings for comparison. These sound castings of the white base alone resisted a weight of 379 pounds. With one-tenth of 1 per cent. of aluminium added, it resisted 545 pounds, a gain of 166 pounds, or about 44 per cent., from this small addition. Measuring the resistance to impact the white alone was 239 pounds; with aluminium, 254 pounds, or about 6 per cent. gain. The castings appear of slightly finer grain, and the character of the crystallization is somewhat different, but the secret of the strength lies in the closing of the spaces between the grains—or, in other words, in the increased solidity of the casting. No other change is noticeable in the metal. A graphic representation of this test is not needed.

2. *Does the Aluminium Remain in the Iron to Exert an Influence When the Iron is Remelted?*—To determine this we made a series of six heats from the white base, and added to the first heat one-fourth of 1 per cent. of aluminium. This amount alters the grain very perceptibly, making it whiter and finer, and removing the tendency of

the base to a slight specular appearance, and giving a homogenous fracture. It increases the strength above the base about 20 per cent. to resist weight, and for impact an increase of over 70 per cent. The next heat was a remelt of the first, with the runners of the first cast put back, and enough white base added to reduce the aluminium to two-tenths of 1 per cent. when the second cast was made. Our comparisons will now be made between this series and the comparison series of the base alone. Looking at the chart, Fig. 1, we see that

Fig. 1.

the effect of the aluminium in this second heat is greater than it was in the first case to which heat the aluminium was added. This is due to the increasing porosity at each heat of the base when melted alone, and to the solidity of the series with aluminium. At the third and subsequent heats the same result is apparent, the remaining aluminium causing more solid castings, though the continued additions of white iron at each heat, and the consequent lessening of aluminium, render the castings less strong at each remelting. Yet the effect of the aluminium is so constantly apparent at each melt as to leave no doubt as to the presence even in the sixth remelting. The chart, Fig. 1, which we have prepared, shows these effects, both as to weight and impact.

As we proceed with the description of other tests, it will be noticed that we add but a small quantity of aluminium at each heat, and depend upon the additions made at previous heats to bring up the required percentage. The results of the tests show conclusively that the aluminium remains and exerts its influence in subsequent casts as fully as would be expected.

3. *The Effect of the Aluminium upon the Grain, or the Changing of Carbon from the Combined to the Graphitic State.*—Let us say a few words in regard to the way in which, and the reason why, carbon takes on the graphitic form. All of the carbon, both combined and graphitic, which the iron is capable of holding when solid must be dissolved and exist as combined carbon in the melted iron. Cast iron made in the usual way contains all of the carbon that it can hold. Very often cast iron, when melted, contains more carbon than it can hold in combination when at a lower temperature; if so, as the iron cools down such excess of carbon will separate and rise to the surface. In any case, when a melted iron contains more carbon than the iron can hold in combination when cold, all of the excess will not be able to reach the surface, though it may not be visible in the casting to the eye. The introduction of other elements into the melted metal may alter its ability to hold the carbon. Sulphur causes it to let some go, while manganese enables it to hold more carbon in solution. Silicon also somewhat diminishes the capacity of the molten

* Read by W. J. Keep, at the Cleveland Meeting of the American Association for the Advancement of Science, August 17, 1888.

metal to retain carbon while it is in liquid. Aluminium allows most of the carbon to retain its natural combined form until the metal is too thick for the separated carbon to escape, but at the instant of solidifying aluminium causes the iron to drop a portion of its carbon from the combined state. This liberated carbon takes the graphitic form, and is imprisoned in the otherwise solid iron.

The advantages arising from a change of carbon from the combined to the graphitic state, at the instant of crystallization, are that all of the carbon thus liberated is imprisoned uniformly throughout the casting, and is not accumulated in pockets, forming soft and hollow spots, as would be the case if liberated while the casting was yet fluid. Aluminium more than any known element accomplishes this. It not only changes white iron to gray, but seems at once to change the whole character of the metal. The drop of carbon seems to be instantaneous at the instant of crystallization, and for this reason the time taken in cooling has little effect. In fact, when the aluminium obtains full control of the carbon it would seem that the more sudden the cooling the more the formation of the graphite, and the thin portions of the graphite are therefore as gray as the thicker portions. The powerful and positive influence of aluminium upon the carbon, and therefore upon the grain and color of the iron, is shown by an examination of the series of samples that we present, here to-day.

Take those made from the white iron base, with almost no silicon present; the

Fig. 2.

base alone gives a white bar full of blow-holes. An addition of one-fourth of 1 per cent. aluminium gives us not only a perfectly homogeneous and solid casting, but the color is darker, and the grain shows that some of the carbon has taken the graphitic form. The thin casting shows this even more than the heavier bar, showing that the change occurred suddenly and that time had but little effect. Examining each bar in turn, we see that each similar addition of aluminium produces a corresponding effect until, at the third addition, or with three-fourth of 1 per cent., the casting is gray, with no sign of white, either in the square or in the thin bar.

The set of tests with the gray iron base, containing $1\frac{1}{4}$ per cent. of silicon, shows that silicon and aluminium work together in the same direction, and that a slight addition of aluminium takes the white out of the casting at once, giving the same grain in a thin as in a thick casting. This effect increases as the aluminium increases, and the indications are that at least up to 4 per cent., the limit of our experiments, the more the aluminium, the softer and grayer the castings.

4. The Taking Away the Tendency to Chill.—If cast iron be cooled very suddenly, the carbon, which the melted metal holds in combination, will not have time to separate, and will be retained in the combined state. Such castings are called chilled castings. Chill is caused by molten iron running against a body which rapidly withdraws its heat, causing it to retain its carbon in the combined form. Back from the chill, where this instantaneous cooling could not exert its full effect, a portion of the carbon takes the graphitic form. This property is made use of when it is desir-

able to obtain hard wearing surfaces, and, in the same casting, tough and soft central portions, as in car wheels. While this chilling effect is exceedingly valuable for many purposes, yet, generally speaking, the founder desires exactly the reverse.

We have said that aluminium causes the carbon to assume the graphitic form on

Fig. 3.

instant of solidifying, and therefore the sudden abstraction of heat does not imprison the combined carbon and cause chill. This effect of aluminium is to give a uniform grain for thick and thin castings, and not allow the coldness of the mold to affect the grain. Fig. 2 gives graphically the results of experiments made.

5. The Thickness of Sand Scale.—This is an important consideration, for the sand must be cleaned from the casting, and the surface must first be cut before the interior can be reached. To prevent the iron from burning the sand into itself and thus forming a scale, a plumbago facing is sifted on the surface of the mold, but it is difficult for the facing to lie on the surfaces or to resist the intense heat of the metal. When aluminium in an iron causes the dropping of the graphite from the mass of the metal, that graphite which is on the surface of the casting separates and forms a perfect plumbago facing, which opposes the sand and the heat. It will, therefore, be seen that in castings having sufficient aluminium to cause this separation of graphite, there will be no sand clinging to the face, and that the surface will be as soft as the interior of the casting. Every ironworker will appreciate this good effect of aluminium.

6. The Effect upon Hardness.—Hardness in cast iron is caused by the carburized or white iron in masses large

Fig. 4.

enough to oppose the tool. If the carburized iron exists in minute threads stretched around atoms of graphite, a tool will easily cut it and it will not be considered hard. This graphitic carbon, minutely dividing the mass, gives the tools of the workman a chance to cut or break the films of metal, giving what we call

softness to the iron. The later the carbon is dropped the smaller will be the atoms of graphite and the closer the grain. Yet this greater subdivision will, for the reason just given, make the iron work more easily. The fineness of the grain of iron affected by aluminium causes such iron to be much more easily cut than iron of coarser grain. The next question to consider is that of strength. The power of wrought iron and steel to resist extension is so great that where such stresses are to be resisted decarbonized metal should be used. The resistance of any cast iron to crushing is so great that we need not consider this. The forces which cast iron should be made to resist, aside from crushing, are a dead weight, or a blow applied transversely. We should, therefore, test cast iron with these forces.

7. The Resistance to a Load Gradually Applied, or a Dead Weight.—If we compare the transverse breaking weights of the two series which we have been considering, number by number, we perceive that the aluminium has increased the strength to sustain a constant load. This is a very important effect, and perhaps comes partially from the tenacity and strength of

Fig. 5.

aluminium itself, but probably more from the uniform grain of the iron. Fig. 8 is a record of the tests.

8. The Resistance to a Load Suddenly Applied, or Impact.—It may be thought that the effect is substantially the same, whether the force be a constant weight or a suddenly applied blow. We shall at a future time prove that the effects are not the same, and that an iron should be tested by a blow if it is expected to resist impact. By a comparison of the graphic representation, Fig. 4, we see that the capacity to resist impact is increased by the addition of aluminium much more than the capacity to resist a dead weight. It will be seen at a glance that the test bars made with the white base are benefited far more than those made with the gray base. The reason for this is, that the white base alone made porous castings; at each remelt this porosity increased, due to the continuation of the heat, running the strength down to 68 pounds at the fifth heat. The first, and each subsequent addition of aluminium, caused the castings to be perfectly sound, and the infinitesimal atoms of graphite deposited throughout the metal removed the rigidity and brittleness of the initial metal. The gray iron base contained enough silicon to accomplish all this, and the only effect on strength that the action of the aluminium on carbon could have would be to increase the fineness of the grain, unless the toughness of the aluminium itself could give strength to the casting, though the aluminium no doubt removed any slight blow-holes that existed in the initial gray metal. This leads us to notice that each addition of aluminium increases the strength over that of the initial metal. We must expect that after we have added enough aluminium to cause a solid casting, and to remove the brittleness that the dividing up of the mass by the atoms of graphite accomplishes, any further additions of aluminium, and consequent increase of graphite, which has no strength of itself, must weaken the casting.

9. The Elasticity.—The compactness and closeness of the grain of cast iron when aluminium was the agent by which the

graphite was precipitated and the fine attenuation of the veins of carburated iron cause the metal to be very elastic, and, as we have seen, not so brittle as without aluminium. Fig. 5 illustrates this.

10. *Permanent Set.*—This is caused by the compression of the graphite within the framework of carburated iron. When this compression of graphitic carbon is produced by transverse bending the framework of the metal also takes on a permanent form, which cannot be altered except by a greater force than was before applied. The fineness and compactness of iron alloyed with aluminium gives less permanent set than iron equally as soft when such softness is produced by silicon.

11. *The Effect on the Shrinkage of the Iron.*—The more suddenly and completely the carbon is changed from combined to graphitic, at the instant of crystallization, the more space will the casting occupy. When the casting is cold it will therefore have contracted less than if more carbon had remained combined. White iron, having most of its carbon in the combined state, shrinks from $\frac{1}{4}$ to $\frac{1}{2}$ inch in each foot. Gray iron sometimes shrinks as little

Fig. 6.

as $\frac{1}{10}$ inch to each linear foot. As the combined is the natural state for the carbon, we may say that this maximum shrinkage is the natural shrinkage for cast iron having its carbon combined. We can therefore say that aluminium takes out or reduces shrinkage when a sufficient quantity is added. This is a very great advantage, as shrinkage requires great skill in the preparation of patterns to prevent warping and cracking, and violent internal strains within the castings. The lessening of shrinkage avoids these evils, and is therefore a great gain. Fig. 6, the shrinkage chart, furnishes the most conclusive proof of our explanation of the way in which shrinkage is lessened. With both the white and the gray bases, during the first two additions, the shrinkage of the square bar is slightly increased. The influence of the aluminium thus far has been in the direction of elimination of blow-holes, and causing an even distribution of the dark and light grains. At the third addition, however, when the amount reached three-quarters of 1 per cent., the effect was appreciably felt upon the carbon, as seen by the color, and as we should expect, from the deposition of this large bulk of graphite; the casting does not shrink as much, and each addition of aluminium increasing this bulk of graphite decreases the shrinkage. The effect upon the grain and color of the thin bars of the series is very remarkable, showing that the aluminium has changed enough carbon to graphite to produce a dark even grained casting. The effect upon the shrinkage of these thin bars (see Fig. 7); is as we should expect, and is more marked even than in the square bars. The shrinkage in the thin bars of the white series shows a constant decrease as the aluminium increases, but in the series for comparison, the shrinkage dropped still more rapidly. If a new crucible was used in commencing this comparison series, enough silicon might have been absorbed to produce this effect. This leads us to remark that on account of the variations of conditions in any series of tests, that cannot be foreseen, we must avoid drawing any but general

conclusions, and these should be based upon a large number of experiments.

12. *The Fluidity of the Melted Metal.*—Our tests of fluidity (see Fig. 8) are correct as far as each individual heat is concerned, but variation may be due to the heat of the metal of that particular cast when poured. Viewed in a general way, the indications are that with the white base, with almost no silicon, the aluminium has increased the fluidity; but judging

Fig. 7.

from the series with the gray base, we would say that, combined with silicon, aluminium reduced the fluidity. Our remarks in connection with shrinkage show that a sharp casting is produced by the instantaneous dropping of graphite when crystallization takes place, and that if the iron is fluid enough to fill the mold, any extra fluidity causes the iron in shrinking to draw away from the mold. Again, the percentage of aluminium necessary to bring about these desirable results will be too small to have much effect upon the fluidity of the metal. The fact of the iron giving sharper and more perfect castings on account of the swell of the casting, caused by the deposition of graphite at the instant of solidification might cause the iron to be pronounced more fluid, if judged by the appearance of the castings. No doubt the presence of varying quantities of manganese, sulphur, phosphorus and silicon in the cast iron used would modify the influence of aluminium, and until this is understood it may require considerable experiment to determine the amount of aluminium required or how it shall be introduced.

This hurried presentation of the remarkable effects of aluminium upon cast iron will give an idea of the great benefit which is now promised to the iron founder by the rapidly falling price of aluminium as cheapened by the electric furnace. Following the publication of this part of the subject we shall soon present the results

Fig. 8.

of the laboratory work of Prof. Mabery and Mr. Vorce, which will throw still more light upon this interesting subject.

We find in an article from an unknown source the following values for the traction coefficient on different roads under ordinary average conditions: "Railroads in good condition, the axles well lubricated, 4 pounds per ton of load; upon railroads under ordinary, but not very good, condition, 8; upon a very smooth pavement, 12; on ordinary street pavements in good condition, 20; on street pavements and turnpikes, 30; on turnpikes new laid with coarse gravel and broken stone, 50; on common roads in bad condition, 150; on entirely loose ground or sand, 560."

The Perils of Steam Navigation.

Another ocean horror emphasizes the fact already established that our best built steamships have a vulnerable part which all the devices yet contrived fail to remedy. The Danish steamer Geiser, from New for Copenhagen, with 149 souls on board, while near Sable Island on the 14th inst., was struck on the starboard side amidships with terrific force by the steamer Thingvalla, of the same line. The blow was received between the coal bunkers and the engine-room. In about five minutes the ill-starred ship, which had been cut nearly in twain, was engulfed in the sea, taking down 118 persons, only 14 of the passengers and 17 of the crew surviving. The Thingvalla's bows were carried away completely as far back as the collision bulkhead, which yielded perceptibly to the tremendous pressure of the sea, but no time was lost in rendering it more secure, thus saving the ship from the fate of her consort. The Cunard steamer Oregon, it will be remembered, speedily went to the bottom, although struck only by a collier. It is always so when the engine compartment fills with water, on account of the disproportion of the flooded space as related to other divisions of the ship. Vessels built on the cellular plan of construction have been pronounced "unsinkable," but it remains to be demonstrated that they are really so when subjected to the severest test.

The loss of the Geiser will be the subject of official investigation before the Danish Admiralty Court. The material facts, however, are obvious to the ordinary reader of the news, and the conclusion seems inevitable, as expressed by high authority on the New York Maritime Exchange, that when the critical moment came, and collision seemed imminent, "either of the officers in command lost his head, or his orders were misunderstood at the helm." So long as speed is the ruling ambition and the chief reliance for commercial success in Atlantic Steam Navigation, any proposition to protect the engine compartment by means of heavy plating would be promptly rejected, since it would neutralize this indispensable quality by adding tonnage which would be superfluous except in extreme emergencies such as might never occur. Moreover, it is hardly supposable that any device of this character would endure the impact of a laden steamer like the Thingvalla, even if engines were "slowed down." Ocean travelers of to-day deliberately elect to take the fastest steamer, assuming the chances of collision or any other possible form of disaster. And this they are encouraged to do by the small ratio of fatalities on the ocean highway compared with those which overtake travelers by rail or other modes of conveyance.

The lamentable fate of the Geiser seems to enforce at least one obvious truth—namely, that safety at sea depends on skillful navigation, the vigilant use of signals and the sounding lead, rather than on further improved mechanical appliances of any kind whatever. The resources of human ingenuity in this direction seem to be well-nigh exhausted. The subject of "ocean steam losses," however, has hardly received the attention which the safety of travelers demands. The strict observance of certain limits in defining the course of steamers on their outward and homeward trips respectively would do much to lessen the perils of ocean travel.

A Mexican letter says, there is much more attention given to agriculture in that country, and that large importations of American agricultural machinery are being made, as it is found that the Americans make lighter and stronger machinery than the English.

MANUFACTURE OF ALUMINIUM.**THE CASTNER PROCESS IN OPERATION.**

The English technical newspapers contain accounts of a visit made lately by a party of scientists to the new works of the Aluminium Company, Limited, at Oldham, where new works have been built for the production of aluminium by the process of H. Y. Castner, a New York chemist. The works are in close proximity to the Oldbury Station of the Great Western Railway, and contiguous to Messrs. Chance Brothers' alkali works, from which an important part of the raw materials employed in the manufacture—namely, caustic soda and hydrochloric acid, are derived. The processes included in the manufacture are the production of sodium by Castner's method, of the double chloride of sodium and aluminium, and the reduction of aluminium from the latter salt by the action of sodium. The first of these, which is in many ways the most interesting of the different operations, is effected by the action of a very intimate mixture of carbon and iron obtained by coking a mixture of pitch and finely divided iron upon melted caustic soda at a strong red heat. The operation is performed in large cast-steel crucibles, attached to the head of a hydraulic plunger, which are pressed against a fixed arc and delivery pipe, the whole arrangement forming a kind of still which is heated by gas from a Wilson producer running with heated air. The active reducing agent is carbon, the purpose of the iron being merely to ballast the carbon and prevent it floating to the surface of the molten alkali. About one-third of the latter is reduced, and distils over into a tubular receiver connected with a cylindrical pot filled with naphtha, which receives the condensed melted sodium. The remainder of the alkali becomes carbonized, and the receivers, when cooled, are lixiviated in a tank, giving a solution of carbonate of soda, which is pumped back to the alkali works to be reconverted into caustic.

The pots now used are about 18 inches in diameter, 2 feet high, and contain about 80 pounds of materials. When the distillation is completed the pot is removed from its seat, drawn by a pair of tongs on a bogie to the discharging pit and emptied, a fresh charge being added without allowing it to cool. In this way, and by subjecting the materials to a preliminary heating before charging, the time of one operation has been reduced from two and a half to one and a half hours. A maximum quantity of 14 pounds of sodium may be obtained by one operation, and the capacity of the four furnaces, each having five reducing pots, is about 1500 pounds of sodium per day. The sodium when collected is melted in heated petroleum, and cast into rectangular bars about a foot long, a form which is convenient for packing in petroleum tins. When required for export the tin filled with petroleum and sealed is placed within a new tin partly filled with lime and petroleum, which apparently protects the metal in the inner tin from oxidation. The next operation, the preparation of aluminium chloride, is performed by the slow action of gaseous chlorine upon a mixture of alumina and carbon placed in a retort and strongly heated. The alumina obtained, as nearly pure as possible, is thoroughly incorporated with the carbon in the form of lamp-black by drying and molding the mixture in a small drain-pipe machine. The chloridizing furnaces resemble small open-hearth regenerative steel furnaces, each one having five D-shape clay retorts on the bed which are charged from one end and are connected with a condenser at the other, the charging side being also provided with a chlorine feed tube. The

chlorine is made in stone stills in the usual manner from manganese ore and hydrochloric acid, the latter being laid on by a main from Messrs. Chance's works. Originally the gas was delivered directly from the stills to the retorts, but owing to an explosion from some irregularity in the working of the latter it is now stored in gasometers, and the supply to each retort is controlled by a delicate hydraulic regulator, which can be adjusted by simply turning a cock to deliver the gas in quantities varying from about 50 pounds to 300 pounds in 24 hours.

The charge of the retort requires from two to three days to work it off, and the working capacity of the 12 furnaces is about 6000 pounds per day. The mixed double chloride of sodium and aluminium, containing about 12 per cent. of the latter metal, is finally reduced by heating it with sodium and cryolite, 80 pounds of the double chloride, 26 pounds of sodium, and 30 pounds of cryolite, ground to a fine powder, giving 8 pounds of metallic aluminium, which contains about 98 per cent. of the pure metal, the rest being mainly iron and silicon. The reducing plant is still to some extent in the experimental stage; a small reverberatory furnace with a bed made of alumina and fire-clay having been tried in conjunction with two forms of crucible furnaces, the latter being so arranged that the melted metal as it forms may fall through a hole in the bottom into a collecting pot placed below. No one of these forms of apparatus has yet been decisively adopted; but the experiment seems to show that some form of crucible furnace working continually is likely to be most advantageous. When fully at work, the producing capacity for aluminium will be about 500 pounds daily, at about 15/ per pound, and 9d. per pound for sodium. The company, in addition to the pure metal, produces all the varieties of copper alloys known as aluminium bronzes, with from 2½ to 10 per cent. of aluminium, and a 15 per cent. alloy with iron for a base in the production of soft iron castings.

Iowa Shippers Up in Arms.

A meeting of jobbers and manufacturers of Iowa cities was held at Davenport, Iowa, on the 14th inst., for the purpose of sustaining the Iowa Commissioners in the railroad rates they have proclaimed, and obtaining relief from alleged discriminations made by the roads against the shippers of the State. Representatives to the number of more than 100 were present from Davenport, Dubuque, Clinton, Muscatine, Burlington, Ottumwa, Des Moines and Keokuk. W. H. Torbert, of Dubuque, was chosen chairman. He said the great interests of the State were struggling for the right to live. There is no disposition, he affirmed, to ruin the railroads, but firmness would be insisted on.

Governor Larrabee was introduced and received with applause. The Governor presented his well-known views at some length, and gave his experience as a manufacturer and shipper, he being the owner of a large flouring mill. He said the business men had assembled "to protest against the wrongs that are inflicted by the railroads upon the jobbers, manufacturers and farmers of Iowa, and to formulate plans for united action. Railroad managers, by denying that abuses exist, seek to impeach the testimony of three-fourths of the people." The Governor reviewed the history of railroad legislation.

Fred. Wild, an old railroad manager, now engaged as secretary of the local shippers' association, gave tariff statistics and percentage comparisons from many points to others inside and outside of the State, showing how business is oppressed by existing schedule rates. The Hon. Jones T.

Lane gave a legal view of the case. Mr. Lane is the counsel of the railroad commissioners. He says the railroads have not raised a single point they will dare carry to the Supreme Court of the United States. Their hue and cry was but a conspiracy to throw dust in the eyes of the people of Iowa.

Robert Donahue, of Burlington, also addressed the meeting. A committee on organization was formed, composed of Fred. Wild, of Davenport; Robert Donahue, of Burlington; W. Lange, of Dubuque, and J. R. Baldwin, of Clinton. An evening session was held, but it was of a strictly private character. The reported object was the formulation of plans for a legal contest.

Corporation Wrecking.

Railroad wreckers were roughly handled in a decision rendered in Chicago last week by Judge Tuley in the case of the Smith Bridge Company vs. Henry Crawford. The plaintiffs claimed that in 1882 they constructed two bridges over the Wabash River for the Chicago and Great Southern Railroad, under contract, for \$21,000; that Mr. Crawford, who undertook to build the road, did so under a construction contract, having claimed that he had no interest in the company, whereas, in fact, he owned \$2,400,000 of the stock. It was further claimed that this construction contract was made through a dummy board of directors, the contract being made to himself; that as soon as the contract was completed he caused a mortgage he held on the railroad to be foreclosed and a receiver for the entire assets appointed. The old company being thus burst up, a new company was created. In this way every creditor of the old company, including the complainants in the present suit, were left without any means of satisfying their claims. "The time has come," said the Judge, "when the courts must rise equal to the emergency that is now upon them, equal to the changed conditions and methods of transacting the affairs of corporations, and hold that the manipulators of corporations do not lose their identity because they hide behind corporate forms and proceedings. Trusts, heretofore unknown to the law, are formed to manipulate corporations, by which the people are oppressed and the powers of the State defied. Corporation wrecking has become an established practice, and parties even use the forms of a court of equity for that purpose. Advanced ground must be taken, and these manipulators of corporations, whether 'trustees' or 'wreckers,' must be held personally accountable for corporate assets which get into their possession and for all profits made by their manipulations in their private interests of corporate property or corporate franchises. The courts must in such cases apply the rule which courts of equity apply in all other transactions and deal with the real party, the moving party, the real actor, and will grasp the substance without regard to the obscuring forms under which it may be hidden."

At the last meeting of the Quebrada Railway, Land and Copper Company, the concern operating copper mines in Venezuela, the chairman stated that under their contract with the Société des Métaux the company are guaranteed £70 per ton of best selected, the production being limited to 12,960 tons of copper, as its equivalent, for three years. During the course of his remarks the chairman said: "The producers of copper may find it wiser to limit their production of copper in the future to such quantities as they can sell at a reasonable profit than to go on producing larger quantities at a loss and exhausting their mines into the bargain."

English Capital at Cumberland Gap.

The American Association, Limited, with headquarters at Knoxville, Tenn., is an English syndicate, composed of the following directors: E. A. Pontifex, president, who is also president of the Cape Copper Mining Company, of London; Dilwin Parrish, who is also president of the London Telephone Company; Thomas Brooks, of Manchester, coal master and banker; Thomas Ashton, banker and manufacturer; N. Story Maskeylyne, M. P. and, Jacob Higson, of the Ebbwvale Steel Company. Mr. Higson, who has other large interests in England, is a man of great experience, and has directed a great deal of foreign money to this country. Clarence Carg, of New York, is another director. Several large stockholders are heavy coal operators in Great Britain. The general manager of the company is Mr. Alex A. Arthur, at Knoxville, Tenn. The syndicate owns Cumberland Gap and 60,000 acres of mineral lands adjoining, lying in the States of Kentucky, Virginia and Tennessee. These three States corner in on the top of the Gap. This region of country has for a long time been known to be underlaid with deposits of iron ore and coal, but being inaccessible to markets the lands were of little value. Recent geological surveys and publications by the State of Kentucky caused foreign capitalists to make investigations, which has resulted in large investments in Eastern Kentucky coal fields. The company is now tunneling Cumberland Gap, and will open it to all railroads. The Louisville and Nashville Railroad is now building an extension from Pineville, and will connect with a new road from Atlanta. Two other roads are approaching this point to make connection, and five additional lines are negotiating for the right to run through the tunnel. Claims to have Oriskany ore running 58 per cent. metallic iron with only trace of phosphorus; red fossiliferous ore in abundance, with 58 per cent. iron; a carbonate iron, with 44 per cent. of iron and low in phosphorus; argillaceous ore, with 47 per cent. of iron and manganiferous ore, running 30 per cent. manganese and 10 per cent. iron. Besides, the Company own Bessemer ore lands in the Allegheny range. It is claimed that an abundance of fine lime rock lies easy of access. The coal deposits are perhaps more bountiful than the ore. Near the Gap there are from 8 to 14 seams, all within reach, among them three beds of Cannel and three beds of coking coal. These coals have been thoroughly tested both in this country and across the water. The Cannel coal of Eastern Kentucky has long been highly valued for gas producing as well as for fuel. Mr. Arthur claims that they will be able to produce steel very cheaply. The company have selected a level valley in which to locate a town, and will call it Middlesboro', after the great manufacturing center of England by that name. Several coal leases have already been let out by the company, and they are now arranging for the first of their furnaces to be put up at once. Including the men at work on the approaching extensions of the railroad, another at work opening up the mines, there are over 5000 laborers in the vicinity, pushing forward this large enterprise.

The Pittsburgh Suspension Bridge.

—The Sixth Street suspension bridge across the Ohio River connecting the cities of Pittsburgh and Allegheny is now being inspected in a very thorough and exhaustive manner. The bridge was built in 1856 by John A. Roebling, and was the second of the kind in the country, the first having just been completed at Niagara. The present inspection is under the direction of John A. Roebling, Jr., of New York, and Engineer W. Hilderbrand is in charge of

the work. The anchorage of the bridge, by its cables, was considered wonderful when it was built. Eight long links of chain go down into the ground in semicircular form at the ends of the bridge, and to these the cables are attached. At the end of each of the four chains is a heavy cast-iron plate weighing five tons, which is imbedded near the bottom of a mass of solid masonry 35 feet long and 25 feet deep. This masonry has been opened for examination and is in first-class condition. The cables and chains, which were surrounded with tar, have not corroded, but paraffine is being substituted for the tar, and the rest of the wall filled up with big cut stones cemented together. The caps have also been taken off the towers, and

tained by electrolytic methods. It is noted that the iron mirror rotates the plane of polarization, the direction of which varies with the direction of the electric current.

New Single-Action Arch Press.

We present in the accompanying engravings a general view and details of one of the latest designs of single-action presses put upon the market by the E. W. Bliss Company, of Brooklyn, N. Y. It is specially adapted for operating sub-presses in the manufacture of watch movements and other small work requiring considerable power and great accuracy. It may also be used in ordinary cutting, punching

Fig. 1.—General View.

NEW ARCH PRESS, BUILT BY THE E. W. BLISS CO., BROOKLYN, N. Y.

all the wires of the cables are being carefully inspected by Mr. Hilderbrand. There is not the slightest break in those so far inspected. The bridge and its anchorage are practically in as good condition as when it was built.

A transparent deposit of platinum can be obtained by covering the bottom of a glass dish with a mixture of platinum chloride and glycerol; this is evaporated to dryness, and finally washed with alcohol to remove the product of decomposition of the glycerol. The metallic deposit is perfectly transparent, the transmitted light being of a dark blue-grey tint. The commercial method of producing platinum mirrors by reducing the chloride with essence of lavender and heating the containing vessel up to the temperature at which the glass softens does not yield a sufficient cohesive product. Transparent layers of platinum and mirror deposits of iron, nickel and cobalt, can also be ob-

and forming operations within the range of its capacity. The press frame is of the ordinary arch pattern, and the slide is provided with adjustable V-shaped gibbs to take up wear and keep slide working true. The special feature of the press is in the slide, which is made in two parts and connected with a steel wedge-shaped adjustment, making a practically solid mass of metal between the crankshaft and face of slide, which is especially desirable for heavy or very accurate work.

The details of this wedge adjustment are shown in Figs. 2 and 3. The mandrel is made in two parts, and a wedge, W, is fitted between these, being operated by means of a screw, S, and handwheel and engaging the slides P R. The height of the mandrel from the bed can thus be accurately adjusted. A powerful clutching device is used to connect the wheel to the shaft.

This press is designated as No. 51, and its general dimensions are as follows: Width between uprights, 12½ inches; open-

ing in bed as desired; motion of slide from $\frac{1}{4}$ to 4 inches, according to the work; adjustment of slide, $\frac{1}{8}$ inch; balance wheel, 34 inches diameter, $4\frac{1}{4}$ inches face, weight 400 pounds. Total weight of press, 1400 pounds.

Recent Treasury Decisions.

The Secretary of the Treasury has promulgated the following decisions *in extenso*, affecting the customs duties on metals:

LOCOMOTIVE CRANK-PIN TURNINGS.

On an appeal from an assessment of duty at the rate of $2\frac{1}{4}$ cents per pound on certain iron locomotive crank-pin forgings claimed to be dutiable at the rate of 2 cents per pound for "forgings of iron and steel for vessels, steam engines and locomotives, or parts thereof, weighing each 25 pounds or more," the Department revokes the assessment. The question involved in this case is whether the term "forgings of iron and steel" used in said

Bessemer steel slabs or cakes, which are intended for use in the manufacture of finished steel plates, sheets or bars, is held to be dutiable at the rate of 45 per cent. ad valorem for "steel ingots * * * and slabs, by whatever process made, * * * valued at 4 cents per pound or less."

DUTY ON COPPER IN SILVER ORE.

The Treasury Department affirms a decision of the collector at El Paso, Texas, assessing duty at the rate of $2\frac{1}{4}$ cents per pound on the copper contained in certain so-called silver, and entered free of duty as silver ore. The appellant claims that, inasmuch as the ore contains less than 5 per cent. of copper, and as there are no smelting works in the United States which will pay for copper contained in any ore unless the amount should exceed 5 per cent., the ore in question is strictly a free or silver ore. He further claims that the percentage of copper found—viz., $\frac{1}{8}$ per cent.—in said ore, having been ascertained by the wet or volumetric method, is excessive,

of a large grain elevator at the same time in the same city gives color to the theory that the fires were of incendiary origin. All were covered by insurance.

The Oscillations of High Chimneys.

—In the *Mémoires de la Société des Ingénieurs civils* particulars are given of the oscillations of a chimney stack near Marseilles, 25 m. (115 feet) high, with an exterior diameter at the top of 1.22 m. (4 feet). During a severe storm it was determined, by observing the shadow of the chimney, that its greatest oscillation was half a meter (nearly 1 foot 8 inches). It was further observed that a chimney set in motion by a gust of wind oscillates from four to five times backward and forward until it is at rest again. M. E. Burgh asserts that should this momentum during the oscillations of a chimney repeat itself in such a manner that its direction coincides with that of the oscillation, the overthrow of the chimney may be expected. This is the explanation given for the destruction of many a chimney constructed in accordance with sound principles of stability. The *Oesterreichische Zeitschrift für Bergund Hüttenwesen* adds to this statement the qualification that, in the case of a chimney near Vienna, 50 m. (164 feet) high, and constructed of concentric (hollow) rings, with an inner diameter at the top of 2 m. (6 $\frac{1}{2}$ feet), which is exposed to considerable gusts of wind, the oscillations were most carefully and repeatedly measured with a theodolite, when the observations showed an extreme oscillation of only 16 cm. (6 $\frac{1}{4}$ inches) during severe storms.

The American Well Works, of Aurora, Ill., have issued a 48-page illustrated "Treatise on Natural Gas and Oil," with illustrations and descriptions of tools and appliances. Several pages of interesting information are given regarding the discovery and properties of natural gas, together with the theories of its origin. These are followed by a full catalogue of boring appliances, including portable steam engines, artesian well rigs, oil well tools, the Hercules steam drill, hydraulic mounted revolving machines, horse-power revolving rigs, Chapman's revolving process and patent force expansion drills, hydraulic and jetting machine, pipes, fittings, &c.

Contracts for nearly 7000 tons of cast-iron water-pipe were placed by the city authorities of Chicago on the 16th ult. Six-inch pipe will be furnished by the Addyston Pipe and Steel Company, of Cincinnati, at \$24.85 per ton. All other sizes will be supplied by R. D. Wood & Co., of Philadelphia, at the following rates: Eight-inch, \$24.84 per ton; 12-inch, \$24.70 per ton; 16-inch, \$24.60 per ton; 24-inch \$24.40 per ton. These prices are stated to be at least \$3 per ton lower than the prices at which similar contracts were placed last year.

Representative Thomas, of Illinois, a member of the House Committee on Naval Affairs, has prepared an original design for a war vessel, which will be laid before the committee. The vessel is to be known as the pneumatic dynamite monitor. The estimated cost of the vessel is \$1,500,000.

Sheffield, like Manchester, wants a canal to the sea, and can have it by expending \$5,000,000 on a trench 50 miles long. A Sheffield paper says: "We have lost steel rails and ship-plates. There remain tires, wheels, axles and springs; armor plates, gun forgings, propeller blades, cranks and those mighty castings which require to be tugged by traction engines, for, if they go by rail, they want more room than Royalty itself."

Figs. 2 and 3.—Details of Wedge Adjustment.

NEW ARCH PRESS, BUILT BY THE E. W. BLISS CO., BROOKLYN, N. Y.

provision of law covers only forgings of the two metals combined or both forgings of iron and forgings of steel, and the proper rate of duty on the forgings in question, which are composed of iron alone is dependent on its solution. This question has been submitted to the Attorney-General, who under date of the 2d inst., reports that, in his opinion, the phrase "forgings of iron and steel" in said provision of law, and also in T. I., 167, which imposes a duty of $2\frac{1}{4}$ cents per pound on "forgings of iron and steel, or forged iron, of whatever shape or in whatever stage of manufacture," should be interpreted to include forgings of iron and also forgings of steel, and not alone those in which the two metals are combined in the same forgings. The Department accepts the opinion of the Attorney-General as to the proper interpretation of said provision of law, and you are hereby authorized to readjust the entry in accordance therewith, and to take measures for refunding the excess of duty. This decision revokes the Department's decision of May 16 last, in which the contrary view was held as to certain forgings of steel.

DUTY ON "REMELTING STEEL."

An article called "remelting steel," which upon further investigation was found to consist of the best quality of

and that the dutiable percentage of copper, if any, should have been ascertained by the dry or fire assay. The decision as to the liability of said copper to duty, being in accordance with T. I., 186, and the Department's decision of November 21, 1887, is affirmed. It appearing from the report that the method which was used in the ascertainment of the percentage of said copper is more accurate than that claimed by the appellant, the decision is also affirmed as to the quantity of dutiable copper found.

The lowest bidder for a new fireboat for the protection of the harbor of Boston was found to be Charles F. Elmes, of Chicago, when the bids were opened last week. Unfortunately his bid, though the lowest, was \$2000 above the limit allowed by the appropriation, and new bids were called for. He has again entered the lists determined to carry off the contract. He built the engines for the fireboats used in Chicago, which have proved very satisfactory.

On the 14th inst. two large agricultural implement warehouses at Peoria, Ill., with all their contents, were destroyed by fire. One belonged to Martin & Co. and the other to Kingman & Co. The destruction

THE WEEK.

The American Meat Company, just organized with their headquarters at Kansas City, Mo., are probably the most extensive company of the kind in the United States. The company have over 4,000,000 acres of land in Mexico and New Mexico, upon which they have at the present time 425,000 head of cattle. This large body of land is owned by the company in fee simple, and the company propose to go into the cattle-raising business on the widest scale. The cattle will be shipped to Kansas City, where they will be slaughtered in the large house erected for that purpose. J. H. Flagler, of Pittsburgh, through his connection with the McKeesport Tube Works, is president.

According to experiments conducted by the Health Board of New York, it appears that dry heat of even 280° is insufficient to kill disease germs, except in cases where the fabric is perfectly dry or so loosely rolled or folded that the heat can penetrate it. But by injecting live steam into the tank Dr. Edson's assistants have been able to disinfect clothing and bedding at a temperature of about 160°, and the goods come out of the tank unhurt, except that the colors in some kinds of cloth are effaced or badly mixed. The disinfection by steam is rapid and satisfactory. Iron cages are being prepared for the collection and return of bedding and clothing. Each cage has a lock to it, and the owners of clothing can keep the key while the goods are being disinfected. The work is done by the Health Department free of charge.

The labor unions of New South Wales are the ruling power. The American steamship Alameda, of the Oceanic Steamship Company, arrived at Sydney from San Francisco last month, having on board 33 Chinamen employed in the menial positions, such as shovellers and trimmers, which no American coveted. Otherwise, from the captain down, including waiters, engineers and porters, all were Americans. The amalgamated labor unions of New South Wales resolved that the Chinese must go, and accordingly the steamship officers were notified that unless the obnoxious Celestials were discharged the vessel would not be allowed to dock, land her cargo or to take new supplies of coal. While the Government authorities had under consideration measures intended for her relief, the captain so far weak ned that an agreement was signed to receive on board as passengers 21 members of the seaman's union who would supersede the Chinamen on arriving at San Francisco. All other lines converging at Sydney, report said, would be similarly purged. A Sydney correspondent says: "The laboring man is the real ruler of New South Wales, and dictates terms and conditions which suit himself and which are unquestioningly acceded to. Wages here are three times what they are in London, and yet the laboring man considers himself downtrodden, and continually makes new demands." The more thoughtful of the people deprecate the unreason of the wholesale denunciation of the Chinese, and apprehend grave complications with the Chinese Government unless more consideration and moderation are exercised.

Seventeen deadly bombs of the anarchist pattern were found in the scrap-iron pile of the Swift Iron and Steel Works, near Cincinnati, where it had been gathered from various sources.

According to the new rule just enforced at all the ports of the Island of Cuba, navigation duties have been suppressed for all vessels belonging to the nations with whom Spain has a commercial treaty, and in their stead a duty of \$1 for each ton of goods

landed and shipped has been established. This measure considerably increases the expenses on all goods imported and exported, as will be seen hereafter. A steamer measuring 1760 tons can load 3000 tons of goods, and will pay; on goods imported, \$3000; on goods exported, \$3000 to \$6000. Same steamer paid before, 6½ cents for each ton of measurement, \$1100. Difference, \$4900 more now than before.

Costa Rica has taken the initial step toward carrying into practical effect the project of a Central American confederation by decreeing that henceforth all citizens of Guatemala, Salvador, Nicaragua and Honduras shall enjoy all the rights and privileges of her own citizens when within her boundaries.

The value of imports of fruits, including coconuts, from the West Indies into the United States for the year ending June 30, 1888, was \$5,806,687.

The deficiency in the French wheat crop has already lead to unusually heavy purchases of wheat on the Pacific coast for direct export to France.

The first tea ship from China this season made the trip to New York in 65 days.

The Barings and other well-known houses will issue in October the stock of a company with a capital of £10,000,000, formed to work a concession to supply Buenos Ayres with water.

Duties are collected on merchandise arriving from Mexico by parcels post in accordance with a convention, which went into force July 1.

The firing of Cannon in Jacksonville as a protection from yellow fever is ridiculed by the New Orleans *Times-Democrat*. The editor says: "The concussion theory is as absurd as it is old. It was tried half a century ago in the Gulf cities, and its only effect was to kill by the shock nearly all the convalescents. The Jacksonville authorities have, it is true, warned the people of the salute and advised them not to be frightened over it, but this advice cannot always be followed by persons sick of the fever, and the cannonade is only too likely to be followed by an increased death rate, without the slightest good resulting from it. And it will undoubtedly have the effect of still further increasing the panic, as in an infected town nothing tends more to spread the gloom and feeling of terror than to have the sky overclouded with smoke and the minute guns steadily firing. If this does not cause the bravest Jacksonvillian to lose his nerves, nothing will."

At the meeting of the executive committee of the American Protective Tariff League, Stephen W. Roach, of New York, was elected manager in place of Garrett Roach, deceased, and ex-Governor Hoyt, of Pennsylvania, was elected general secretary of the League, in place of Joseph D. Weeks, resigned.

A tract of 110,000 acres of coal lands in Colorado, 60 miles north of Pueblo, is said to have been bought by a number of Pennsylvania capitalists for \$3,850,000. Some of the coal veins are 12 feet thick.

An invention to regulate combustion and to prevent sparks from locomotives has been patented by Robert H. Coleman, the ironmaster, of Lebanon, Pa. Report says that its value has been proven in practical tests.

Peru is suffering severely from the sudden collapse of paper money circulation. It is estimated that 60,000,000 paper sols guaranteed by the Government remain in private hands, and is practically useless, so that numbers of families in Lima and other principal cities are unable to buy the necessities of life. Consul Brent, in describing the situation, which he regarded as

almost hopeless, says: "Such a blow to a nation in such financial straits as Peru is to-day is hardly conceivable abroad."

Rumors come both from Ottawa and an agent of the New Zealand Government now in San Francisco that negotiations are pending between the Australian colonies and the Canadian Pacific Railway for a line of mail steamers to Vancouver and Brisbane on the termination of direct service via San Francisco next October. Should a contract be made, which seems not improbable, the bulk of American correspondence would go through the Dominion.

The coroners jury sitting in the case of the Chrystie street fire, by which a number of persons lost their lives, find that the building law requiring fire-escapes is inadequate in their application to factories where large numbers of working people are engaged, and recommend such revision as shall afford the needed protection.

The Manhattan Club offered a round \$800,000 for the Stewart mansion, without securing the property.

Austin Corbin has resorted to legal measures for the suppression of foul odors on Barren Island, where the city refuse is converted into fertilizers. He claims to have suffered to the extent of \$100,000.

The acting superintendent of the Maritime Exchange, in speaking of the sinking of the ocean steamship Geiser by the collision with the Thingvalla off the coast of Nova Scotia, said: "It seems almost impossible to prevent such accidents at sea, unless the masters of vessels adopt the plan of running very slow when the weather is thick. Captains are usually anxious to make good time." The ocean lane system, the acting superintendent thought, might be to a certain extent effectual, but people who go to sea should make up their minds that there are risks which they must assume.

There is no yellow fever in any part of Florida, excepting Jacksonville, Tampa and Manatee, and it is believed that it is not now epidemic anywhere. In Jacksonville last week the victims of yellow fever numbered only three.

The materials for the repair of the damaged steamship Thingvalla, at Halifax, will be forwarded from New York and Philadelphia.

Gen. J. L. Curtis, who has been nominated for President by the American party, is President of the Franklin Steel and Zinc Company, of New Jersey, and is interested in other steel and zinc projects.

There is talk at Detroit about the possibility of the Canadian Pacific Railroad making that city one of the principal points of connection with the United States railroad system by means of a tunnel.

The rising port of Tacoma, the center of a great wheat and lumbering region, will this year ship 80 cargoes of wheat, mostly from the Palouse country, in Eastern Washington Territory.

The President of the American Paper Makers' Association has collected reliable data showing that the paper trade which stood 21st in rank among American manufactures in 1880, is now 14th, and that the capital invested has nearly doubled in the last eight years. The annual product has far more than doubled in quantity, and in spite of lower prices is 75 per cent. greater in value. The number of employees is 40,000, against 24,500 in 1880, and the wages paid are more than twice the total in the last census year. The average per day for each worker was then \$1.13, and now it is \$1.50.

George N. Tatham died early Sunday morning at Jenkinstown, Pa., where he was spending the summer. He had been

ill for a long time. Mr. Tatham was born in Philadelphia in 1807, and had been for many years the senior member of the firm of Tatham Brothers, manufacturers of lead pipe. Henry B. and William P. Tatham, in Philadelphia, and Charles, another brother, in business in New York, survive.

So great are the improvements made in Germany in the navigation of rivers and canals that the total tonnage of the German river fleet is only a trifle under that of her whole merchant navy, being, according to the returns for 1885, 1,242,000 tons, against 1,294,000. A good idea of the part played by river navigation in the internal commerce of Germany may be gained from observing the relative proportion of land and water freight in the commercial returns of some of the leading cities. The following table comprises some of the more striking instances:

	Tons received—	
	By rail.	By water.
Berlin.....	3,504,000	3,348,000
Hamburg.....	1,191,000	3,221,000
Bremen.....	776,000	184,000
Mannheim and Ludwigshafen.....	1,778,000	2,041,000
Ruhrort, Duisberg and Hochfeld (ports of the Rhine).....	5,427,000	4,107,000

In the cases of Hamburg and Bremen sea tonnage is, of course, excluded.

The new twin-screw steamer of the Inman Line, the City of New York, and the Cunard Line's second-best boat, the Umbria, steamed down the bay on Saturday within an hour of each other, bound over a course 2850 marine miles long, for Queenstown. It is positively affirmed that they will not race, but it is just possible, as somebody has remarked, that they "will endeavor in a humble way to see which will get there first."

It is estimated that the city of Brooklyn will this year have a population of 800,000, and that five years hence there will be fully 1,000,000 people within the present boundaries.

By the death of Charles Crocker San Francisco loses a citizen whose property was worth \$40,000,000.

New York's Future.—The future of New York City is outlined by Andrew H. Green, ex-Comptroller and ex-Park Commissioner, whose offices contributed largely to the laying out of Central Park. He predicts the eventual absorption within the corporation limits of the town of Westchester, of the whole of Kings County, of Flushing, Newtown and Jamaica, in Queens County, and all of Staten Island, giving to the city an area of about 320 square miles, as compared with London with an area of 687 square miles. To effect this object Mr. Green would remove all obstacles, open ways, build bridges and make it cheap and convenient for anybody to live here. He says: "From the easternmost point of Staten Island to the northerly line of the city, being the southerly line of Yonkers, would be 32 miles. From the Battery to its extreme northerly line would be, say, 18 miles, and from the Hudson River to the easterly line of Flushing would be about 7½ miles. We cannot keep too constantly in mind that New York is and is to be the great manufacturing center of the continent. Its domestic is probably three times its foreign commerce. No impediment should be placed in the way of conveniences for continuing our hold on the great continental traffic which by all the rights of topographical advantages belongs here. The Hudson should be bridged, of course avoiding needless obstructions to the waterway. The great continental railway lines must be facilitated in establishing their terminals here. Where capitalists are willing to embark their money to open new ways to the city, to bridging and tunnel-

ing the adjacent waters, they should be encouraged, not opposed by vexatious legislation. Within a radius of 25 miles from the Battery in Jersey there are more people to-day than in Brooklyn, more than the whole State of Connecticut, and the day is not distant when the necessities of business and the convenience of administration will force a concentration of the various towns, cities and villages within this radius into one great municipality, with immense advantages for the accommodation of domestic traffic, and with excellent water facilities."

The World's Fast War Ships.

An interesting and valuable collection of statistics has just been laid before Congress, comprising the principal war vessels of all navies, classified according to speed. According to these, England has four armored and half a dozen unarmored cruisers that make 15 knots. Her armored 16-knot vessels include the Imperieuse and Warspite, of 8400 tons each; the Collingwood of 9500, the Rodney of 10,300, the Camperdown, Benbow, Anson and Howe of 10,600 each. She has building the Victoria and Sans Pareil of 10,470 tons each, and the Trafalgar and Nile of 11,940. Her six unarmored cruisers going 16 knots include four of the Leander class, 3750 tons each, while four more of the Blanche class, 1580 tons, are building. Passing to unarmored vessels of 17 knots, England has eight of the Archer class, 1770 tons, on which our gunboats of the Yorktown class are modeled. She has also the Surprise and Alacrité, 1400 tons; four vessels of the Mersey class, 4050, and the Polyphemus, 2640. Of British 18-knot vessels, the most remarkable are the armored Orlando, Undaunted, Australia, Narcissus, Galatea, Immortalité and Aurora of 5600 tons each, all but the two latter already built. The same high speed is ascribed to the well-known unarmored vessels, Iris and Mercury, 3730 tons, and to four small craft of the Grasshopper class, 525 tons. Great Britain's 19-knot vessels now building are the unarmored cruisers Melpomene, Magicienne and Marathon, 2950 tons, and the Barham and Bellona, 1800. Of 20-knot vessels, she has building the Medea and Medusa, 2800 tons; the Vulcan, 6620, and the Blake and Blenheim, 9000, besides seven small vessels of 735 tons. France has no fewer than four armored and 13 unarmored vessels of 15 knots. She has of 16 knots the armored Courbet built and the powerful Hoche, Magenta and Neptune, 10,581 tons each, now building. The unarmored Tourville and Duguesne are also 16-knot cruisers. Of 17 knots the most important vessel is the Sfax, 4480 tons, while there are four more unarmored cruisers of the Faucon class, about 1272 tons. In the 18-knot array we find the two most powerful vessels in the French navy, the armored Marceau of 10,581 tons and Brennus of 11,000. Then there is the swift unarmored Milan of 1550 tons, besides eight torpedo boats of the Bombe class, 321 tons. France of 19-knot unarmored vessels has the Forbin, 1848 tons, already built, and five others of the same class building. She has also under construction the Jean Bart, Alger and Isly of 4162 tons, the Cécille of 5766, and the Tage of 7045. She claims 20 knots for the armored vessel Dupuy de Lôme, 6297 tons, and also for the unarmored Davaust and Suchet, 3027 tons, all now building.

Italy has two big armor clads, the Duilio and Dandolo, of 15 knots, and half a dozen unarmored cruisers. She has three powerful armored vessels, the Andrea Doria, Ruggiero di Lauria, and Francesco Morisini, of 10,045 tons each, besides two unarmored cruisers, all going 16 knots. Of her three 17-knot vessels the most important is the unarmored

Giovanni Bausan, 3068 tons. But it is in her 18-knot vessels that Italy is incomparable, since these include the powerful armor clads Italia, 13,898 tons, and Lepanto, 13,550, already built, and the Re Umberto, Sicilia, and Sardegna, 14,000 tons, building, besides four small unarmored vessels. Her 19-knot unarmored cruisers are four of the Vesuvio type, 3530 tons, and five of the Dogali, 2200 tons, three of these nine vessels being already built. Finally, of small 20-knot torpedo craft she has nine of the Tripoli type, 741 tons, and six of the Folgore, 317 tons.

Germany has one gunboat built and half a dozen building of 15 knots. She has also the unarmored cruisers Prinz Adalbert and Leipzig, 3925 tons; the Alexandrine and Arcona, 2370 tons; the Charlotta, 3360 tons; the Freya, 2017. Of 16-knot vessels she has the unarmored Hohenzollern, 1700 tons; the Pfeil and Blitz, 1382 tons; the Ziethen, 975. She has no vessels of 17 knots, but she has under construction the Wacht of 1240 tons, which is expected to go 19 knots, and the Grief of 2000, for which 20 knots are promised. She has also three unarmored vessels building, the Irene, Princess Wilhelm, and one other, of 4400 tons each, which are to make 18 knots.

Spain has an armor clad, the Pelayo, of 9902 tons, which makes 15 knots, besides two unarmored cruisers of 3342 tons each, two others of 1152 tons, two of 1030, and four of 1055. She has none classed as 16, and none as 18-knot vessels; but of 17-knot unarmored cruisers she has the Arragon of 3342 tons, and the Reina Cristina, the Reina Mercedes, and the Alfonso XII, each of 3090. Spain is becoming famous for fast war vessels, and has under construction no fewer than six armored 19-knot cruisers of 7000 tons each, a little larger than our own Maine and Texas, of which only 17 are expected. She has also already built the famous unarmored Reina Regente of 5600 tons, making 20 knots, the fastest vessel of her class in the world. This cruiser may be practically the model for the new 20-knot unarmored vessel of 5300 tons displacement provided for in the pending House Naval Appropriation bill. Spain has also the Destructor, of 458 tons, a 20-knot vessel, and both of the Reina Regente and of the 20-knot torpedo types she is building three more vessels each.

Russia has one armored and three unarmored vessels of 15 knots, and is building three armored vessels, the Tchesma, Sinope, and Catherine II, of 10,181 tons each, to go 16 knots. She also has five middle-class ironclads, the Dmitri Donskoi, of 17 knots, and the Admiral Nachimoff, Alexander II, Nicholas I, and Pamjat Azova of 18 knots. She has an unarmored cruiser of 19 knots, the Admiral Korniloff, and two small craft of 20 knots. Brazil has her famous Riachuelo of 16 knots and Aquidaban of 15, besides the unarmored Almirante Tamandaré of 17 knots. Chili has the renowned Esmeralda of 18 knots, and a larger vessel building of 19 knots. Austria has one armored vessel of 16 knots and one of 17, besides two unarmored cruisers of 19 knots and one of 18, with three small torpedo boats of 20. China's armored vessels include one of 15, two of 16, and one of 17 knots, while she has four unarmored cruisers of 15, four of 16, and two of 18 knots. Japan has three armor clads, the Itsukushima, Matsukushima, and Haki-dati, 4140 tons each, of 16 knots, and an unarmored cruiser of the same speed, and she has three vessels of the famous Naniwa type, 3650 tons, and 18 knots.

Mr. James Skelding, manager of the Low Moor furnaces, at Low Moor, Va., died on Sunday, August 5, of dropsy of the heart, and was buried at Ironton, Ohio, on August 8.

MANUFACTURING.

Iron and Steel.

The Sharon Iron Company, of Sharon, Pa., signed the Amalgamated scale last week, and operations have been resumed in all departments.

The Lawrence Furnace Company, of Ironton, Ohio, propose to build a 30-ton coke furnace in the vicinity of their present idle charcoal furnace at Culbertson, Lawrence County.

In our issue of last week we made mention of the sale of the Coatesville Iron Works at Coatesville, Pa., to Worth Brothers of that place, for the sum of \$41,050. These works were formerly known as the Viaduct Iron Works, and have recently been operated by Andrew Williams, of Plattsburgh, N. Y. The property includes over 100 acres of land upon which are four rolling mills, fully equipped, a grist and saw mill, eight double and six single tenement houses, and a number of other buildings. The mills were successfully operated for many years by Steele & Worth, and of late times have been in the hands of the Coatesville Iron Company, as whose property they were sold by the sheriff. The purchasing firm consists of J. Sharpless Worth and William P. Worth, sons of S. B. Worth, of the former firm of Steele & Worth. They now own and operate rolling mills in Coatesville, erected by themselves a few years ago, and it is their intention now to operate both these and the Viaduct Mills.

The large rolling mill of the Wheatland Iron Company, at Wheatland, Pa., owned by the Woods heirs of Pittsburgh, will soon be put in operation, after an idleness of more than ten years. The plant was built in 1872, and contains 13 double puddling furnaces, 12 heating furnaces, and three trains of rolls, and was built for the manufacture of skelp iron. The works have been idle on account of legal trouble. A new company, composed of Woods' heirs, has taken charge of the plant and will run it steadily. Bar iron will be the chief product, and nearly 300 men will be employed.

Judge Ewing, at Pittsburgh, has confirmed the sale of the mills of Graff, Bennett & Co. to James W. Friend, Jos. M. Bailey and James Richards, as trustees for the syndicate of creditors, mention of which was made in our issue of last week.

The plant of the Penn Iron Company, Limited, of Pittsburgh, was closed down for an indefinite period on Saturday, the 18th inst., on account of dullness in the iron trade. About 300 men were thrown out of employment.

The Warren Iron and Steel Company's big mill has resumed work after an idleness of five years, with the exception of a month's run last year. The 400 men go on double turn immediately.

The Warren Tube Company's plant, at Warren, Ohio, was offered for sale recently by Sheriff McKinley to satisfy a judgment obtained by creditors. No bids were received and the works will be re-appraised and offered for sale again. The selling price could not be less than \$77,000, which parties desiring to buy considered too high.

All departments of the plant of the Columbia Iron and Steel Company, at Uniontown, Pa., have been put on double turn in order to keep pace with the large orders which the firm have on hand.

James P. Witherow, engineer and contractor, of Pittsburgh, has received a contract for the erection of three blast furnaces for the De Bardeleben Coal and Iron Company, of Birmingham, Ala. The fur-

naces will be built at Bessemer about four miles from Birmingham. It is stated that the above-named firm will erect two more furnaces in the near future, and that Mr. Witherow will also build them. This large contract will keep the works of Mr. Witherow, which are located at New Castle, Pa., in operation on double turn for the balance of the year, and will give employment to about 200 men.

The employees of P. L. Kimberly & Co., Limited, proprietor of the Greenville Rolling Mills, at Greenville, Pa., have received one-half of the back pay due them at the time of the recent shut-down. The other half will be paid in two weeks.

The Pittsburgh Steel Casting Company, of Pittsburgh, have commenced work on the castings for the new Government cruiser Maine, a contract for which work has been secured by this firm. The patterns have not all been received yet, but, it is understood, some very heavy castings will be required.

Only three firms in the country have not as yet signed the Amalgamated scale. They are: Dilworth, Porter & Co., Limited, proprietors of the Glendon Rolling Mills, Pittsburgh; Whitaker Iron Company, Wheeling, W. Va., and the Globe Rolling Mill Company, Cincinnati, Ohio. It is expected that all of the above firms will sign as soon as repairs are completed and they are ready to start their works.

Lucy Furnace No. 2, of Carnegie Bros. & Co., Limited, at Pittsburgh, was blown out on Friday, the 17th inst., for the purpose of being relined and otherwise repaired.

The nail department of the Atlantic Iron Works, of P. L. Kimberly & Co., Limited, at Sharon, Pa., which has been idle for some months, resumed operations on Tuesday, the 14th inst.

The charcoal furnace of the Duluth Iron Company, at Duluth, Minn., built in 1872-73, has been definitely abandoned. It has been idle since 1883.

A dispatch from Bellefonte, Pa., under date of the 16th inst. reads as follows: "The Howard Iron Works' property has been levied on by the sheriff and is advertised to be sold on the 28th of August. The ironworks proper are situated in Howard township, near the borough of Howard. They consist of a rod wire mill, a bar mill, a muck bar mill, a machine shop, rolling mill, &c., with a charcoal furnace, 15 tenement houses, a store house, private dwelling, and all the ore and timber lands situated in Howard, Marion and Walker townships, with washing machinery, aggregating 1155 acres. The Howard Iron Works have not been in a very flourishing condition for several years. They have been owned and managed principally by Bernard Lauth, who has produced several very valuable patents, among which is the cold rolled iron process. One of Mr. Lauth's patents was a process for rolling steel plate for nails. This was tried in the Bellefonte nail works, but was abandoned after a thorough trial."

The steel department and rail mill of the North Chicago Rolling Mill Company's South Chicago plant were shut down temporarily on Tuesday of last week. The blast furnaces were continued in operation. The cause of the stoppage of the rail mill was the lack of orders for immediate delivery. Work will again be resumed toward the close of the month or early in September, to roll rails for which contracts have been taken for such deliveries. In the meanwhile it is hoped that more orders will be received to insure a steady run from that time.

Winona Furnace, of the Columbus and Hocking Coal and Iron Company, in the Hocking Valley, has blown in.

The work of dismantling and removing the boilers, engine, machinery and ironwork of the Monocacy Furnace, at Monocacy, Pa., has been commenced. One nest of boilers, the engine and fly-wheel will be taken to Norway Furnace, at Bechtelsville; the large tanks and a lot of other ironwork and machinery will be sent to Pottsville, while another nest of boilers and other portions of the plant will be shipped elsewhere.

A notice has been posted in the Penn Roiling Mill, Lancaster, stating that the finishing department will continue operations, the puddling department along suspending.

The North Branch Steel Company, at Danville, Pa., No. 2 furnace, Mr. F. E. Bachman, manager, made during the week ending August 14 476.5 gross tons of pig iron on a fuel consumption of 1.14 tons and limestone, 0.78 tons per ton of iron. The ore mixture averaged 53.81 per cent. and the temperature of blast 855°. The best week's work of this furnace under any previous management, with identically the same equipment, was 216 tons on an ore mixture giving 51.28 per cent. iron, a gain of 121 per cent. in output to the credit of Mr. Bachman. The fuel used was one-half coke, one-quarter Schuylkill and one-quarter Kingston anthracite coal.

The Charlotte Blast Furnace, at Scottsdale, Pa., which has been idle for the last year on account of trouble between the company and men over an advance in wages, which the company refused to give, is getting ready to resume operations again. The coke ovens have already been fired.

It is expected that the first forgings at the new gunshop of the Bethlehem Iron Company, at Bethlehem, will be made toward the close of this month.

A second of the furnaces of the Troy Steel and Iron Company is about to blow in, if, in fact, it is not already in blast at this writing.

The Troy Steel and Iron Company have put in new boilers at the steel mill. It is the intention to run one-half the boilers with coal and one-half with oil as fuel. It is expected that thus accurate comparative data will be gathered.

Machinery.

The Chicago Car Wheel Company, of Chicago, have made extensive improvements in their works this summer. All lifting will hereafter be done by hydraulic power. Tracks have been laid through the foundry to take the liquid metal on trucks to the molds, and afterward to convey the wheels to the annealing pits. The molds will be arranged in a straight line instead of a circle. The machinery will be run to and fro by friction. The result of these improvements is to place all the machinery under the control of the molder and helper, who will be able to perform their work with less exertion and greater expedition. A new engine has also been put in which is of sufficient power to operate the entire machinery, replacing two engines formerly used. The annealing capacity has been increased by the addition of 15 boiler iron pits to anneal without draft. N. S. Bouton, president of the company, prefers these to the draft annealing pits. He used draft pits 25 years ago, but began to use the other method 18 years ago, introducing improvements from time to time in the manner of placing them. These works have a cupola capacity for the production of 300 wheels a day, but do not usually aim to make over 250. Improvements are also being made at Bouton & Co.'s car-

wheel works at Aurora, Ill. Hydraulic lifts have been put in, and two of the molding floors are already supplied with tracks for the passage of trucks with molten metal and for the transfer of wheels to the annealing pits. At present the demand for car-wheels is not active, but the manufacturers look forward to a revival of business by next spring at the latest.

Charles Kaestner & Co., of Chicago, have recently taken a number of important contracts for machinery. They are furnishing the Keating Marble Works a new engine and boiler; the Chicago Brewing Company their entire outfit, consisting of the Kaestner patent mashing machine and grain remover, malt mill and draining reel; a 60-horse-power engine, &c.; the Curry Mfg. Company, a 72-inch lead chaser, a 2500-pound power mixer, a 30-inch lead and zinc mill with cooler, and double water-cooled japan mills.

The Bouton Foundry Company, of Chicago, are making additions to their machinery with the view of enabling them to complete all classes of work in themselves as far as possible. Among the latest machines they have purchased is a mill capable of handling pieces 16 feet in diameter and 5 feet in height. It will bore at any angle and will turn large castings with ease.

The Harrington & King Perforating Company, of Chicago, are building up a large export trade, their business with foreign countries this year being heavier than ever before. They are shipping perforated metal to Australia, South Africa, South America, and in fact to all parts of the world in which gold mining is carried on.

The National Pneumatic Tool Company, have been incorporated at Chicago with a capital of \$200,000. The incorporators are Charles D. Woolwich, Harry Hunter and John Platner.

At the annual meeting of the stockholders of the Pittsburgh Motor Company, held in the office of the company, in Pittsburgh, last week, the following officers and directors were elected: President, John E. Ridall; vice-president, James B. Scott; secretary, W. L. Eaton; treasurer, F. C. Hutchinson. Executive Committee: C. L. Magee, James B. Scott and John E. Ridall. Board of Directors: C. L. Magee, James B. Scott, H. S. A. Stewart, John E. Ridall, C. C. Scaife, A. M. Nepper, John L. Blackwell and George Renault. The three last-mentioned gentlemen are residents of New York. The territory of the Pittsburgh Motor Company embraces Pennsylvania, Ohio and West Virginia. It was this company which constructed the Observatory Hill Electric Railway in Allegheny. It has no roads in course of construction at present.

The Westinghouse Air Brake Company have awarded the contract for the foundation of their large works on the Pennsylvania Railroad, near Wall's Station, and work has already commenced. The cost of this part of the structure alone is estimated at \$150,000. Among the structures to be built for the company, and for the foundation of which the contract was let yesterday, are the machine shop, the foundry, the boiler house, the blacksmith shop and the shipping shop. The machine shop is to be 500 x 250 feet, the foundry 500 x 300 feet, the boiler house 160 x 80 feet, and the blacksmith shop 250 x 150 feet. A. Peebles is the architect, and when these buildings are completed ready for the machinery they will not have cost less than \$850,000 or \$1,000,000.

During the last six months the Union Mfg. Company, of New Britain, Conn., have added considerable new machinery, including patterns, tools, &c., to their chuck department, which is now one of

the largest in the country. This firm manufacture lathe chucks in 3 to 42 inches, inclusive, and with two, three and four jaws. We also understand that they make special styles of jaws and drawings. Their chucks are used very largely in this country, and we are informed that they have had a considerable sale abroad.

The Harrison Machine Company, of Belleville, Ill., have manufactured and shipped this season 320 separators, 95 engines and 85 straw stockers.

The Southwestern Agricultural Works, A. G. Munn, president, report business good. They make specialties of saw mills, cane mills and evaporators, grain drills, cider presses, feed and straw cutters and corn shellers. Owing to excellent crop prospects the demand for some of their agricultural implements has more than doubled that of last year. Their salesmen report as an indication of prosperity through the cotton belt that the farmers have a largely increased area in corn planted, and this fact which concerns the company so closely has caused them to manufacture their goods more extensively than ever. They have this year placed several of their improved saw mills down on the South Atlantic Coast in the yellow pine belt.

Miscellaneous.

William F. Remppis & Co., of Reading, Pa., manufacturers of wrought-iron railings, fences, fire-escapes, &c., have removed to their new establishment on the river front, near the Lancaster Bridge, in that city. Another addition has just been erected, and they now have better facilities than ever for attending to their business. They are engaged at present in preparing the window grates for the Pennsylvania Trust Company's new building, and have enough orders on hand to keep their establishment busy during the coming fall and winter.

A great deal of red tape is being played out in the matter of the Louisville and Jeffersonville Bridge. The promoters of the enterprise, who believe the bridge will be a great benefit to both cities, strongly advocate a certain location connecting the centers of business of the two sides of the Ohio River. They are bitterly opposed before the War Department by the Louisville and Jeffersonville Ferry Company, who are doing a lucrative business between the cities, which the bridge would naturally interfere with. Most of the river men have sided with the ferry company in the fight, urging that the location of the piers just in the upper part of the harbor would greatly endanger the coal fleets and large boats as they "round to" preparing to go down the falls. This view should be thoroughly studied, as the Louisville harbor is a very important one, through which all boats going over the falls or down the Portland canal have to pass, and the Secretary of War is weighing the matter carefully and has given the opponents 30 days to file their protests. As Congress has already granted the right for the bridge to be built across the river, the objections now are purely as to location, the river men wanting it put in the upper ends of the cities, which would virtually kill it. Dennis Long, the venerable and successful foundryman, of Louisville, is at the head of the enterprise.

The shipowners of Nova Scotia and New Brunswick are united to secure such legislation as shall prevent the construction of more timber rafts for export.

The collapse of the strikes in Paris is due largely to the unexpected firmness of the Floquet Ministry.

The Connellsville Coke Trade.

Within the last month or so a decided improvement in the coke trade, both as regards price and demand, has taken place, and the operators in the Connellsville region are greatly encouraged with the outlook for the future. Since last March this important industry has been in a very demoralized condition, and with the low prices at which coke has been sold, it is extremely doubtful if the operators have made any money during the last six months. In January of this year coke was selling freely at \$1.75 per ton, and the majority of the ovens in the region were being operated to supply the demand. In March a reduction of 25 cents per ton took place, and in the latter part of that month another fall took place, which put the selling price at \$1.25 per ton, lower than it had been for years. When this low price was reached the operators claimed that there would be no further decline. In this, however, they were mistaken, as in April another decline of 25 cents per ton took place, which put the price at \$1 per ton, and with a demand barely sufficient to keep half the ovens in operation. The market continued in this condition till the beginning of the present month, when a decided improvement set in, and where a month ago the operators were only too glad to dispose of their product at \$1 per ton, they now refuse to make contracts for future delivery at less than \$1.25 per ton, and it is believed that before many days the price will have advanced to \$1.50 per ton. One of the largest operators in the region, whose headquarters are at Pittsburgh, took a contract last week to furnish a number of cars each day until January 1, 1889, at \$1.25 per ton. Less than a month ago there were not over 60 per cent. of the ovens in the entire Connellsville region in operation, and they were running only four days per week. At this time there are more than 75 per cent. of the ovens in operation and they are running six days per week.

The reason advanced for the improvement in this industry is the resumption of the mills in the West that were idle during the recent lockout, if it may be so called, and the blowing in of a number of idle blast furnaces, which, of course, would greatly increase the demand. In Pittsburgh and the Mahoning and Shenango valleys the mills and blast furnaces are more generally employed now than at any time this year, and the demand for coke from these sections is particularly heavy. The same is true of Wheeling and other points in the Ohio Valley, where the demand for coke at the present time is very large. In connection with the improvement in the condition of this industry comes the report that an attempt will soon be made to form another coke syndicate, and that steps have already been taken looking to the consummation of this object. To this report, however, but little significance is attached by those familiar with the trade. During the early part of the year, when attempts were being made to revive the old syndicate, it was pointed out that success depended upon including all the large operators, and that would be necessary to-day. One of the largest firms in the region, who were charged by the other operators with being the cause of the disruption of the old association, have absolutely refused to support any attempt made to form a new syndicate, and for this reason we repeat our statement that without united action all attempts will go for naught. The reason advanced by this firm for their refusal is that the old syndicate has refused to pay to them a large amount of money on account of contracts taken for coke at a low price. Until a settlement is made with this firm and their co-operation is secured it will be impossible to form a coke syndicate.

The Iron Age

New York, Thursday, August 23, 1888.

The Iron Age Index.

A complete Index for Volume XLII, January to June, 1888, is now ready. Subscribers desiring to have a copy should apply early, as only a limited number have been printed.

Heavy Ordnance for Fortifications.

A perplexing struggle has been going on in both Houses of Congress, during the past week, over the legislation which is to provide for heavy ordnance for the army. Briefly stated, the course of events during the present session has been as follows: The House framed an army appropriation bill providing for funds for the usual routine expenditures, to which the Senate added \$5,000,000 for rough steel gun forgings for heavy ordnance, and \$750,000 for providing machinery and equipment at the Watervliet Arsenal to assemble the parts of heavy guns and finish them. The House declined to concur in the Senate amendments, and some discussion accompanied by attempts to delay action grew out of the question whether the Military Committee or the Appropriation Committee should represent the House in the conference. The former carried the day, and the representatives of both Houses quickly agreed upon a compromise. It simply appropriates \$3,500,000 for steel forgings for guns, a reduction of the sum originally proposed of \$1,500,000. No caliber is specified, nor are any further expenditures in later years planned. The point was debated at some length whether such a sum would be sufficient to secure to the Government the benefits of competition among private manufacturers, and objection was raised to the fact that the bill confines army officers to the purchase of built-up guns—that they have no discretion to take any other method. The conference cut down the appropriation for the Watervliet Arsenal, at Troy, to \$700,000, and in that form passed the Senate, the House not having voted on it as yet.

In the meantime the House has passed a far more elaborate bill, under the title of the Fortifications bill. It embodies a far more comprehensive plan of providing for the defense of the country by calling for not less than fifty 12-inch, twenty 14-inch and twenty 16-inch breech-loading steel guns, for not less than thirty 12-inch breech-loading cast-iron guns, and not less than fifty 12-inch cast-iron mortars. The time estimated in order to complete and test five experimental guns is 4, 4½ and 5 years respectively for the steel guns and for the other ordnance 20 and 16 months respectively. The steel guns, it is believed, can be completed in 10 years for the smaller calibers, 11 years for the larger guns and 13 years for the 14-inch

guns. It will be observed that the bill especially takes into consideration the views of those who insist that iron guns are a weapon serviceable under modern conditions of warfare.

The estimated cost of the contracts may, according to the promoters of the bill, reach \$13,255,433, proportioned as follows: For the purchase of steel guns, \$8,804,980; cast-iron guns, \$750,000; mortars, \$300,000; gun carriages, \$3,446,457, and mortar carriages, \$350,000. No contract is to be made which will require an expenditure exceeding, in the aggregate, the sum of \$13,255,433, nor an expenditure in any one year, greater than \$2,500,000, the present appropriation made being \$2,477,670. A special board is to carry out the work of providing the heavy ordnance, consisting of three officers of the army and three civilian, engineers, of whom at least one must be experienced in "the quality and working of steel." These civilian members of the board are to receive a salary of \$5000 per annum.

An important provision in the bill is that "no money shall be expended except for steel accepted and delivered, and no contract shall be made for gun steel at a greater average price per pound for each caliber than the lowest average price charged under contracts hitherto made by the Government for forgings of like caliber." The idea underlying this provision appears to have been that since steel has been growing cheaper during the last 20 years, therefore in the future successive bids must be as low, if not lower. There seems to be a great though unfounded dread that there will be no competition for Government gun-steel contracts. It was distinctly and emphatically stated by some of the opponents of the bill that the Bethlehem Iron Company will demand whatever price it chooses to name, and that the Government will be practically helpless. The critics alluded to did not even know that the Midvale Steel Company have made a considerable number of forgings of large caliber, and that the Cambria Iron Company have taken some contracts. We believe that with the adoption of a comprehensive plan for fortifications, giving steel makers a reasonable assurance that the demand for heavy guns will not collapse after a year's spurt of generosity, more than one responsible concern will be found willing and anxious to engage in the work or to extend present facilities. The House fortification bill holds out the promise of such inducements, which, coupled with the requirements of the navy, would insure to both arms of the service an ample supply of the best material.

The Fortification bill has passed the House. It remains to be seen whether it will carry the day over the conference compromise accepted by the Senate.

A good many newspapers continue persistently to speak of a number of "trusts" in the iron trade. When at any time during the past year any report reached the daily press that a trust had been formed in any department of the trade, the industrious compilers of trust literature added one to their little list. The result is startling, to say the least. Sanguine nail-makers have been talking of arranging a combination for many months past. Plan after plan has been suggested only to fail, cut nails in the meantime selling at \$1.75 to

\$1.85 at mill, East or West. Competition of the liveliest kind has kept values down to the unremunerative figures mentioned, and yet the opponents of "trusts" are serenely carrying along the nail trust among the catalogue of iniquitous monopolies. Lead is another one of the articles afflicted with the reputation of being under the control of a trust. It acquired it from the fact that a smelter in New Mexico, a refiner in St. Louis and a manufacturer in the same place pooled their issues. That operation was merely a consolidation of interests, and together they do not handle 3 per cent. of the whole output of the metal. Competition among producers and refiners of the metal is as keen as it is among the New York dailies, and the only shadow of a trust in the trade is the persistency of the leading speculator in the metal in trying to hold it up in spite of growing production and a stagnant demand. Another representative "trust" is that in copper. A clique of French operators believe that they can corner the supply of the world for three years to come, and have bought the output of the leading mines in all countries, among them those of this country. Their trust in the future is generally regarded as sublime, but no one knowing the facts could very well indicate how such a gamble can be compared to what is ordinarily known as a trust.

The Manufacture of Tin Plate.

A short time since we gave place in our columns to a suggestion on the tin-plate question which has provoked considerable discussion. This was expected, and it would have been a disappointment if no notice had been attracted by the novel proposition which was set forth. There are many persons connected with the iron trade who think it nearly time that the tin-plate problem was seriously taken in hand, and they believe that the sheet-iron manufacturers are the people who should do it. These gentlemen approve the suggestion that was made. Others, however, viewing the matter in what they term a pure business light, see no opportunity for an immediate return on the investment which would be necessary, and they therefore oppose it. The adverse criticisms which have been made have often been quite amusing, their authors seeing in this subject a wide field for the display of facetiousness. Their humor is appreciated, but in this particular case it seems to be misapplied, as the various interests involved are of too great importance to be trifled with.

The proposed method of attempting to establish a tin-plate industry in this country, by the erection and operation of works built by the united subscriptions of sheet-iron and galvanized-iron manufacturers, has not been put forth by its advocates because they expect to create a lucrative investment for idle or unproductive capital. As we understand it, the suggestion has been made primarily in the interest of the sheet-iron trade of the country. If the manufacturers of fine sheet iron speak with a full knowledge of the subject, and they should certainly be able to do so, their prosperity and the regular employment of their workmen at good wages would be seriously interfered with if tin plate should

be put upon the free list. As they would suffer most, it would seem to rest with them to institute vigorous measures of defense.

This is not a question of "fairness," which Mr. Cronmeyer calls up in his communication on the subject in another part of this issue. Unfortunately, our tariff laws are not constructed so as to treat all interests fairly. They never have been and probably never will be. Mere verbal argument and demonstrations on paper are apparently no nearer accomplishing the establishment of an American tin-plate industry than they were five years or ten years since. It is urged that the question now before the sheet-iron manufacturers is how shall the practical difficulties of the situation be met? "It is a condition not a theory" that confronts them, and it should be met in a practical way. It is not a question of philanthropy but pure business. Those who favor the suggestion argue that the sheet-iron manufacturers would risk five dollars to save probably twenty-five.

Appeals to Congress for an increased duty on tin plates have been made for years without success. The great possible benefits of such a policy to the trade of the country at large have been set forth in as vigorous language as it was possible to command. The answer has been steadily made by members of Congress that there is no tin-plate industry in this country, and that it would be an absurdity to double the duty on an article which must be imported, especially when the national Treasury is gorged with surplus revenues. When told that increased duties would create the industry they are ready with the reply that they must first be convinced that tin plates of good quality can be made here. The experience of the small works in existence 12 to 14 years since is too old to use with effect now. Hence arises the suggestion, put forward almost as a forlorn hope, that a practical demonstration should be given of the ability of Americans to produce tin plate, and the rate at which it could be made when paying the prevailing prices for labor.

The movement in favor of free tin plates is continually gaining in strength, and every month adds to it that sees no step being taken by American manufacturers to establish the industry here. Many persons who class themselves as protectionists are now in favor of free tin plates, as they claim that the question of protection is not involved in the present discussion of the duty on this article. The duty of 1 cent per pound may not be sufficient to entirely cover the difference in the cost of manufacture here and abroad, but it certainly goes much further than no duty whatever. The strongest argument now made in favor of the abolition of the entire duty is that it has existed for years without contributing to the establishment of a single tin-plate works in this country, and it is regarded by consumers as an altogether unnecessary tax on them. They take no account of the indirect effect this duty has on the sheet-iron trade, or if they do understand it, they choose to completely ignore it. The manufacturers of fine sheet iron are even now well aware that for stamping purposes a large part of their product is being displaced by tin plate, which can be had at a lower price. If the duty on tin plate should be entirely re-

moved they would be affected very much more severely; and once off it would only be restored under the stress of some great public convulsion like our late civil war. It is urged that they should "carry the war into Africa" and retaliate on the foreign tin-plate manufacturers, and it is insisted that it would be folly to postpone action until after tin plate has been made free.

Brazil Since the Act of Emancipation.

It is fortunate for Brazil that Dom Pedro II recovered his health and is now on his homeward voyage, as his conciliatory spirit is likely to prevail, and the planters will receive some sort of compensation for the sudden loss of their slaves by the law of May 13. Baron de Cote-gipe's bill to give the ex-slave owners 200,000,000 milreis compensation, or \$104,000,000 American gold, received its quietus on July 18 last, the Senate throwing it out by a vote of 29 to 13. This was a foregone conclusion, and, in fact, the efforts of its supporters to provoke a debate, or at least to postpone the *coup de grâce* until later in the session, only served to manifest that the refusal of the planters to listen in former years to any proposal to fix a definite date for ending slavery had completely alienated the great majority of the Senate. It created the feeling that in losing all the planters had but received their deserts. As in the Chamber of Deputies the same feeling is also largely prevalent, the Government measures for the relief of planters, by furnishing them with money at 6 per cent. interest, are met with active hostility, so that on July 21 the bill for establishing mortgage banks with 5 per cent. guarantee on their issues had only arrived at the second reading of the second clause. The Government, indeed, is just now between the proverbial two stools—the abolitionists are bitterly opposed to any favor to the planters, while the latter look upon the proposal to lend them money on mortgage as a veritable insult to men claiming to be ruined by what they consider an iniquitous law. Republican meetings, are, therefore, the order of the day.

Whether and to what extent labor on the plantations will be disorganized time will show. Before the act of emancipation was passed there was a tendency on the part of slaves in the coffee districts to leave the estates by hundreds, and take to the mountains, in a good many localities. This was during last winter and spring; now that they are free we hear of no disorders of any kind so far, and the large coffee crop is being brought under shelter without difficulty or delay. Most of the coffee planters themselves, to tell the truth, have grown rich during the last three years; if last year's crop showed a great deficit, the price obtained compensated for it, and as for the sugar planters, the prices the crop now beginning to be marketed is likely to bring will be higher than they have obtained during half a dozen seasons in succession. At no time since September, 1871, when the first steps toward abolition were taken, were Brazilian coffee and sugar planters in better position to face this sudden loss than at present, and, as Dom Pedro II stands above the contending parties, he will not

find it a very difficult task to bring about a compromise, and thereby remove the danger of revolution upsetting his monarchy.

The new coffee crop now beginning to arrive on our shores is estimated at 5,000,000 bags Rio and 2,500,000 Santos.

The shipments during the previous four crop years from Rio and Santos, taken together, were as follows, in bags of 60 kg., July 1 to June 30:

	1887-88.	1886-87.	1885-86.	1884-85.
To Europe.....	1,288,900	3,053,083	2,162,084	2,926,567
To the United States.....	1,715,217	2,582,617	2,897,400	3,063,433
To other countries.....	108,050	134,033	125,000	141,667
Totals.....	3,112,167	5,769,733	5,184,484	6,071,667

Sugar crop prospects are fair. The shipments from the last crop, drawing to a close with the month of June, were as follows from Pernambuco up to July 7:

	1887-88.	1886-87.	1885-86.
	Tons.	Tons.	Tons.
To Europe.....	58,245	12,108	13,349
" the United States.....	69,329	54,482	46,740
" South America.....	38,140	68,051	29,415
Totals.....	165,714	134,641	89,504

The central sugar house system seems to work so well at Pernambuco and Bahia that Brazilian sugar crops are assuming larger proportions year after year, provided the canes get rain enough.

India-rubber, next in importance, shows no falling off in production; on the contrary, it is on the increase. In 1886-87 the export from Para was 13,390 tons, being 390 tons in excess of that in 1885-86. This year the demand is greater than ever, and high prices prevail. The United States take about half of what the Amazon Valley turns out. Our import of india-rubber during the fiscal year ended June 30, three-quarters of which was Para, direct or via Liverpool, was as follows:

	1888.	1887.
	Pounds.	Pounds.
Imports.....	36,628,351	28,649,446
Re-export.....	377,731	638,317
Net import.....	36,250,620	28,011,129
Increase.....		8,239,491

This is an increase of about 30 per cent.

Hides have risen 1½ cents in our market in a little over a month. We received from Rio Grande do Sul last year at New York alone 68,836, against 82,639 in 1886 and 106,252 in 1885. There is, indeed, hardly a Brazilian product not in good position to-day. This will assist in smoothing matters in the Empire; it will improve the finances which are recently more flourishing than they have been for ten years past, and so is the exchange on London, now as high as 26½ pence per milreis.

Our export to Brazil is likely to be large this year, especially that of flour. During the calendar year 1887 we exported to that country domestic merchandise to the amount of \$7,103,845, against \$7,477,466 in 1886, while we imported thence \$56,377,719 worth of products, as compared with \$43,266,477 the year before, the great increase being due to the advance in coffee.

We believe that since 1872 and 1873—when coffee was high—Brazil has not been flourishing to the same degree as it has done since 1885. To have at length got rid of the slavery problem is as much a blessing to Brazil as it has proved to Cuba, and the former has at least the advantage over the latter that in the coffee regions white men can work. Perceiving this the planters are procuring agriculturists from

the north of Spain and other suitable localities, and in this manner disorganization of labor of a serious kind may be avoided.

CORRESPONDENCE.

Undervaluation of Steel Blooms.

CHARLEROI, BELGIUM, August 10, 1888.

To the Editor: I see to-day only that in *The Iron Age* of the 5th of July last you published, under the heading "Undervalued Steel Blooms," an article quite contrary to the truth, and against which I must protest at once. As all the matter in question depends now on a lawsuit which I instituted here and in your country against the parties named I cannot discuss in your newspaper all the facts you describe, but I can already tell you that I am suing the calumniators, claiming \$50,000 damage for their false reports.

I have no profit to undervalue any steel blooms, as I always sold any steel blooms f.o.b. Antwerp, and "the risk of duties is for account of buyers," as usually done in the steel business and often reported in your own newspaper. No European seller, unless he is an inexperienced man, would do otherwise with your ad valorem system of duties, like those on the steel products, which pay 45 per cent. on the value declared. The best proof of it is your own report in *The Iron Age* of December, 1887, as follows: "At the port of New York during the past fiscal year there were 14,050 invoices upon which additions were made by importers, and 17,805 invoices were advanced by appraiser. The amount of such advances upon the principal articles subject to ad valorem duties was \$2,658,306." Is it reasonable to say that New York importers of the principal articles subject to ad valorem duties defrauded your Custom House 31,855 times? Not at all, but it is a proof that your system of ad valorem duties is quite defective.

I request you to publish the present letter in the next number of *The Iron Age* with the same paging and the same text which you used against me in yours of July 5. ANDRIS-JOCHAMS.

[We make room for the letter of our correspondent, although it does not touch the questions at issue. We may state, however, that he is in error when he asserts that steel blooms, or any other forms of steel upon which there is a duty of 45 per cent. ad valorem, are usually bought with the proviso that the risk of duties is for account of buyer. Excluding exceptional circumstances, foreign steel is sold at a fixed price, the importer taking the entire risk.—EDITOR.]

The Duty on Tin Plates.

PITTSBURGH, PA., August 14, 1888.

To the Editor: Although I well remember the advice you gave me some six years ago, when you had for awhile the kindness to publish my correspondence relating to the tin and terne plate industry, I now take the liberty to once more request you to allow me to say something on this subject to your readers. I am induced to do this by the urgent solicitation of many friends.

Your advice at the time mentioned was that inasmuch as the tin-plate question had been reviewed in all its phases it did not appear necessary to continue an elaborate discussion of the subject, and as your admirable invention of a table of quality classification seemed to remedy to some extent the most serious evils from which workers in tin and terne plates were then suffering, I heeded your advice and kept quiet on that "hobby of mine," as some of our correspondents were pleased to

call it, to see what effect your plans and suggestions would have; but in the meantime I have not kept my eyes closed, but have made use of the opportunities which have presented themselves to me to make some personal observations and investigations regarding the tin and terne plate industry in England and Germany as well as in America.

And now, when after the lapse of six years the same complaints as before (pinholes, unreliable coating and tenacity, &c.) are heard, and when our company almost daily receive inquiries whether we cannot furnish such plates as we used to in years gone by, and we still continually furnish iron and soft steel sheets to customers who have tinning establishments of their own, to be used in the manufacture of such tinned goods as they must sell under guarantee, I believe a rehearsal of what was said in those times will not be without interest to your readers.

In that editorial you allude to the suggestion that the sheet-iron manufacturers (they being the most interested parties) should demonstrate the feasibility of manufacturing tin and terne plates in this country at their own expense. Now, Mr. Editor, do you really think that is fair, when you can certainly find by referring to your own columns that such demonstration has been made over and over?

You have published in the long ago a whole series of testimonials to the good qualities of tin and terne plates made in this country; you have published comparative items of cost in Wales and here, and a great deal more information can be found in the records of Congress, and now to demand, after all that has been said and demonstrated, to do this thing over again is, in my opinion, not fair. In 1873 three companies, induced by the then very high prices of imported tin and terne plates, and under the mistaken belief that the law which provided that "tin plates, or iron coated or galvanized with any other metal, should pay duty at 2½ cents per pound" was justly enforced, started tin-plate works, and for a while operated successfully, until English manufacturers, having become alarmed, reduced, and, under an erroneous Treasury Department decision, were enabled to reduce the prices to such a figure that our home manufacturers were forced out of the market.

Yet to-day, while the prices of tin and terne plates have ruled comparatively low since then, there is still left a nice little profit for the English manufacturers, their carriers and middlemen, which amounts to just about the additional duty we ask for. I have compiled and before me now a table comparing the cost at which tin plates can be manufactured with the established prices of labor in Wales and in Pennsylvania. The calculation is based on a box of 1C, 14 x 20, of medium charcoal quality, such as are being quoted at from \$5.25 to \$5.50 per box in New York, and the totals show that such plates can be produced at prices for labor paid in South Wales at \$3.37; at prices paid for labor in Pittsburgh, Pa., at \$5.25. Allow the manufacturers in either place a margin for profit and risks of 8 per cent, and the comparison will show \$3.63 for Wales to \$5.67 for Pittsburgh, and then allow the home manufacturer another small margin for the incidents and accidents which accompany the establishment of any new enterprise, and for the possibility that the foreigners may be able to find means to further reduce their cost, and our demand for a duty of 2½ cents per pound will not appear unreasonable. I could give you this table for publication, but in the first place it is a very long one, and, second, it goes against my sense of business methods to publish the detailed items of cost of any article, because the majority of the readers are not supposed to understand these de-

tails; and it would necessitate such a long explanation that it would require a whole book to make it. However, the figures are open to any investigating committee of legislators or economists who will be willing to listen to explanations.

Of course I realize that likely my assertions will be denied or misconstrued by interested opponents (to them it is useless to talk), but to those who are in honest doubt in regard to the most expedient course to be pursued in this matter, and especially to your correspondent, Mr. Wilkins Trick, who coincides with your views, that the sheet-iron manufacturers ought to put up the money to demonstrate the necessity of increased tariff, I would put the question whether Mr. Wilkins Trick himself has not demonstrated this point with his and his friends' money; for he certainly would not have quit making tin plates at his establishment at Hubbard, Ohio, if he had found that such was profitable under existing circumstances.

We gave Mr. Trick our sad experience before he started, and we told him that an advance of from 25 to 50 per cent. over the wages paid in Wales would not make adequate wages for American iron workers, and that he had to calculate on at least 100 per cent. to be safe, but he thought he knew better and did not profit by the experience we had gained about seven or eight years before him. Now, if four firms have demonstrated that tin plates and terne plates can be made in this country satisfactorily, as far as quality is concerned, but have also demonstrated that, for want of protection, the foreign manufacturers are in the position to sell at our cost, or from 2 to 3 per cent. below it, they reaping at same time a profit of from 15 to 20 per cent. on their sales, and when Mr. Trick, as well as ourselves and several other American citizens, can produce convincing facts and figures to our legislators, why should the sheet-iron manufacturers, or some of them, put up the money, simply to suffer this *British monopoly* to be continued on our shores? Business is not carried on for the sake of pure philanthropy. When we, and likely any other manufacturers, go into the business of manufacturing tin and terne plates again we will do so with the prospect and intention of establishing a business which will be remunerative to ourselves as well as bring prosperity and wealth to the community and the country we live in. I do not only deem it preposterous to ask a few individuals to sacrifice their earnings, but think it is the solemn duty of our government to thoroughly investigate this question and to foster the industry.

As citizens of a free country, where equity and justice are, or ought to be, the first principle of government, we ask for equity and justice to American capital and labor. Grant us this and this only, and with American ingenuity and skill we will defy the world. The very fact that the tin-plate industry has not been granted protection, in harmony with the prevailing policy of the American people, has become a matter of ridicule and contempt on the other side of the ocean, and yet some hidden influences have so far always induced our legislators to legislate in favor of a foreign tin-plate industry rather than for an American one. This is certainly the time to ask for a change, and we do not call upon Jupiter to pull us out of a hole as Mr. Trick pleases to term it, but we shall and do call upon a power in which we have more faith than in Jupiter, and that is the vote of the American people.

But let me give yet a few figures showing how a law protecting the American tin and terne plate industry by a duty of 2½ cents per pound would operate. As said above, with the rate of English wages a box of tin plates can be produced at \$3.37; the average selling price in New

York is \$5.37, showing a margin of \$2 per box; \$1.05 of this goes into the Treasury of the United States; 95 cents go to foreign producers and their agents. The consumption in the United States of foreign-made tin plates has now grown to about 6,500,000 boxes, consequently we pay to foreigners an annual and actual tax of \$6,275,000.

Give us the rate of duty of 2½ cents per pound, or \$2.30 per box of 105 pounds, and the American manufacturer will be able to obtain about \$5.67 per box, which price would include his cost and a margin of .8 per cent. I will admit that this is about 30 cents per box more than the present selling price; but can anybody guarantee that if legislation were adverse to us, and all possibility of an American tin-plate industry were removed, the foreign manufacturers would not increase their prices to the same extent and more? They certainly did get much more than present prices from us before. But take the 30 cents per box and add it to the aggregate we now pay foreigners and you will have \$8,225,000—but this amount is not sent out of the country, but remains right here in the United States family as it were—and I would ask any farmers, mechanics or professional men whether they would not rather pay a member of their family, for whom they have to provide a living any way, \$8 for a certain amount of work than to have the same work performed by an outsider for \$6 while the member of the family is kept in idleness? But then, further, not only this difference between English cost and American selling prices would remain in the country, but the \$22,000,000 of the English cost also—keeping in circulation at home a total of \$30,000,000 annually, which, occupied in turning the ore, coal, limestone, &c., in our hills into merchandise, and in carrying and transporting the same over the country, would actively keep employed over 100,000 people; and these in turn would give employment to another large number of farmers, butchers, grocers, tailors, shoemakers, builders, &c., to keep them in provisions, meat, clothing, shoes, &c.; the latter again would be consumers of the products of our industries; and so it would go on, *ad infinitum*, until a city of the size of Pittsburgh would hardly be large enough to hold all the people who had thus been provided with honorable, decent means of living. I could go on demonstrating further, but presume this is enough for to-day. With your permission I will address you some other time.

Yours respectfully,

W. C. CRONMEYER, Chairman,
U. S. Iron and Tin Plate Co., Limited.

Gatling's Cast Steel Gun.—Dr. Gatling has invented a new steel gun which he claims will be far superior to the built-up gun, and can be made at half the cost. Speaking more definitely, he says: "My patents consist of making guns cast from the highest grade of steel to shape around a central core. This central core is utilized for the purpose of cooling the casting from the interior while the exterior is still hot. The cooling process thus begins from the interior and works out, directly the reverse of the ordinary way. This is one of my central ideas, and the results are of the greatest importance. The metal is forced, as it were, from the interior outwardly, thereby avoiding the creation of a hard, resisting arch on the exterior of the casting, at which point the full intensity of the high power force exercised by the exploding ingredients within the gun exerts itself. It makes the interior of the gun, where the greatest strain is felt, the toughest and hardest part, and the soft and spongiest part the exterior, which thus acts somewhat after the manner of a cushion.

This is directly the reverse of the old style guns, in which the spongiest part is on the interior. This defect cannot be remedied in a gun made by boring a solid steel ingot, for there, although the very softest portion is bored out, still the hard resisting arch is on the outside, which becomes gradually softer toward the interior. Another important point is the method in which the metal is cast. A revolving motion is given it which makes the grain spiral."

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., August 21, 1888.

The Senate Sub-Committee on Finance did not bring their bill before the general committee to-day, nor do they intend to for awhile. It will not be reported to the Senate until all the business pending there has been disposed of. It has come to their attention that the President is waiting for their bill, in order to make some references to it in his letter of acceptance of the St. Louis nomination. As there is no immediate urgency in getting the bill before the Senate, the committee have decided not to be in haste.

A deputation consisting of E. P. Williams, U. S. Tin Plate Company; Alfred Marshall, of Marshall Brothers; and Charles Gilpin, appeared before the Senate Committee to-day in favor of placing a duty on tin plate which will be protective. The importations last year, it was shown, footed upward of 300,000,000 pounds, and this year the amount will be greater. It was shown that this would consume a certain amount of pig iron, in the elementary processes and sheet iron in the advanced stages, and give employment to fully 30,000 more workers. They showed that free trade would not reduce prices, but in time would increase it, and cited block tin, which is free and controlled by the Dutch, as having increased within a short time fully 100 per cent. in price. They also showed that there was outrageous evasion of duty. Sheet iron with a thin coating of tin is now brought in as tin plate, which was never contemplated in the law. The deputation made a good impression, and their arguments found an appreciative audience. Whether the committee, in the face of an election, will be prepared to reduce revenue by increasing the duties, which is the only effective way short of free list of reaching that result, remains to be seen. The Randall bill adopted this course, putting the duty on tin plate at 2 cents a pound. The Mills bill made it free. It is now the Senate committee's turn to say what they will do.

TARIFF REVISION IN SWEDEN.

The people of Sweden have been having a campaign on protection, and have succeeded in getting into power in the Swedish Diet. They have made many radical changes in the customs duties of the kingdom, and have fairly embarked on a protection line. On July 1, 1888, the new revised tariff went into operation.

The rates are given in kroner, 1 kroner being equal to \$0.268, and öre, 100 öre making 1 kroner. The following are the articles in the schedule of metals upon which the duty has been increased, giving the old and new rates on the same articles:

	Old rate. Kroner.	New rate. Kroner.
Iron and steel, pig and cast, per 100 kg.....	2.00
Iron beam, angle, &c., weighing less than 20 kg. per meter, per 100 kg.....	2.50
Iron rolled and wrought bar, &c., per 100 kg.....	2.50
Iron railroad fish-plates, bolts and spikes, per 100 kg.....	6.00
Iron plate, roller or wrought, of 3 mm. or over thick, per 100 kg.....	3.00
Iron plate, roller or wrought, of less than 3 mm. thick, per 100 kg.....	4.00

Iron plate, roller or wrought, ground, polished or galvanized, per 100 kg.....	6.00
Iron anchors, &c., per 100 kg.....	4.00
Iron chains, 25 mm. or over in diameter, per 100 kg.....	3.50
Iron chains, 6 to 25 mm. in diameter, per 100 kg.....	7.00
Iron spikes and nails, 45 mm. or over in diameter, per kilogram.....	0.03
Iron screws, 75 mm. or over in diameter, per kilogram.....	0.20
Iron screws, less than 75 mm. in diameter, per kilogram.....	0.30
Iron railroad materials not specified, per 100 kroner.....	10.00
Wire, iron and steel, 1½ mm. and over thick, per kilogram.....	0.04
Wire, iron and steel, less than 1½ mm. thick, per kilogram.....	0.08

THE SWISS PATENT LAW.

The Republic of Switzerland has passed a law for the protection of inventions, thus following in the wake of other nations. The final disposition of the question, however, as to whether the law shall be operative or not, will first require the petitions of 30,000 voters asking its submission to the people. That point gained, the law must then be submitted to a vote and be approved by a majority. It is not stated whether the Swiss Government has a patent on this method of giving a law force. It will take three months to carry out this rigmarole. Material objects and not processes are protected. It is said that "this feature is due to the efforts of the manufacturers of aniline colors and chemicals, whose interests would be injuriously affected by a law as comprehensive as that of the United States, which protects 'useful arts' and 'compositions of matter,' as well as tools and machines."

The Chartiers Valley Gas Company.

In a very interesting report by George E. Mann, city engineer of Buffalo, growing out of the natural gas explosion in St. Paul's Church, in that city, an account is given of a visit to the Chartiers Valley Gas Company, of Pittsburgh. At the wells the connection with the main line is made in the following manner: The casing that is put in the well at the time of drilling to wall out water from the rock seams extends up to the derrick floor, a branch is bolted to this casing, having one of its outlets pointing straight up the derrick and the other going off at the side at an angle of 45°. Upon each of these outlets, which are 6 inches in diameter, a gate valve is bolted, the gate valve on the upright branch having a pipe bolted to it to conduct the gas to the top of the derrick in case it is necessary to blow off the gas. From the valve on the branch pipe a curved pipe is bolted, which leads into a tank placed near the well to separate and collect any water or oil that may be carried along with the gas as it leaves the well. A safety valve is placed on top of the tank. All the fittings used about the wells are enormously heavy, so as to withstand the great pressure of the well when shut in. The first line laid was 8 inches in diameter, wrought iron screwed joints. In 1885 a second 8-inch line was laid from the Murrysville field, a line 6 inches larger than any line laid from any gas field. The following season this company laid a 12-inch wrought pipe line from the new Glenfield gas field. These three different gas fields are in different directions from Pittsburgh and Allegheny City and about equidistant, being about 16 miles. The largest line in the world for conveying natural gas was laid by this company and finished last October. It runs from the northern Murrysville gas field to Pittsburgh, a distance of about 20 miles. The first 8 miles, beginning at the wells, is 16 inches in diameter. It is then increased to 20 inches for a distance of 6 miles; at the end of the 20-inch a 24-inch begins, and extends 5 miles through the city. The pipes are, excepting the 24-inch, of wrought iron, 1½

welded seams and converse patent joints, the largest lap welded pipe ever made.

The Chartiers company have a total of 479,258 feet of high pressure lines. As the gaspasses through the city it enters regulating stations, where the pressure is reduced, a higher pressure being carried on the lines from the wells to the city than within the city. From 15 to 20 pounds per square inch is the pressure within the city on the so-called mill supply line. It is located principally along the Allegheny River near the shore, where all the large mills are located. It crosses the Monongahela river by six 10-inch lines, and is connected into the South Side mill supply system; on this side of the river are also reducing stations; the total number of feet of high pressure or mill supply lines in Pittsburgh and Allegheny owned and operated by this company is 148,693. These lines are ventilated with what is known as the "patent separate pipe escape system." It consists in placing a sleeve over every joint in the gas line; this sleeve is made perfectly gas tight around the pipe by means of lead or other suitable materials; on the inside of the sleeve a space or chamber is left where all the gas that escapes from the joint is collected; connected with this chamber at the top a small pipe leads off and up to a lamp-post at the curb line. The escape-pipe that leads away from the joint is marked with a corresponding number at the top of the lamp-post, so if gas is discovered escaping, by noting the number of the small pipe through which it escapes the exact location of the leak can be determined, as each joint in the main line is numbered, and its exact distance measured from the lamp-post. In addition to the above system the top of the pipes are covered with broken stone to a height of 9 inches also on the branch lines to the lamp-posts. Over the broken stone is laid a sheet of tar paper, and the earth filled in on top. by this means if any gas should escape from defective joints or the body of the pipe, it will follow this blind drain and up the lamp-post to the open air.

The house supply system of this company is the same as in operation here in Buffalo—that is, large mains and low pressure rather than high pressure and small mains. On this point Mr. Hartupsee says: The Chartiers company lay pipes to supply the private houses so large that a pressure of 4 or 5 ounces only need be and is carried in them. The service-pipes are then run direct into the consumer's house, no regulating or other device being necessary, as the pipes themselves carry no greater pressure than is required in the houses. The question may be asked, "Are not the valves that control the pressure between the mill and the house supply lines liable to get out of order and let a higher pressure into the house than would be safe?" We answer, "Yes, but of these valves there are in the two cities but eight, and perhaps will be never more than 12, and to watch them the company keep watchmen night and day, whose duty it is to see that these valves are always in order. In the Buffalo system there is attached to these valves a safety device on the principle of a gasometer, further mention of which is made in this report.

"Now, in the first system there are valves designed for the same purpose used between the mill and the house-supplying lines which we grant can be kept in order, the same as our company keep theirs; but in addition to this there are thousands of these same kind of valves scattered in cellars and out-of-the-way corners all over the two cities, and few persons would say that these thousands of valves can be examined every day as they should be to be certain that they will work when called upon. Our company have 20 miles of house-supply lines in the city of Pitts-

burgh and eight miles in Allegheny. We have over 100 miles of private wire for telephone and telegraph service, besides being connected by means of the central telegraph station to various other stations belonging to the company in the two cities. Watchmen are stationed along the lines night and day. At each of the stations gauges are connected with the line and the pressure at all stations is sent to the main city office every hour and from this office the pressures are regulated."

Definition of the Contract Labor Law.

The Secretary of the Treasury has sent a communication to the Secretary of District Assembly No. 46, K. of L., Buffalo, N. Y., in which he defines the effect of the act on aliens residing in adjoining foreign territory, and under what circumstances prohibited from entering the United States. The communication says: "In answer to your letter, propounding certain questions relative to alien laborers, you are informed that, under the provisions of the act of February 23, 1887, prohibiting the importation of foreign laborers under contract, it is not necessary that the contract be in writing, signed by the parties, to render the person hiring or engaging such laborers liable to the penalty provided in section 3 of the act. An oral contract is sufficient, or, as expressed in the act, any 'contract or agreement, parol or special, express or implied, made previous to the importation or migration of such alien,' &c. By reference to the letter of the acting secretary of May 16, 1887, on the same subject, addressed to the Hon. John B. Webber, cited in your letter, you will observe that you are mistaken in regard to what is there stated as to the kind of contract forbidden by the act.

"Section 1 of the act referred to makes it unlawful for any person, company, partnership, or corporation in any manner to prepay the transportation, or in any way assist or encourage the importation or migration of aliens into the United States, under any contract or agreement made previous to the importation or migration of such aliens.

"If the circumstances under which an alien laborer enters this country are such as would lead the courts to find that there was an implied contract between him and his employer previous to his entry, a case would seem to be presented of a violation of the provisions of the act, which would not be affected by the retention of his residence in the foreign country and his daily return to his home. And if an alien residing in adjoining foreign territory and retaining his residence there enters this country without having previously made any contract to labor here, and after such entry contracts to labor, and while such contract is in force returns to his home in the foreign country and again enters for the purpose of performing the contract and pursuant to its terms, the latter entry, being under a contract previously made to perform labor in this country, would seem to be prohibited."

Riehle Bros., proprietors of the Machine and Testing Machine Works, Philadelphia, have secured the services of the new firm of the Robert W. Hunt & Co. Bureau of Inspection, Nos. 631 and 633 "The Rookery," Chicago, to represent them in the testing machine branch of their business in the Northwest.

The Reading Railroad Company want the City of Philadelphia to pay \$3,000,000 toward defraying the costs of the proposed terminal improvements in that city, which have for their principal feature the raising of the tracks, thus doing away with grade crossings.

Triple-Expansion Engine Cylinders.

The proportions of cylinders of triple-expansion engines adopted by different builders vary very considerably. The variation is greater even than that which obtained generally with the compound marine engine. The proper proportions of the cylinders depend to a considerable extent on the total ratio of expansion adopted, and the latter depends on the steam pressure employed. It is interesting to note the very wide discrepancy in the dimensions of cylinders adopted for the same boiler pressure by various English builders. In one instance a Clyde, Scotland, firm, working with a 150-pound boiler pressure, use a ratio of low-pressure cylinder to high-pressure of 6.7; while a firm in Hull, for the same pressure, adopt in one case a ratio of 8, and in others 6.2 to 6.8. In the case of the steamship Aberdeen the boiler pressure is 115 pounds, and the ratio of high-pressure cylinder to low-pressure cylinder is 5.4. With 140-pound boiler pressure, one eminent firm adopts a ratio of 6.1, and another, with boiler pressure of 135 pounds, makes the ratio of 6.4. Of course some variation in practice is to be expected, but they cannot all be right. In working out the powers of the triple-expansion engines theoretically, practice seems to point to about 15 pounds absolute as the best terminal pressure to assume. The absolute initial pressure divided by that number gives the best ratio of expansion to adopt under most circumstances. With such data the average mean pressure referred to low-pressure cylinder approximates to about one-fifth of the boiler pressure in practice. From this data it is easy to arrive approximately at the diameter of low-pressure cylinder required for a given horse-power and boiler pressure. The size of this cylinder does not give rise to much variation in practice. The diameters, however, of the high-pressure and intermediate cylinders vary considerably according to the opinion of various engineers. With the three-crank engine the object should be to obtain as nearly as possible equality of power and stresses in the three cylinders, with equality in the ranges of temperature. As with the compound engine, so with the proportioning of triple expansion engines—some builders exhibit a good deal of rule-of-thumb work, which does not indicate that they have rationally solved the problem of what they turn out in practice. The best ratios, however, and something like uniformity of practice under similar conditions should be sought for.

A Prosperous Copper Mine.—The advance official summary of the Tamarack Mining Company, for the fiscal year ended June 30, is at hand, and shows remarkable progress in 12 months. When the second shaft is completed, another great stride forward will be in order. The statistics for the year compare as under with the previous year:

	1887-88.	1886-87.	Increase
Product, mineral, lb. 13,007,234	6,282,119	7,375,115	
Per cent. fine copper	78.36	74.40	1.96
Product fine copper, lb.	10,389,867	5,539,521	5,750,346
Gross receipts	\$1,448,944	\$474,615	\$974,329
Expenses	567,259	380,582	218,657
Profit	881,705	94,032	787,673
Profit per lb.	8.058c.	2.04c.	6.018c.
Construction	\$150,886	\$194,187	\$43,301
Dividends	120,000		120,000
Balance assets	606,164	25,445	580,719
* Decrease.			

The cost of mining in the last year was 3.97 cents, the cost of copper delivered in New York was 5.75 cents per pound; price received, 13.86 cents per pound. For April, 1888, the cost per pound at New York was 6.60 cents, and in December, 1887, it was 5.03 cents. The price received ranged from 10.71 cents in July, 1887, to 16.21 cents in February, 1888.

The Pud weighs 36 $\frac{3}{4}$ lb American.—*Journal de St. Petersburg.*

EAST INDIES.

PENANG, July 7, 1888.—*Tin*.—Receipts since the 22d ult. reached 8000 piculs, of which Europeans took 3000 and Chinese 4000. Prices for Larut Tin opened at \$30.40 $\frac{3}{4}$ picul and rose to \$30.55, while Europeans began to procure other sorts, which caused a decline in the former to \$29.31 to recover to \$33.40, at which Chinamen remain buyers. Europeans confine their buying to Larut Tin. Receipts from the interior remain moderate.—*Schmidt, Kustermann & Co.*

MANILA, August 13, 1888.—*Hemp*.—There are buyers at \$10.12 $\frac{1}{2}$, against \$9.87 $\frac{1}{2}$ $\frac{3}{4}$ picul same date last year, equaling respectively £53. 10/ and £53. 4/6 $\frac{3}{4}$ ton, cost and freight. There have been no clearances for the United States during the week, whereas last year 5000 bales were cleared; since January 1 they amount to 99,000 bales, against 138,000 last year, while there are loading 10,000, against 16,000. The clearances for England since January 1 have been 221,000, against 137,000, and there remain loading for the same destination 12,000, against 8000. Cleared for all other ports, 46,000, against 26,000; receipts at all ports since last cable, 17,000, against 4000; do, since January 1, 363,000 bales, against 287,000

last year and 241,000 in 1886. *Freight*, \$6, against \$6. *Exchange*, 3/5 @ 3/5 $\frac{3}{4}$. *Silver Coinage*.—At a meeting of Spanish and other merchants it was resolved to petition the home Government, in view of the depressed rates of exchange, to cause Silver dollars to be coined for circulation in this colony, of the fineness of 9/10, and thenceforward treat Mexican dollars merely as if they were Bar Silver.—*Ker & Co. to Charles Nordhaus, New York, per cable direct.*

SPAIN.

BILBAO, July 21, 1888.—*Iron Ore*.—Since the 21st ult. only a few single cargoes have been taken for export at 6/10 @ 7/3, Rubios, and 7/6 @ 8/, Campanil, the shipments amounting to 72,943 tons the first week, and to 67,774 the last week. The total shipments since January sum up 2,276,674 tons, against 2,676,033 tons same time last year. *Pig Iron*.—The export has during the fortnight not exceeded 300 tons, while coastwise 1607 tons have left our harbor. To-day's quotations for Pig Iron f.o.b. $\frac{3}{4}$ ton here are 60 pesetas or francs. Spot, Nos. 1 to 3, and 57, Nos. 4 to 6; Futures may be quoted 58 and 55 respectively; Lingotillo at Huelva or Seville, 65.—*Bilbao Marítimo y Comercial.*

GERMANY.

HAMBURG, August 4, 1888.—*Iron*.—The Pig Iron market is as dull as ever, including Spiegel, which remains 56 marks $\frac{3}{4}$ ton, 10 to 12 $\frac{3}{4}$, without an export demand. Forge Pig is depressed; at Siegen it is selling for 47 @ 48; orders reach to the middle of October. Luxemburg may be quoted 38.70 @ 40 marks. All other Pig remains quiet and unaltered. Finished Iron has become slightly livelier for Domestic, but the export is positively extinct. Machine shops, foundries and car manufacturers are all doing well in Rhenish-Westphalia. Bessemer Steel Billets are quoted 135; Wire Rods, 120 @ 121; Steel Rails, 115 @ 120. After English Rail-makers shall have agreed, the negotiations for a renewal of the International Steel Rail syndicate may be resumed. Frederick Krupp, of Essen, sold the Andalusian railroads 14,000 tons at 113 francs laid down at Cadiz, while the French St. Chamond Steel Works asked 126 francs. While the outlook in the Iron trade in Westphalia is anything but encouraging just at present, Upper Silesia has no fault for complaint, even in the Wire branch it has not. Export of Iron, Hardware and Machinery from Germany the first six months:

NEW PUBLICATIONS.

THE CHEMICAL ANALYSIS OF IRON.—By Andrew Alexander Blair. J. B. Lippincott & Co., Philadelphia. Price, \$4.

Mr. Blair is too well known as a metallurgical chemist and as one of the leading contributors to the literature of his particular branch of science to need an introduction to the iron trade. His summary of methods published in connection with his work on the Tenth Census will be particularly remembered. Since then an army of progressive young men have been busy in our chemical laboratories, steadily perfecting and simplifying methods. It is their work as well as his own that Mr. Blair has gathered in a comprehensive treatise, which will prove invaluable to the beginner and will be of much service to even the most experienced. Naturally the bulk of the work is descriptive of Mr. Blair's own practice, supplemented by assistance and suggestion from some of our leading iron works' chemists, and by a critical study of the mass of scattered literature in which others have put their experiences on record. The work is thorough, without being too elementary. It is naturally subdivided into one part which deals with apparatus and reagents, a second descriptive of the methods used in the analysis of pig iron, bar iron and steel, taking up necessarily

sulphur, silicon, slag and oxides, manganese, carbon, titanium, copper, nickel, cobalt, chromium, aluminium, arsenic, antimony, tin, tungsten and vanadium. The third part deals with the analysis of iron ores and the fourth with the analytical work connected with the materials of the stackhouse and the analysis of gases. Mr. Blair's is a standard work which will prove the chief guide of the young chemist and a frequent guide to more experienced analysts. There is one suggestion which we would like to make, since we believe that it would be prized by beginners, and that is a more frequent statement as to the time which different methods require in the hands of a skilled analyst. Mr. Blair refers to this point repeatedly, but we know how much aid it is to a beginner to be able to check his progress in this respect by that of his seniors, especially when he is located where personal conferences with them are out of the question.

TREATISE ON PATENT ESTATE.—By Thomas B. Hall. Published by Ingraham, Clarke & Co., Cleveland, Ohio. 12 mo. Law binding. Price, \$3.

Mr. Hall's work grew out of the accumulation of notes, made for personal use, on features of the patent law which have remained comparatively undeveloped. In a series of chapters Mr. Hall deals with the objects of our patent system, with their property right and its profits, and their partition. He takes up the questions arising from the accounts between part owners, the infringement between part owners and the limitations of sectional grants. After quoting the cases, Mr. Hall ends his chapters with a brief summary of conclusions. An appendix gives a number of leading opinions not in technical patent reports. Although written strictly from the standpoint of a lawyer, manufacturers, inventors and business men will find a study of the work valuable, and reference to it will guide in determining questions often perplexing to these not versed in law.

STEAM HEATING. An Exposition of the American Practice of Warming Buildings by Steam. By Robert Briggs, M. I., C. E. 122 pages. Size 4 x 6 inches. Published by L. Van Nostrand. Price 50 cents.

The valuable little book before us is numbered 68 in the Van Nostrand Scientific Series, and this much description will, in a general way, inform our readers what the volume is like so far as appearance is concerned. The part by Mr. Briggs occupies 70 pages of the book, the remainder, or addendum, being written by Alfred R. Wolff, M. E., and contains some empirical data on steam heating. The steam-heating portion is reprinted from the "Proceedings of the Institute of Civil Engineers," and was prepared, presumably, for the purpose of informing English readers concerning the practice of steam heating in this country. The article opens with a brief historical review of the practice, after which some 20 odd pages are devoted to wrought-iron welded tubes and couplings, the subject being fully treated with the aid of tables and formulæ. The subject of boilers is very briefly noticed and treated only in a general way. The theory of the circulation of steam follows, and some remarks are added on the clothing of steam mains. Steam stop valves are illustrated and described and the remainder of Mr. Briggs' work is devoted to radiators, their use and construction. The appendix by Mr. Wolff contains data in the shape of tables and formulæ that will prove of special interest to those who investigate the subject of steam heating from a theoretical standpoint and who are not afraid to handle mathematics. A table at the end giving chimney and boiler proportions, which was prepared by Mr. William Kent, possesses considerable value for those who do large steam-heating jobs.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, August 20, 1888.

Pig Iron.—Business fell off somewhat during the past week, but it has been far from dull. In fact, some furnace agents have found a better demand for their iron than during the previous fortnight. The withdrawal of a number of furnaces from the market in consequence of the sale of their entire product for months to come has given others a better opportunity to secure orders. Buyers being now restricted as to brands, an improved feeling is noticed among sellers and the upward tendency in prices is more decided. Some of the favorite Soft Irons have been marked up 50¢ per ton in the past week, and the others will soon follow, if the present demand continues. The large consumers of Lake Superior Charcoal have not all bought, and heavy transactions are yet to come in this line, which causes prices to be held firmly at the advance made last week. Although some brands of Lake Superior Coke are still available at old figures, sellers of competing brands state that orders are being secured with little difficulty at considerably higher prices. Southern Coke Iron has been freely sold at outside quotations. We quote for cash as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers \$19 @ \$20; Alabama Car-Wheel, \$26.25; Southern Charcoal Foundry, No. 2, \$18 @ \$19; Jackson County Softeners, No. 1, \$18 @ \$18.50; Hocking Valley, Soft Foundry, No. 1, \$17 @ \$18; American Scotch (Blackband) No. 1, \$18.50 @ \$19.50; other Ohio Scotch Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$17 @ \$18; No. 2, \$16 @ \$17; No. 3, \$15 @ \$16; Southern Coke, No. 2, \$17 @ \$17.50; No. 2½ and Open Bright, \$16.50; No. 3, \$15.50 @ \$16.

Bar Iron.—Large orders are still in the market, and the condition of trade continues to improve. So many mills now have all the orders they care to take, and the price of raw material shows such a decided upward tendency, that the mills now in the field are asking higher prices. Manufacturers in the Mahoning Valley are naming 1.57½¢ at mill, half extras, as their bottom rate, and some of them have instructed their agents to take no orders, even at this figure, without first submitting them for approval. Prices for carload lots, at Chicago, range from 1.67½¢ to 1.70¢, half extras. The advance in prices is enabling some mills to secure orders which have for a long time done no business here because of their refusal to meet the low rates prevailing. Jobbers are showing their confidence in the maintenance of the advance which has been established by stocking up quite freely. They quote 1.80¢ @ 2¢ from store, according to quantity and quality.

Structural Iron.—Bridge material has been in much better demand than for some time, and manufacturers are advancing prices. Mill lots are quoted as follows, f.o.b. Chicago: Angles and Universal Plates, 2.30¢; Tees, 2.45¢; Beams, 3.40¢. Store quotations are held at 2.40¢ @ 2.70¢ for Angles; 2.60¢ @ 2.90¢ for Tees; 3.80¢ for Beams and Channels.

Plates, Tubes, &c.—No large transactions are reported in Plates, but a brisk trade has been done in the usual store lots. The mills have advanced their prices for Tank Iron, but dealers here have not changed the store quotations, although they will be obliged to do so when present contracts expire if the advance by the

mills is maintained. Tubes are firmer: Store prices are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 % and 10 % off on 2½-inch and larger and 62½ % off on 2-inch and smaller

Sheet Iron.—The condition of this branch of trade continues as reported last week, much inconvenience being experienced among jobbers who are unable to get the Sheet Iron for which they have placed contracts. The few mills which are not fully sold up are profiting by this state of affairs, having found numerous buyers willing to pay from 3¢ to 3.05¢, f.o.b. Chicago, for No. 27. Jobbers' prices for small lots are 3¢ for No. 24, 3.10¢ for Nos. 25 and 26, and 3.20¢ for No. 27.

Galvanized Iron.—Manufacturers' agents report a very perceptible improvement in the demand, orders being distributed over all classes of consumers. Prices are well maintained, concessions being less frequent than in previous weeks. Small lots continue to be quoted at 60 % and 5 % off for Juniata and 60 % and 10 % off for Charcoal.

Merchant Steel.—Manufacturing consumers have placed large orders during the week. Plow manufacturers have been very liberal purchasers at the prices fixed by the makers of syndicate Steels. Store trade keeps quite active, with probably a little less demand for the highest grades. Quotations from store are as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢. Good orders for Rake Tooth Steel have been taken at 7½¢ @ 8½¢.

Steel Rails.—Some slight indications of an improvement in business are perceptible, which the manufacturers hope will develop into a more pronounced condition of healthfulness before long. Orders are known to have been placed during the week for round lots of Steel Rails, but the exact quantity and terms have not been disclosed. Inquiries are coming in a little more freely, and the prospects are quite encouraging at present writing. It is true that the North Chicago Rolling Mill Company have shut down their Rail mill for lack of orders, but the stoppage is expected to be of short duration. Quotations are nominally \$31 @ \$31.50, but they will be shaded for desirable orders.

Old Rails and Wheels.—Sales of Old Iron Rails are reported at \$20.50. They are very scarce, however, and inquiries are numerous, and it is probable that no considerable quantity could be had at even \$21. Cleveland parties state that an offer of \$23 has been refused by holders of a stock of Rails at that point. Old Steel Rails are wanted at about \$18.50 for long lengths, free from Frogs, &c. Old Car-Wheels are also scarce, and nominally quoted at \$19 @ \$19.50.

Scrap.—A better movement is noted in this material. Sales of Forge have been made to some extent, but there have been large transactions in Mill. Borings and Turnings are in good demand. For Cast there is some inquiry, but sales are slow. The higher grades of Steel Scrap are moving off, but Mixed Steel is not wanted. Dealers are now offering \$13 @ \$14 for Mixed Country Scrap. Selling quotations for carefully selected are as follows, per ton of 2000 lb: No. 1 Forge or Railroad Shop, \$18 @ \$18.50; Track, \$17 @ \$17.50; No. 1 Mill, \$14.50 @ \$15; Light Wrought,

\$9 @ \$10; Horseshoes, \$18; Axles, \$28; Cast Machinery, \$14; Stove Plate, \$10.50 @ \$11; Cast Borings, \$9; Wrought Turnings, \$10 @ \$11; Axle Turnings, \$12.50 @ \$13; Coil Steel, \$14 @ \$15; Leaf Steel, \$16 @ \$16.50; Locomotive Tires, \$16.50.

Hardware.—Jobbers of Heavy Hardware are having a good demand for their specialties. The stiffening tendency in Iron has imparted a feeling of greater confidence to the trade, and they look forward to a very satisfactory fall season. The proposed combination of manufacturers of all articles entering into the construction of Wagons and Carriages has incited the jobbers to take measures to protect their interests, which are alluded to at length in another part of this issue. The Shelf Hardware trade is in very good shape, and the outlook is improving every day. The usual seasonable goods are moving very freely, while for staple articles a continuously good demand is being experienced. In consequence of the advance in Pig Tin the price of Solder has been marked up 2¢ per lb, to 15¢. As Pig Lead is also dearer the price of Shot has been raised 5¢ per sack, to \$1.30. Collections are light at present, but this is usual in August.

Nails.—At last Nails seem to have touched bottom. Heavy sales have been made by manufacturers' agents to the merchants, who were apparently convinced that lower prices could not be expected. It is stoutly asserted that it is no longer possible to secure Steel Nails at the lowest rates which were current last week. An effort is on foot to make \$1.90, f.o.b. Chicago, the bottom price for large lots from factory. Inquiries are numerous, and appearances now indicate a season of activity for the Nail manufacturers. Small lots are quoted by jobbers at \$2 for Steel Nails and \$2.50 for Wire Nails. A meeting of Western Wire Nail manufacturers will be held at Cleveland to-morrow (21st) to devise some means of improving the condition of that branch of trade.

Barb Wire.—A little improvement is noted in the demand, but prices are unchanged. Jobbers quote 3¢ for Painted and 3.75¢ for Galvanized, in small lots.

Pig Lead.—Continued heavy transactions are reported, purchases made being almost entirely for consumption. The total volume of business for the week is estimated at 900 to 1000 tons at prices ranging from 4.25¢ to 4.32½¢, easing off at the close to 4.30¢, in sympathy with advices of lower prices in the East. Brokers state that a little reaction would not be surprising after so sharp an advance, but they claim that any reaction will only be temporary.

The Ashland Furnace, at Ashland, Wis., went into blast again to-day. It makes the Hinkle brand of Lake Superior Charcoal Iron, for which Rogers, Brown & Co. are agents. Over one-half of its anticipated product for this blast has already been sold.

Charles O. Hale, 34 Wabash avenue, Chicago, has made arrangements to succeed H. F. Lockwood as Western correspondent for Hammond & Lobdell, of New York, in the Tin-Plate and Metal brokerage business. Mr. Hale is not new to the trade, having represented E. S. Wheeler & Co., in Chicago, previous to the failure of that house.

The freight rate on scrap iron from Chicago to Pittsburgh has been reduced to \$2 per ton in consequence of a fight between competing railroads. A week previously the rate was reduced to \$1.85 per ton to Mahoning Valley points for the same reason.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., August 21, 1888.

Pig Iron.—The market is a little quiet, but is not materially different from what it was a week ago. Buyers seem comparatively indifferent in regard to placing orders for forward delivery, however, and the general feeling is that prices are about as high as they are likely to be for some time to come. Business is not what can be called bad, when the week's transactions are averaged up, but there is a lack of buoyancy which is discouraging to those who have been looking for steady improvement. There is no retrogression, however, so far as prices are concerned, although there is some little falling-off in the demand and in view of the expected increase in the output during the later months of the year, consumers are disposed to take their chances rather than place orders at the prices usually demanded for late deliveries. But the offerings are not large, and the current demand for small lots in connection with deliveries on former contracts, entirely prevents anything like accumulation. Hence there is no apparent reason for expecting anything in the market different to what we have had for some weeks past. A good deal will depend probably upon crop prospects, and until they can be fairly estimated it is hard to say in which direction the market will move. Reports from Iron centers West and South are decidedly favorable, and for the present little or no competition is met with from those points. The prospective increase in the output, however, may perhaps again change the current, unless it is offset by increased consumption, which, to say the least, is somewhat doubtful. But as regards this particular market, the feeling is certainly not very buoyant, and it may well be doubted if anything like large lots could be placed without making some concessions in buyers' favor. Good brands, as already stated, are in very moderate supply, but of one kind or another there is a good deal of Iron for sale, and to that extent the position is less favorable than it was two or three weeks ago. Prices remain steady at \$18 @ \$19 at tide for No. 1 Foundry; \$17 @ \$17.50 for No. 2, and \$15.75 @ \$16.25 for Gray Forge. Southern Iron could be had at 50¢ @ \$1 below these figures, but there is no demand for it unless further concessions are offered. Agents are watching their opportunity to secure business, although in the meantime markets elsewhere appear to offer better inducements than those around Philadelphia.

Foreign Iron.—No business transpiring, buyers and sellers being unable to come together. Asking prices are about \$19.50, c.i.f., duty paid, for Bessemer, and \$26 @ \$26.50 for 20 % Spiegel.

Blooms.—Steel Blooms are moderately active, one lot of 10,000 tons of Nail Slabs having been sold by a Pennsylvania mill, besides various sized lots of Billets at about quoted rates, although on large lots special terms have been made. Quotations about as follows: Nail Slabs, \$28.50 @ \$29.50; Billets from \$30 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 per "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29 @ \$30 for Nail Slabs; \$31.50 @ \$32.50 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—There is a continued good demand, and prices are firmly maintained. Sales chiefly at \$27.50 @ \$28, delivered, holders now being somewhat firm at the outside quotation.

Bar Iron.—There is nothing to indicate any special change in the position, as compared with last week. The demand is fair, some of the mills report plenty of work, while others find it difficult to run more than half or two-thirds time. Prices are unchanged, and so irregular that they are hardly quotable. Some get 1.85¢ @ 1.98¢ for all they sell, while others are anxious for business at 1.75¢ @ 1.8¢. It is possible that there may be all the difference in quality, but large buyers claim that they can secure a perfectly satisfactory article at the inside figure, although for special brands they may have to pay more. The demand is chiefly for small lots, however, and so far as we can learn none of the mills are accumulating orders for more than a very short time ahead. Skelp is in good demand, and is helping some of the mills considerably. Orders are still on the market for good-sized lots, and will probably be taken at about 1.8¢, although some of the mills are trying to get a slight advance on that figure.

Plate and Tank Iron.—The past week has not developed any improvement in this department, although there is a pretty fair demand for small lots. Mills have not much work ahead, however, so that there is a good deal of competition to secure what little business is offered, and prices are kept at the low figures ruling during the early summer months. There is nothing important in sight, and it is to be feared that the present condition of things will continue for some time yet. Prices for small lots about as follows: Ordinary Plate and Tank Iron, 2¢ @ 2.10¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—The market is dull and mills are getting very little new business. Architectural work keeps up fairly, and there is a good deal in the way of finishing up bridge and elevated work, but apart from that the outlook is not encouraging. Prices about as follows: 2¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The market is not specially active, although sales keep pretty well in line with the output. Prices are irregular, depending a good deal on quantity, requirements as to quality, &c. The best makes command about the following prices for the ordinary run of orders:

Best Refined, Nos. 26, 27 and 28....	3¼ @ 3½¢
Best Refined, Nos. 18 to 25.....	3 @ 3¼¢
Common, ½¢ less than the above.	
Best Bloom Sheets, Nos. 26 to 28....	4¼ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25....	4 @ 4¼¢
Best Bloom Sheets, Nos. 16 to 21....	3½ @ 3¾¢
Blue Annealed.....	2.8 @ 3 ¢
Best Bloom, Galvanized, discount.....	62½ ¢
Common, discount.....	67½ ¢

Merchant Steel.—Manufacturers report a largely increased demand, more particularly in Tool Steel, and state that the general condition of the market is favorable. Prices for small lots are quoted as follows: Tool Steel, 8½¢; Machinery, 2½¢; Crucible Spring, 4½¢; Open-Hearth Ordinary Spring, 2½¢ @ 2½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—There is very little doing in the market, although prices are a shade lower, say \$28.50 @ \$29 at mill for such deliveries as are convenient to the seller. Deliveries for September or October would probably command a slight premium, as mills are pretty well filled up for the next two months, but beyond that the outlook is not encouraging.

Old Rails.—Owing to the scarcity of spot lots, very little business has been done in this market of late, although there are indications of a desire to place

orders by large consumers. Bids of \$20.50 @ \$21 could be had for late shipments, but there appears to be very little stock available at those figures.

Scrap Iron.—Small lots sell at quoted rates, and some inquiry is made for late shipments, but the prices offered are too low to permit of much business being done. Ordinary quotations about as follows: \$18 @ \$19 for cargo lots; \$20 @ \$21 for carload lots, delivered, or for choice \$21.50 @ \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$19 @ \$20; Cast Scrap, \$14 @ \$15; do. Borings, \$9 @ \$10; Old Fish Plates, \$24 @ \$25. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—A number of large orders have lately been received from parties interested in the natural gas industry, influenced, no doubt, to a certain extent, by the low prices now ruling. But with an increased demand, and the various departments full, the mills will be in a better position to advance prices later on. Discounts as follows: Black Butt-Welded, 55 %; on Galvanized do., 45 %; on Black Lap-Welded, 65 %; on Galvanized do., 52½ %; on Boiler Tubes, 60 %.

Nails.—No sign of improvement is as yet apparent in this department. The general apathy of the past two months continues, with little prospect of any immediate activity. Prices from store are quoted at \$2 @ \$2.05, carload lots at \$1.90, and in some cases less than this has been accepted.

Cleveland.

CLEVELAND, August 20, 1888.

Iron Ore.—Non-Bessemer Ores, either Hematites or Menominees, can no longer be bought for less than \$4 per ton. Gogebic Bessemer are in good demand at \$5, with but very few offerings. An especially valuable lot of about 8000 tons sold during the week at \$5.15, f.o.b. cars Cleveland. Menominee Bessemer, if not too high in phosphorus, bring \$5 readily. Many demands for Ore have been declined during the past ten days, the mine owners not being inclined to dispose of a quantity of Ore beyond their ability to mine. An inquiry for 15,000 tons from a particularly valuable mine in the Gogebic district was ignored, because of the belief that the contemplated output did not warrant further sales. If the present brisk demand could have been foreseen three months ago arrangements would undoubtedly have been made for an increased production at nearly all the ranges. Freight rates are slowly advancing, the Escanaba rate having risen from 83¢ four weeks ago to \$1.05, and the Marquette rate from \$1.05 to \$1.30. The lake shipments of Ore to date slightly exceeded 2,150,000 tons. If the all-rail shipments are added, the total is 2,325,000 tons, as against 2,575,000 tons up to a corresponding period last year. The lake shipments by districts in round numbers have been: Marquette district, 825,000 tons; Gogebic district, 635,000 tons; Menominee district, 540,000 tons; Vermillion district, 160,000 tons.

Pig Iron.—The encouraging features noticeable during the past three or four weeks continue, and the tone of the market is daily becoming firmer. Mill Irons are in very good demand at an advance of 50¢ per ton over former quotations. No. 1 Foundry Iron is also held at an advance, and an upward tendency is discernable everywhere. The belief that the market cannot much longer remain stationary, and that substantial advances will soon be made in quotations for all marketable Iron, seems universal.

Scrap Iron.—A few sales of Wrought Scrap at figures said to be below \$17.50,

but closely guarded, are reported. Old American Rails bring \$20.50, and Old Wheels \$18.75.

Cincinnati.

CINCINNATI, August 20, 1888.

Pig Iron.—Confidence is the feature of special prominence in the local Pig-Iron market. The volume of business during the past week has been only moderate, and there has been no further advance in prices, except in special instances, which are no criterion of the general market. The higher prices established during the past month, however, have been fully sustained, and the outlook is favorable for an additional advance of moment. Furnaces with full order-books are very independent, at least for the present, and will only accept new business when accompanied by offers to pay a further advance for favors received. Buyers continue to make frequent inquiries, but the attitude of sellers repels rather than encourages them. Intelligent consumers, however, are not slow to buy when a favorable opportunity offers, they recognizing the strength of producers' positions at the beginning of an active season. Furnaces place much reliance in the report that consumption is at present about 1000 tons per day in excess of production, but the latter is said to be slightly increasing. Cincinnati firms have made few, if any, 1000-ton sales during the week of either Foundry or Mill grades, but there have been several 500 and two 600-ton lots sold, and a number of car-load transactions. The aggregate for the week is doubtless between 8000 and 10,000 tons. No. 2 Southern Foundry Iron has been sold, delivered in New York, at about \$18, cash, here; No. 2 Southern Mill is quotable at \$14, and No. 1 has been sold equivalent to \$14.50 @ \$14.75, cash, here, mainly at the outside rate. Silver grades have sold at about \$16.75 and Medium Bright Iron at \$14.75 here. Moderate sales of Southern Car-Wheel have been made at \$24.50, cash. Lake Superior Iron is in light supply. Mill iron continues to be relatively more difficult to obtain than Foundry grades. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$17.00 @	\$18.00
Southern Coke, No. 2.....	16.00 @	16.50
Southern Coke, No. 3.....	15.00 @	15.50
Ohio Soft Stone Coal, No. 1.....	17.00 @	17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @	16.00
Mahoning and Shenango Valley.....	16.50 @	17.00
Hanging Rock Charcoal, No. 1.....	20.50 @	22.50
Hanging Rock Charcoal, No. 2.....	19.00 @	21.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @	18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @	17.50

Forge.

Strong Neutral Coke.....	14.00 @	14.50
Mottled Neutral Coke.....	13.00 @	13.50
No. 1 Mill Coke.....	14.50 @	14.75
No. 2 Mill Coke.....	14.00 @	14.25

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @	23.00
Hanging Rock, Cold Blast.....	22.00 @	25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @	21.00

Manufactured Iron.—There has been a fair degree of activity in all kinds and the market has improved in tone, without change in prices. Common Bar Iron, 1.90¢ @ 2¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3½¢ @ 4½¢ @ lb.

Nails.—The market has ruled steady under a fair jobbing demand and an ample supply. Jobbing prices are based upon 12d @ 40d, which sell at \$2 @ keg, with 10¢ rebate in carload lots, at mills; 50d @ 60d, 25¢; 10d, 10¢; 8d @ 9d, 25¢; 6d @ 7d, 40¢; 4d @ 5d, 60¢; 3d, 1¢, and 2d \$1.50 per keg more. Steel Nails sell at \$2 and Steel Wire Nails at \$2.65 @ \$2.75 @ keg.

Old Material.—The demand for Old Rails has further increased and prices have advanced \$1 @ ton. At the close there are buyers here at \$21 @ ton, but none are offered, except at far-off points. There has been but little inquiry for Old Wheels, which are nominally quotable at \$19, cash, here.

Louisville.

LOUISVILLE, KY., August 18, 1888.

Pig Iron.—The price of Iron has advanced during the past week 50¢ a ton, and buying has been general. Furnaces, however, have not been willing to sell for deliveries extending longer than January in most cases. It is more difficult to obtain Iron than to effect sales, as on inquiry for large lots of Iron it is found that Southern furnaces are not in position to sell for prompt shipment and not disposed to make sales for deliveries extending beyond the year. Silver Gray Iron continues very scarce, and parties holding the Iron are able to get their own price. This movement has been caused by buying in the West, especially in Chicago and St. Louis, as the Eastern market remains firm, with but a slight tendency upward. The present advance first started in the East and was followed by Cincinnati and Louisville. Other Western buyers, feeling that the market could not improve, were not willing to pay better prices than they had been paying for the past three months. However, a change has occurred during the past week, and at present Chicago and St. Louis are specially active in buying Iron. Old Wheels and Rails are in active demand. The advance of prices of Coke East has also been of benefit to the market, as consumers believe it is a legitimate advance made by the demand of furnaces for fuel, on account of their ability to obtain good prices for Iron. Every one is rejoiced over the situation and delighted that the present market did not descend as low as that experienced during the last great decline. It is not thought, however, that the market will advance much more, nor is it thought to the interest of furnaces to have too rapid changes in prices take place.

Southern Coke, No. 1 Foundry.....	\$16.75 @	\$17.75
" No. 2.....	15.75 @	16.75
" No. 2½.....	15.25 @	15.75
Hanging Rock Coke, No. 1 Foundry.....	17.25 @	17.75
Hanging Rock Charcoal, No. 1 Foundry.....	21.00 @	23.25
Southern Charcoal, No. 1 Foundry.....	18.00 @	18.50
Silver Gray, different grades.....	14.25 @	15.00
Southern Coke, No. 1 Mill, Neutral.....	13.50 @	14.50
" No. 2.....	13.00 @	14.00
" No. 1 "Cold Short.....	13.00 @	14.00
Charcoal, No. 1 Mill.....	14.25 @	14.50
White and Mottled, different grades.....	12.75 @	13.25
Southern Car-Wheel, standard brands.....	22.25 @	25.25

Hanging Rock, Cold Blast.....	23.25 @	25.25
Hanging Rock, Warm Blast.....	19.25 @	20.25

Detroit.

WILLIAM F. JARVIS & Co., under date of August 20, report as follows: Since our last report a number of inquiries for round lots of Lake Superior Charcoal Iron have been received and a number of orders have been booked. The furnaces that cannot deliver after the close of navigation are compelled to refuse orders at 50 cents over prices at which they sold a month ago. Their inability to furnish the Iron desired naturally causes the furnaces that can deliver the year round to hold at firmer prices, as they expect to sell to better advantage later on. Mahoning Valley furnaces claim that they are able to obtain 50¢ @ \$1 @ ton advance for Bessemer and Mill Irons, and a few of these furnaces have withdrawn from the market for the present, as they are unable to deliver Iron as fast as required on orders already booked. If they remain out of the market for any length of time, an advance

will certainly take place. There is a good market for Old Wheels, but sellers are asking more of an advance than buyers are willing to pay, so that there have been but few sales made. With a firm market we quote as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @	\$20.50
Lake Superior Coke, all ore.....	19.25 @	19.75
Lake Superior Coke, cinder mixed.....	18.00 @	18.50
Standard Ohio Black Band.....	19.25 @	19.75
Southern No. 2.....	17.75 @	18.25
Southern Gray Forge.....	15.75 @	16.25
Southern Silvery.....	17.00 @	17.50
Jackson County (Ohio) Silvery.....	18.50 @	19.00
Old Wheels.....	19.25 @	20.00

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, August 21, 1888.

While there is nothing developed as yet that can be properly characterized as a boom, there has been within the past week a general hardening of prices for all kinds of Iron and Steel, which may be attributed mainly to the recent advance in Pig Iron. That there will be a good demand for all kinds of manufactured goods this fall scarcely admits of a doubt, but in view of the immense capacity for making the same it is probable that prices will be close, the natural result of an active competition. One of the chief events of the week was a resumption of river navigation; over 1,000,000 bushels of Coal were shipped to Cincinnati, and a good deal more would have been started but for the fact that the water was scant, making it risky. And besides there was nothing in the business to justify shippers in taking extra risks. The Coal markets below are well supplied, and there is no particular anxiety to make additional shipments. It looks as if the local Coal market would be considerably improved before long.

Pig Iron.—There is an active market and prices have further advanced, sales of Mill Iron having been made at an improvement of from 15¢ to 25¢ @ ton, as compared with the prices of a week ago, and within the last four or five weeks of almost \$1. While some operators are confident that prices will go still higher, others equally well informed are not so strong in the faith. They point to the idle furnaces which are liable to be started upon short notice, thereby leading to an increased production, as sufficient to cause a feeling of apprehension, but those who are bullishly inclined make a strong point of light supply, as well as the large and probability of increased consumption. The demand for Foundry Irons continues light, but is expected to improve as the fall season becomes more advanced. Bessemer strong with considerable inquiry, but \$17.25, cash, still appears to be the ruling price, at which there was a sale of 2500 tons reported; rumors prevail of sales having been made at \$17.50, cash, but they are not well authenticated, unless for special analysis. We quote prices as follows:

Neutral Gray Forge.....	\$14.50 @	\$15.00, cash
All Ore Mill.....	15.50 @	16.00, "
White and Mottled.....	13.50 @	14.00, "
No. 1 Foundry.....	16.75 @	17.00, "
No. 2 Foundry.....	15.75 @	16.25, "
Charcoal Foundry.....	21.00 @	24.00, "
Cold Blast Charcoal.....	25.00 @	28.00, "
Bessemer Iron.....	17.25 @	17.50, "

Muck Bar.—There is more inquiry and prices have further advanced. We now quote at \$27 @ \$27.50, cash, although as yet there have been, so far as we can hear, but few sales made at the outside quotation. As compared with the lowest point, there has been an advance of \$1.25 to \$1.50 @ ton, and unless there is a reaction in Pig Iron a still further advance is not improbable.

Manufactured Iron.—There is an increasing demand for all kinds of finished Iron, and prices are firmer and higher; there has been an advance probably of \$1 @ ton. The upward tendency of prices

has stimulated demand. Bars may be quoted at \$1.80 @ \$1.85, 60 days, 2% off for cash, for first quality Iron. Skelp Iron is higher and is now quoted at \$1.70 @ \$1.75.

Nails.—The general position of the Nail trade remains unchanged. Here in Pittsburgh business is dull, which is owing to the fact that buyers can do better elsewhere, and very few orders are being placed here in consequence. We continue to quote at \$1.90 for 12d to 40d, 60 days, 2% off for cash, which is the regular card price, but buyers, as already intimated, have, until quite recently, been able to do better elsewhere. Probably now that Nail Plate has stiffened there will be but few sellers found below card rates, which are low enough in the present condition of affairs. It is possible that those who have been cutting the life out of the market will now want to advance the card, but those who have been refusing to cut below card rates will doubtless refuse, as it would only give the former another chance to cut. The Pittsburgh manufacturers are determined not to sell at or below actual cost of production.

Wrought-Iron Pipe.—There is an increasing business, but it is still considerably short of what it was a year ago. While some of the mills are pretty well employed others are not, and, while business bids fair to further improve, no special activity can reasonably be expected during the remainder of the year. Prices are firmer, owing to increased cost of Pipe Iron, which has gone up fully \$1 per ton. As repeatedly stated in these reports, the market has been in an unsettled condition in regard to prices since last winter, each firm making its own prices, hence it is difficult to give accurate quotations. Discounts on Black Butt Welded may be given at 55%; on Black Lap Welded, 65%; on Galvanized Butt Welded, 47½%; on Galvanized Lap Welded, 52½%; Boiler Tubes, 65% off. The above appear to be the leading rates in this market.

Old Rails.—There is considerable inquiry for Old Iron Rails, with but few to be had, and prices are still tending upward. Sales have been made during the week under review at \$22, and some of the brokers say they could obtain an advance of 50¢ to \$1 per ton if they could get them for immediate delivery. The advance in the price of domestic Rails will open the way for foreign in this market, but it is probable that they too will advance. Old Steel Rails are also in demand and tending upward; may be quoted at \$20.50 @ \$21.50.

Billets, &c.—There is a continued good demand for Bessemer Billets and prices are tending upward; we now quote at \$28.50 @ \$29, cash; Nail Slabs may be quoted at \$28.50; sale 1000 tons Bloom Ends at \$18.50, cash; Steel Rails are still quoted at \$31 @ \$31.50, cash, at mill.

Railway Track Supplies.—Railway Spikes remain unchanged at \$2, 30 days, delivered; Splice Bars, \$1.80 @ \$1.85; Track Bolts, \$2.85 with Square and \$2.95 with Hexagon Nuts.

Old Material.—There is an increase in demand for all kinds of Old Material and prices are firmer. No. 1 Wrought Scrap, \$19, net ton; Car Axles quoted at \$22 @ \$23, net; Wrought Turnings, \$13 @ \$13.50; Cast Borings, \$12, gross ton; Cast Scrap, \$15; Old Car Wheels, \$19 @ \$20, Mixed Steel Scrap, \$16.25, gross; Short Piece Steel Rails, \$17 @ \$17.25.

The co-partnership heretofore existing between Frank S. Moorhead and John Moorhead, Jr., under the style of Moorhead, Brother & Co., proprietors of the Vesuvius Iron and Nails Works, of Pitts-

burgh, has been dissolved by the retirement of Frank L. Moorhead. The business will be conducted by the remaining partner in the name and style of Moorhead, Brother & Co.

New York.

Office of *The Iron Age*, 66 and 68 Duane street, New York, August 22, 1888.

American Pig.—The majority of dealers and furnace agents report that there is a better feeling, while some assert that consumption is still below last year's average. Founders are reported to be prompt in covering their requirements as soon as they have closed contracts, and it is pointed out that this departure from the practice of taking their chances till the last moment is in itself an important gain. There is less pressure to sell, notably on the part of furnaces in Virginia, Alabama and Tennessee, but we hear of Tennessee No. 1 Foundry still selling at \$17.50. Standard brands of No. 1 Northern Iron are selling at \$18, and \$18.50 is being secured for small lots, and \$19 for choice Irons. In No. 2 we hear of offers of good brands, though not all-ore Iron, at \$16 @ \$16.50. In Gray Forge the recent activity, during which a number of heavy blocks were placed, has subsided.

Scotch Pig.—Some importers report a run of small orders for Scotch as softeners, while others find the trade very dull. The advance on the other side will only have the effect here of curtailing what little business there is, since Scotch Pig at present prices is relatively too dear to be extensively used. Efforts to boom warrants on the other side, through the aid of American operations, are not finding much favor. The market there is said to be on the eve of an advance if it can be shown or can be made to appear as though there were buying on American account. We quote: Coltness, \$19.75 @ \$20; Dalmellington, 18.75 @ \$19.25, and Langloan, \$19.50.

Bessemer Pig.—Sales of several thousand tons of foreign Bessemer are reported, a part being best West Coast brands and a part special Pig.

Spiegeleisen and Ferro.—Spiegeleisen remained dull at \$26 for German and \$27 for English 20% nominally. Foreign Ferro is held higher, \$50 @ \$50.50 for 80%, the price having advanced abroad on account of a scarcity of Ore.

Bar Iron.—We continue to quote for carload lots, half extras, on dock, 1.57½¢ @ 1.65¢ for Common; 1.65¢ @ 1.7¢ for Medium, and 1.75¢ @ 1.9¢ for Refined.

Structural Iron.—We quote for round lots, on dock: Sheared Plates, 2¢ @ 2.10¢; Universal Mill Plates, 2.10¢ @ 2.15¢; Angles, 2.5¢ @ 2.15¢; Tees, 2.5¢ @ 2.7¢ and Channels and Beams, 3.3¢.

Plates.—We quote for round lots, on dock: Iron Tank, 1.9¢ @ 2¢; Shell, 2.15¢ @ 2.30¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.7¢ @ 3¢, and Fire-Box, 3.7¢ @ 4¢. Galvanized Sheets are 65% @ 65 and 5%.

Steel Rails.—Sales by Eastern mills aggregate about 15,000 tons, of which one block of 5000 tons was for a Southern road, with option to double the quantity, and two others were for Coal roads, closed during the past ten days and not yet reported. The competition is extremely sharp, and the outlook is gloomy. Very few of the Eastern mills have their September capacity fully engaged, and a smaller number still have anything but straggling orders for later delivery. At this time of the year the fall requirements ought to cause a lively market, and yet the business coming up is comparatively small. The majority of contracts are made at a delivered price, and as they are

largely dependent upon special freight arrangements, the mill prices obtained are not generally known. We quote: \$28.50 @ \$29 at mill for standard sections, there being rumors of sales as low as \$29 at tidewater. In the West the condition of affairs is as bad if not worse. It is reported that 3000 tons of Rails for the Northern Pacific was sold at \$31.25 Duluth, other bids being \$31.60, \$31.65 and \$32.

Wire Rods.—There have been a number of sales at low prices for Western delivery prior to the close of navigation, low canal freights having been obtained. The German makers, disappointed in the relatively small business doing on their side, have lowered their prices to 102/ @ 103/ at shipping port, and the fact that American mills in the West have been crowded with orders has given an opportunity to again invade the Western market. We quote at tidewater \$39.50 @ \$39.75.

Old Rails.—The market has been active again, the following sales being reported: 2000 tons American Tees at \$22, delivered, Mahoning Valley; 1000 tons Tees at \$21, on barge, New York; 1500 tons foreign Tees at \$21, delivered to lighter, and 200 tons of Tees at \$21.25, delivered to lighter. We note also a sale of 3000 tons of Tees at \$18 at New Orleans, for shipment to a Western mill. The demand continues active, several inquiries of some magnitude being in the market, with \$21 bid. The supply here is light, and the Double Heads particularly are held above the market. Present prices are too low to admit of importations, but cable inquiries have already gone abroad, and the conviction is expressed by some that the winter will not pass without importations.

Scrap.—The market is dull at \$18 @ \$19 for No. 1 Wrought.

Fastenings.—The market for Spikes has been more active, and a number of large blocks have been sold; \$2.10 is now the lowest price, and there is a movement in progress among the mills to advance the price to \$2.25 at an early date. The idleness of the mill of Dilworth, Porter & Co., of Pittsburgh, and of the Ames works at Jersey City is an important feature in the situation. Angle Bars are firmer, but unchanged at 1.90¢, delivered.

Cotton Ties.—We quote \$1.05 @ \$1.12½ per bundle at Gulf ports, according to time of delivery.

Financial.

All accounts concur in representing that general trade is improving not only in volume and activity from week to week, but when compared with the corresponding date last year. As the season advances the assurance of good crops becomes more positive, accompanied by increasing evidence that the European demand will be heavy. The *London Economist* says, from reports of its special correspondents, that estimates on the French crop have been reduced to 80,000,000 hl., or 227,000,000 bushels. In Germany crop prospects were depressing. In Austria-Hungary the crop had been gathered in fair condition and was large, but after being gathered heavy rains set in and caused serious damage.

A reference to the speculative markets in this city shows unusual excitement in cotton and breadstuffs, and high prices for oil. The dry goods jobbing trade was unfavorably influenced by the extreme heat, and although better than the previous week did not realize expectations. The most interesting feature was the large business done in wool. At Boston and Philadelphia the transactions are given at nearly 11,000,000 lb., and all markets were higher, indicating that manufacturers are well supplied with orders. The

anthracite coal trade is phenomenally large. In New England special activity is noticed in shoe and leather establishments.

In the New York markets on Monday there was a collapse in August cotton, the "corner" being unable to bear up longer under the pressure. Market opened at 11.18 and closed at 10.74, a drop of 44 points. Inman, Swan & Co., the holders of the cotton, are said to have made \$3,000,000. It is also said that they still control 135,000 bales of cotton, of which 35,000 bales are loading for export. Another sensation was a sudden jump in wheat, spot stock, 2¢ @ 2½¢ per bushel, with good export trading, and millers bought more freely. Flour was also very active. At the same time there was another marked advance in grain freights to the United Kingdom. Petroleum was steady at ½¢ advance. Altogether the Produce Exchange presented a scene of unusual animation.

The Stock Exchange markets were irregular, and for the most part dull and weak. On Thursday and Friday the reaction was equal to 1½ @ 2 ¢, affecting almost the entire list. On Monday prices were firmer. The Pennsylvania road and the Vanderbilt lines advanced rates on dressed beef from Chicago to the seaboard, but the rates via Duluth and those via Chicago have not yet been equalized, and the movement looking to the restoration of rates in the Northwest made very little, if any, progress during the week. The coaling properties suffered least.

Government bonds very strong, with 4s ½ ¢ and 4½s ½ ¢ higher. Quotations are as follows:

U. S. 4½s, 1891, registered	106¾
U. S. 4½s, 1891, coupon	107¾
U. S. 4s, 1907, registered	128¼
U. S. 4s, 1907, coupon	128¾
U. S. currency 6s	120

The weekly bank statement showed a further loss of \$2,370,575 in the surplus of reserve above the 25 % legal requirements. The excess of reserve is thus reduced to \$21,736,250. The loans show a gain of \$2,118,600; the specie is decreased \$1,115,900; the legal tenders are down \$1,386,600. There is reason to believe that the actual condition of the Associated Banks is much better than that shown by the averages. In any event, the amount of the surplus reserve is considered ample for all requirements, being five times as large as it was a year ago, and over three times as large as in the preceding year. In addition, the large export movement of produce, and the lower rates for foreign exchange, together with the more liberal policy of the Secretary of the Treasury, tend to dismiss any lingering fears of monetary stringency. Money on call is 1½ ¢ @ 2 ¢. Time loans on good collateral are quoted: Sixty days, 2 @ 2½ ¢; three months, 3 ¢; four months, 3½ ¢, and six months, 4 ¢ @ 5 ¢. Commercial paper is fairly active. The best single-name paper sells at 4½ ¢ @ 5 ¢, and good double-name paper is readily placed at 4 ¢. Sterling exchange is firmer for demand bills.

The purchases of United States bonds under the circular of April 17 are as follows: Amount purchased, 4 per cents, \$22,762,600; 4½ per cents, \$10,535,300; total, \$33,297,900. Cost of 4 per cents, \$28,941,727.82; 4½ per cents, \$11,841,355.07; total, \$40,283,282.89. Secretary Fairchild has directed that all the bonds purchased by the Government since July 1 shall be applied to the purposes of the sinking fund. The estimated requirements of that fund for the present fiscal year are \$47,850,000, and the Secretary proposes to meet them, if possible, by the purchase of bonds made under the terms of the circular of April 17.

The total clearings of 38 cities for the week ending August 18 were \$871,161,388, an increase of 7.8 %, as compared with the corresponding period last year.

New York increased 7.5 ¢, Boston, 12.1 ¢, Philadelphia, 19.9 ¢, Pittsburgh, 25.1 ¢, Omaha, 31.9 ¢ and Duluth, 85.2 ¢. New Haven decreased 20.9 ¢, Galveston, 17.9 ¢, St. Joseph, 17.1 ¢, Columbus, 13.1 ¢, San Francisco, 10.4 ¢ and Cincinnati, 4.7 ¢.

Respecting crop prospects in the United States the latest Government report says the weather during the week has been favorable for growing crops in the wheat and corn regions of the Northwest, where reports indicate that the crop prospects have been improved. The St. Paul *Pioneer Press* estimates the wheat crop of Minnesota and Dakota at 100,000,000 bushels. Ultra conservative judges make the figure 10,000,000 to 15,000,000 bushels less. The Northern Pacific Railroad Company, in this city, have advices that harvesting has commenced on the Black Hills and Little Falls branches, in Dakota. The indications are that crops will be double those of last year and of the best quality. On the West Minnesota division the crop will not be gathered for a week or ten days yet in the country tributary to the Dakota line. It is predicted the crops will be the largest and best in this region for a number of years. The harvest is also in progress along the line of the St. Paul division. The cotton crop is reported to be in good condition, though some small sections in Texas are suffering from drouth.

According to the Custom House report the exports of specie from this port during the week amounted to \$240,000 and the imports were \$75,000. Since January 1 the total exports are \$26,250,000; imports, \$5,758,000.

The imports of merchandise at this port were larger, the total valuation being \$9,260,000, of which \$3,000,000 represents dry goods. Since January 1 the total is \$301,089,000, as compared with \$302,619,900 for the same time last year and \$275,925,000 in 1886.

The attorneys for the State of Iowa say in regard to the suits brought against the railroads for extortion in charges for freight: "If test cases were brought and the railroads got them into the federal courts, they could delay final adjudication for years, and in the meantime the Iowa jobbers would be ruined. Our plan is to begin a large number of cases, so that the penalties, in case the railways are defeated, would be an incentive for them to have the matter settled as soon as possible."

Metal Market.

Copper.—The market on both sides of the Atlantic has been featureless during the week, with very little disposition to trade. London improved with spot Chili Bars from £81. 10/ to £82. 10/ this morning, while futures gave way from £78. 5/ to £78; good merchantable brands advanced from £73. 5/ to £73. 10/, and Best Selected from £76 to £76. 10/, sales summing up 500 tons, while the sales here were confined to small spot lots at 16.65¢ @ 16.75¢, and 400,000 lb August at 16.65¢; for later months 16½¢ is bid. One of the oldest gentlemen in the Copper trade remarked this morning that M. Secretan only maintains such a high price for Copper in order to get from the French bankers as much money on his holdings as possible, and that the smash-up, when it does come, will be all the more fearful and disastrous. The import of Ingot Copper into France during the first six months has been 22,258 tons, against 11,013 tons last year and 9636 in 1886. Rio Tinto shares improved on the Paris Stock Exchange 21 francs last week.

Tin.—Tin touched £94. 10/ with futures last Thursday in the London market, but after some fluctuations they are now £93, while spot Tin has from £92. 15/ given

way to £92. 10/ in the meantime, sales aggregating over there 300 tons. Here but little transpired, the demand being the reverse of active; and after some wavering closes nominally as follows: Spot, 20.75¢ @ 21.10¢; August, 21.10¢ @ 21.15¢; September, 20.75¢ @ 20.90¢, and October, 20.65¢ @ 20.85¢. As per cable from Gillfillan, Wood & Co., Liverpool, to Mr. Charles Nordhaus, E. I. agent, No. 89 Water street, New York, the Straits Settlements shipped to the United States, August 1 to August 15, 150 tons of Tin against 450 same time last year, and 500 to England against 1000. Since Jan. 1 the shipments this way were 1300 and 3250 respectively, and to England they were 11,100 against 8000. **Tin Plates.**—Cokes are still scarce, and wanted and held with great firmness, other sorts have been barely sustained, and futures unsettled by the uncertain aspect of the Pig Tin market. We quote toward the close, large lines, ½ box, on the spot: Siemens-Martin Steel, charcoal finish, \$4.85 @ \$5.25; Coke finish, \$4.75; Ternes, \$4.30 @ \$4.40; Bessemer Cokes, \$4.50 @ \$4.60, and Wasters \$4.20 @ \$4.25; Liverpool is 13/6 with Coke Tin.

Lead.—The chief operator has been untiring in trying to pick up some more Lead on the spot, and October and November delivery, and in this manner some 1800 tons were sold in the open market at 4.40¢ down to 4.30¢, the quotation toward the close being 4.30¢ @ 4.35¢; 16 tons October brought 4.32½¢; 96 tons do., 4.30¢ @ 4.32½¢, and some September, 4.37½¢, on the Metal Exchange since our last report. Chicago and St. Louis are 4.30¢, strong. In London Soft Spanish remained steady at £13, while English Pig rose from £13 to £13. 5/.

Spelter.—Has attracted a great deal of attention both on 'Change and in the open market, and has been active, with a gradual rise to 5¢ on the spot for Common Domestic; 32,500 lb October Spelter brought on 'Change 4.85¢ this forenoon. The best Blende Ore out West has risen from \$22 ½ ton to \$26, and, it is anticipated, will command \$30 ere long from actual scarcity, while the demand is good. In Europe the markets have also been rising steadily, and Silesian has improved from £17 to £17. 5/. They cable thence that there is a great and growing consumptive demand over there. Silesian cannot now be laid down here for less than 5.45¢, and the quotation at the close is 5.45¢ @ 5.50¢ for it.

Antimony.—Has been moderately active 9¾¢, Hallett, and 13¾¢, Cookson. The former dropped from £39 to £38.

New York Metal Exchange.

The following sales are reported:

THURSDAY, August 16.	
25,000 lb Copper, spot	16.70¢
FRIDAY, August 17.	
175,000 lb Copper, August	16.65¢
32 tons Lead, September	4.37½¢
10 tons Tin, September	20.80¢
10 tons Tin, September	20.85¢
200,000 lb Copper, August	16.65¢
18 tons Lead, September	4.37½¢
32 tons Spelter, October	4.70¢
18 tons Spelter, October	4.72½¢
MONDAY, August 20.	
18 tons Lead, October	4.32½¢
80 tons Lead, October	4.30¢
TUESDAY, August 21.	
20 tons Tin, October	20.85¢
16 tons Lead, October	4.32½¢

Coal Market.

The Anthracite Coal market is active almost beyond precedent for this season of the year, the output from the mines being enormous, and increasing from week to week, so that the "banner month," August, 1884, is likely to be surpassed. For the week ended August 18 the total from

20 are sorted by hand, employing 36 sorters, 18 on each turn. A new shipping warehouse has lately been completed. It is located on the Bridge and Tunnel Railroad, over which all trains pass in and out of St. Louis. Its size is 100 x 172 feet, one story high, the sides being constructed of corrugated iron, and the whole building covered with a gravel roof with numerous skylights. Six cars can be loaded here at one time, and as many as 30 cars have been loaded in a day. There are 425 hands on the pay roll in all departments. Special care is given to the comfort of the employees, an instance of this being the recent erection of a bath tank for their use, in the basement of one of the main factories. It is 16 feet long, 8 feet wide and 4 feet deep, lined throughout with zinc, and running water of even temperature will be supplied to it the year round. Ample dressing rooms have also been provided. The officers of the company are as follows: William Edenborn, president; J. W. Gates, vice-president; A. Clifford, treasurer; C. H. Rowe, secretary.

The stockholders of the St. Louis Wire Mill Company are also interested in the Braddock Wire Company, whose works are at Rankin, Allegheny County, Pa. They manufacture wire rods, plain wire and barb wire. At present 36 barb-wire machines are in use in this plant, but 14 more will be added in September. The total annual capacity of the barb-wire departments of these two companies is 30,000 tons, or about one-sixth of the capacity of the entire country. Improvements have just been completed in the rod mill at Rankin, which add greatly to its efficiency and dispense with a number of workmen formerly considered necessary. This is accomplished by an arrangement of iron troughs or guides, which extend on both sides of the rolls. When the billet is inserted the resulting rod enters a trough, which curves round to the next pass, then enters a trough curving in a similar manner to another pass, and so on until it is rolled to the required gauge, when it is for the first time caught by a workman who attaches it to the reel. The troughs, of course, increase in length as each pass reduces the size of the rod. New heating furnaces have also been put in, and the officers of the company claim that they now have the best rod mill in America. It is true that they use four engines at Rankin, while only one is used in the new rod mill at Joliet, but an advantage is claimed for the former in that respect, as with one engine the relative speeds of the trains are fixed, and, as the rolls in some places wear more than in others, it is desirable to be enabled to speed up or reduce the speed of the various trains independently, which is accomplished best by separate engines. The Joliet engine is a compound condensing engine, which is very economical in fuel, and this feature is a strong recommendation for its use wherever fuel is not very cheap. At Rankin this is not a matter of so much importance. Both mills take a 4-inch billet, and make 18 passes to a No. 5 rod, and consequently about the same power is required in each case, whether furnished by one or by four engines. The sales department of both the Braddock Wire Company and the St. Louis Wire Mill Company is at 821 South Twenty-first street, St. Louis. The officers of the Braddock Wire Company are as follows: William Edenborn, president; J. W. Gates, vice-president; Thos. W. Fitch, superintendent; Wallace H. Rowe, secretary and treasurer.

President Salomon, of Hayti, is a fugitive under British protection, and the so-called "black republic" is again in control of revolutionists. United States vessels are ordered to Haytian waters.

Hardware.

Business has fallen off during the past week, and the market is considerably duller than at our last writing. Nor is this dullness confined to Hardware, but is characteristic of most other lines of business in this city. Ammunition is about the only line in which there is any great amount of business, this being the time of year which is usually most active in this line.

Wire Nails.

Complaints continue to be made of considerable irregularity, prices for small lots varying between \$2.45 and \$2.60, from store. A meeting of Wire Nail manufacturers is being held at Cleveland.

Cut Nails.

The New York market continues fairly active, with carload lots on dock selling at \$1.85 to \$1.90, and small lots from store at \$1.90 to \$2.

There is a movement on foot among some of the manufacturers of Augers and Bits to form a combination for the purpose of advancing prices. No great progress has yet been made in this direction, but the agitation of the subject has resulted in a firmer feeling among manufacturers.

The Fork and Hoe makers held their annual meeting at Rochester, N. Y., commencing on the 14th inst. and continuing in session three days. The business of the union for the past year was closed up and the association continued for another year upon substantially the same basis as heretofore, the old officers being re-elected. Prices remain unchanged.

Owing to the late advance in Pig Lead the prices of Shot have been advanced 5 cents, making Eastern prices:

Drop, per bag, 25 pounds.....	\$1.30
Drop, per bag, 5 pounds.....	.31
Buck and Chilled, per 25-pound bag.....	1.55
Buck and Chilled, per 5-pound bag.....	.36

Sisal Rope has advanced $\frac{1}{4}$ cent a pound. There is no change in Manila. The market is very firm, with small stocks of Herup. We quote at manufacturers' prices, subject to $1\frac{1}{4}$ per cent. for cash in ten days.

Manila, $\frac{1}{4}$ inch and larger.....	11 $\frac{1}{4}$ cents per lb
Manila, $\frac{3}{8}$ inch.....	12 " "
Manila, $\frac{1}{2}$ and 5-16 inch.....	12 $\frac{1}{2}$ " "
Manila Tarred Rope.....	11 " "
Manila Hay Rope.....	11 $\frac{1}{4}$ " "
Sisal, $\frac{1}{4}$ inch and larger.....	9 $\frac{3}{4}$ " "
Sisal, $\frac{3}{8}$ inch.....	10 $\frac{1}{4}$ " "
Sisal, $\frac{1}{2}$ and 5-16 inch.....	10 $\frac{3}{4}$ " "
Sisal Hay Rope.....	9 $\frac{3}{4}$ " "
Sisal Tarred Rope.....	9 $\frac{1}{4}$ " "
Sisal Medium Lath Yarn.....	8 $\frac{3}{4}$ " "

The Stanley Rule and Level Company claim that whatever the weakness of political platforms, or the fate of candidates who step on to them, the carpenters and painters of the country have a sure thing in the new Roofing Bracket illustrated in the company's advertisement to-day. A single glance at the construction of the Bracket will show that it has come to stay. Discount to the trade 20 and 10 off.

The Moore Mfg. Company, of Chicago, were succeeded on the 25th ult. by the Moore Mfg. and Foundry Company, of Milwaukee. The main office of the company is continued at 51 and 53 Franklin street, Chicago. They are erecting at Milwaukee an extensive plant for the manufacture of their line of Hardware specialties, including Door Hangers, Novelty Tackle Blocks, Vises, Differential Pulley Blocks, &c., and will also be prepared to take contracts for light and medium weight Gray Iron Castings, light machine work, forging and japanning. The new works will be put in operation about the 15th of October. An illustrated catalogue

is now in preparation, and will soon be ready for distribution.

The Nut and Bolt Works of the Lake Erie Iron Company, Cleveland, Ohio, which have been closed since July 1, owing to a disagreement with the men, have started again, the men yielding in their contest with their employers, which was merely as to frequency of payment. Their capacity is 40 tons a day of Bolts and Nuts, and with this production they feel sure of being able to make prompt shipment of orders.

The firm of Woodruff, Miller & Co., Mount Carmel, Conn., have been dissolved and a new partnership formed under the style of Walter W. Woodruff & Sons, composed of Walter W. Woodruff, Arthur E. Woodruff and Harry P. Woodruff.

By an error of the compositor in the Alford & Berkele Company's advertisement last week we made the discount on IXL Shells 40 and 50 per cent., instead of 40 and 5 per cent., which are the correct figures. We trust none of our readers were misled thereby.

The Western Toy Company, 495 to 503 Wells street, Chicago, manufacturers of Bicycles, Sleds, School-desks and furniture, suffered a severe loss by fire on the 15th inst. A number of tools, valuable machinery, and a large stock of partly completed goods were destroyed, entailing a loss of about \$5000, fully covered by insurance. Adjoining buildings, containing more costly machinery and a very heavy stock of goods, were saved.

T. T. Roberts, secretary and treasurer of the Decatur Coffin Company, of Decatur, Ill., states that their Eureka Spiral Screw Driver is meeting with increasing popularity both here and abroad. Export orders are now being regularly filled from almost all the principal countries of the world. A recent inquiry came from China, showing that even the inhabitants of the Flowery Land were aware of its good qualities, and proposed to introduce its use among their mechanics.

John Ray, a File manufacturer, of Newark, and who for some 20 years has had a good commercial rating in that city, died by his own hand on the 18th inst. The night before his death he brought home his bank books, and in other respects deliberately arranged the closing of his affairs. As he was not known to be a drinking man his troubles are attributed to a very recent divorce and subsequent marriage. He was 49 years of age.

Low & Woodruff, handling various lines of Hardware specialties at 121 Lake street, Chicago, have been appointed Northwestern agents for the Braddock Wire Company, manufacturers of Wire Rods, Wire, and Barb Wire.

By a reference to the advertisement of John H. Graham & Co., 118 Chambers street, New York, it will be seen that they have added the Birmingham Plane Mfg. Company's Iron Planes, &c., to their important list of agencies.

Organization of Heavy Hardware Jobbers.

An important meeting of the jobbers of Heavy Hardware was held at the Grand Pacific Hotel, Chicago, on the 14th and 15th insts. It was called by the Chicago jobbers, who had issued a circular a week before to the leading jobbers of Heavy Hardware throughout the country, inviting them to be present. Notwithstanding the extremely short notice given, representatives of the trade attended from Buffalo, Fort Wayne, Milwaukee, St. Paul, Davenport, St. Louis and Chicago. Establishments in Detroit, Toledo, Cleveland, Louisville, Peoria and Dubuque were heard from by letter. The object of the

meeting was to devise measures to protect the jobbing trade from the injuries claimed to be inflicted upon them by the various combinations of manufacturers now existing and others in process of formation. The holding of the conference was hastened by the combination now understood to be organizing which will embrace all the manufacturers in the country engaged in producing any class of material entering into the construction of wagons and carriages. The unanimous opinion of the jobbers present at the meeting, and those who sent letters, was in favor of united action for the protection of their business. The proceedings of the meeting were confined to the arrangement of necessary preliminaries. An organization was effected by the election of J. J. Parkhurst, of Parkhurst & Wilkinson, Chicago, as president, and of Charles R. Blake, president of the Sligo Iron Stove Company, St. Louis, as secretary. Resolutions were passed condemning the action of certain combinations of manufacturers, and the secretary was directed to send printed reports of the proceedings to the Heavy Hardware jobbers of the country and invite their co-operation in the movement. As soon as 50 to 75 houses shall have sent in their approval of the objects of the organization another meeting will be called to outline a course of procedure.

While some of the active promoters of the organization are outspoken in their denunciation of combinations, and regard them as unwholesome appendages of the manufacturing business, others are inclined to accept conditions as they find them, so that sweeping action against all combinations on the part of the jobbers' association is hardly to be expected. Their grievances consist, first, in the adoption of uniform price lists by the manufacturers entering into a combination, which price lists are made public, and which put jobbers on an equal footing with consumers able to buy in the same quantity; and, second, in the invasion of the smaller trade by the manufacturers who, in that way, compete directly with the jobbers, their best customers. It is claimed that these questions affect not only the West, in which the manufacturing interests are comparatively undeveloped, but the East, also, in which jobbing houses are still an important factor in the distribution of goods, notwithstanding the proximity of manufacturers. The organization of jobbers will therefore seek to be national in its scope, and will wield a correspondingly powerful influence in effecting the desired reform in manufacturers' prices. Its originators claim that manufacturers gladly make use of the opportunities jobbers offer for the distribution of goods at low cost; that manufacturers recognize jobbers as their best customers for many classes of goods, and that manufacturers are entirely willing to permit jobbers to handle the small trade whose orders are light and whose credit is often a matter of personal honor rather than a favorable rating in a commercial agency's report. The jobbers therefore insist that they are entitled to fair treatment in the matter of discounts, so that they can transact their business with a reasonable profit. Failing to get this, they might as well restrict their operations, discharge their travelers and conduct a purely retail trade.

In this connection the experience of the jobbers of Shelf Hardware is of interest. Some ten years since it was found by the Western jobbers particularly that their business was being seriously interfered with by the broadcast distribution of manufacturers' price lists, naming terms on which goods could be bought by any dealer, whether a jobber or a retailer. At the instance of Chicago jobbers a meeting of the Shelf Hardware jobbers of the West

was held, and the Western Hardware Association was formed for the purpose of protecting their interests. This association embraced such a large number of merchants that their complaints were treated with respect by the manufacturers, and the price lists they objected to were corrected with due regard to the jobbing trade. The fact was recognized that the jobbers filled a very important function in the cheap distribution of goods over an immense territory, which the manufacturers were not prepared to supplant or replace. For a long time the association held regular meetings, rotating from Chicago to St. Louis and Cincinnati. Other matters were taken up and settled to the great benefit of the trade. An arrangement was effected, which still continues, whereby the salesmen of any house were not to be enticed to another house. Prices, however, were not regulated by the association, it having been agreed that every member should be perfectly free to sell as he pleased. In two or three years other effects of the association began to be noted which had not been anticipated. The large jobbers found that the smaller houses in the association were getting the same discounts as themselves and were thus being enabled to gradually build up a trade which threatened in time to become formidable. Manufacturers recognized all members of the Western Hardware Association on an even footing, and carefully treated them all alike. This was not in accordance with the views of the larger jobbers, who did not propose to lose the prominence they had acquired by dint of large capital or long experience. They abandoned the association forthwith and declared that from that time every tub should stand on its own bottom. The prime object of the association had been accomplished, however, and in that respect it was regarded by the jobbers as an entire success.

Trade-Marks.

The following summary of the decision of an important trade-mark case will interest many of our readers:

Brooks & Le Page made and sold a liquid glue under the name of "Le Page's Liquid Glue," and they subsequently formed a corporation—the Russia Cement Company—which they sold out to the other parties, who continued the designation of "Le Page's Liquid Glue" as a trade-mark, under the terms of the sale, which provided for "the right to use the trade-marks belonging to or in use" by the vendor. Le Page afterward advertised that he would make and sell a glue, calling it "Le Page's Liquid Glue," and the Russia Cement Company filed a bill in equity for an injunction to restrain him from using this designation, which it claimed as a trade-mark. The trial court refused to grant the relief on the ground that it prevented the defendant from using his own name in business, and the case—*Russia Cement Company vs Le Page*—was carried to the Supreme Judicial Court of Massachusetts, where the company were awarded a judgment. Judge Devens, in the opinion, said: "Every one has the right to use his own name honestly in his own business for the purpose of advertising it, though he may incidentally injure the business of another, who may suffer a loss for which, however, there is no legal remedy, because, in law, there is no recoverable loss. While this is the general rule, it is also true that one may so sell or part with the right to use his own name as a description or designation of a manufactured article as to deprive himself of the right to use it as such, and confer this right on another. A name used as an adjective of description is not necessarily understood by the public as any assertion that the person whose name is used is the maker of the article. One who has carried on a business under a trade name, and sold a particular article in such a manner by the use of his name as a trade-mark or a trade name as to cause the business or the article to become known or established in favor under such a name, may sell or assign such trade name or trade-mark when he sells the business or manufacture, and by such sale exclude himself from the further use of it in a similar way. A person may be enjoined, therefore, from using his own name as a description of an article of his own manufacture, and from selling the article under that particular name when he has parted with the

right thus to apply it. It is not upon the ground of invasion of the trade name adopted by another, but by reason of the contract he has made, that he is deprived of the right himself to use his name as all others of the same name may use theirs. By the sale to the company of the right to use the trade-mark of the business they had bought from Le Page and his associate, the exclusive right to use the term 'Le Page's Liquid Glue' for such an article passed to it, and the injunction must be granted."

Competition in Ciphers.

Every retailer requires a system for marking goods. Wholesalers also sometimes need something of the kind, although price lists and discounts for the most part meet their requirements. Where retail prices are marked in plain figures, as is becoming very popular nowadays, there is needed some other system for recording cost price. Ciphers are in very common use for this purpose, as well also for marking selling prices, where plain figures are not employed. The number of ciphers in use must be very large. After reflecting upon this fact, and making out a short list by way of experiment, we have decided to interest our readers in gathering together those that are in use, as well also as inventing new ones. In carrying out this idea we propose some cash prizes to those who shall send in, before October 1, 1888, the largest lists of ciphers for marking goods, all subject to the terms and conditions named below.

At the outset, and in order to make our meaning perfectly clear, we may refer to one or two ciphers in common use. One that is perhaps in as general employment as any is "Blacksmith." Another is "Complaints." These words illustrate the requirements. The word used for the cipher must have 10 letters, and no letter must be used more than once. Each letter assumes the numerical value of its order in the word. For instance, in the first case, B is 1, L is 2, A is 3, and so on. Sometimes phrases are used, but they are not considered as good as a single word for the purpose. The phrase "I should try" might be employed in this way. Phrases, however, admit of slight variations so easily that they are not considered as reliable as words, and for this reason they are excluded in this contest, as will be seen by the conditions below:

GENERAL CONDITIONS.

1. The lists are restricted to ten-letter words to be found in Webster's Dictionary.
2. Phrases and proper names are excluded.
3. The lists are to be written in columnar form, and on one side of the paper only.
4. The contestants name and address must appear on each sheet of paper used.
5. Vulgarisms and words for any reason deemed unsuitable for publication will be excluded.
6. The competition will close at 5 p. m., October 1, 1888, and lists received after that time will be rejected.
7. All the lists submitted, whether awarded prizes or not, will be subject to publication, at the discretion of the Editor. Contestants names will be published or not published in connection with their lists, according to their expressed preferences.
8. This contest is open to all, there being no restrictions whatever.

PRIZES.

Two cash prizes of \$15 and \$10, respectively, are offered. To the competitor sending the largest list, in accordance with the conditions above set forth, there will be paid \$15, and to the competitor sending the next largest list there will be paid \$10. In case of a tie in the largest lists, the whole sum, \$25, will be equally divided among the authors of the same.

DECISION.

All the lists submitted will be referred to a competent committee for examination and the award of prizes will be based upon their report. The results of the contest will be published as soon after the decision is made as practicable.

The lists are to be sent by mail, in sealed envelopes, addressed "David Williams, 66 and 68 Duane street, New York," and marked in lower left-hand corner of envelope "Cipher Competition." Matter other than that relating to this contest must not be inclosed in these envelopes, as they may not be opened until in the judge's hands.

To help those who desire to make their lists as large as possible, we submit the following from the *Minneapolis Tribune*, with the suggestion that the answer to the riddle is a word which perhaps would not be otherwise thought of:

"What are all those letters for on all your goods?" asked a customer of a leading druggist.

"They indicate the cost price of the articles," was the reply.

"The cost price, eh?"

"Yes; you take a word of ten letters, no two of which are the same, and you let those represent the digits, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, and there you are."

"I see; and what cipher word did you take?" The druggist winked and smiled. "I took a word which represents what I aim to make my business. That is all I will tell you. Look around for yourself and find out what you can."

The customer did as he was bid and had soon collected the following list of prices:

	Each	Per doz.
Nail brushes.....	e	rpl
Tooth brushes.....	a	bo
Bird-seed, packages.....	f	fa
Soap, cakes.....	i	il
Cologne, bottles.....	o	fpp
Manicure cases.....	rie	rbll

From these he found the cipher word. What was it?

Annual Meeting of the Vapor Stove Association.

The annual meeting of the Vapor Stove Manufacturers' Association of the United States was held at the Russell House, Detroit, on the 7th, 8th, 9th and 10th insts. The following members were present: Geo. M. Clark and H. M. Hubbard, of Geo. M. Clark & Co., Chicago; Garson Myers, of the Adams & Westlake Company, Chicago; George Kahle and C. A. Stockstrom, of the Quick Meal Stove Company, St. Louis; E. S. Barbour, E. L. Chamberlain and A. S. Phelps, of the Detroit Stove Works, Detroit; J. B. Hughes, of the Peninsular Stove Company, Detroit; N. A. Wilson, of the Cleveland Stove Company, Cleveland; D. A. Dangler, of the Dangler Stove and Mfg. Company, Cleveland; Wm. M. Lottridge, of the Hull Vapor Stove Company, Cleveland; J. A. Marsh, of the Happy Tidings Stove Company, Cleveland; F. A. Mehling, of the Schneider & Trenkamp Company, Cleveland; W. C. North, of the American Vapor Stove Company, Cleveland; C. A. Pope, of the Aurora Vapor Stove Company, Cleveland; F. L. Alcott, of the Standard Lighting Company, Cleveland. The first day was taken up with the address of President Geo. M. Clark and the dispatch of preliminary business. Mr. Clark's address was as follows:

Gentlemen and members of the Vapor Stove Manufacturers' Association: The anniversaries of great events in the history of nations, corporations or individuals may be so observed as to be of specific value, as they serve to emphasize truth, warn of danger or chronicle success. Were it not for such mile stones as New Years and the anniversaries of our birth, who knows but what time might slip by at such a giddy, unmarked rate that we would be octogenarians before we realized that we had rounded our thirties and millionaires or bankrupts before it had occurred to us to take account of stock. Unfortunately, perhaps, time does not slip by so easily, and we are continually brought up against corners, which serve to remind us that he who does not bestir himself will most certainly be left far behind in this race which we call life. Retrospection and

reflection are not always agreeable, but, sometimes, like bitter draughts prescribed by the wise physician, they lead to health. Happy is he who, like this association, of which I deem it an honor to be a member, is called upon to indulge in little besides congratulation.

Allow me in brief words to review the progress of the manufacture of vapor stoves during the last decade and to ask and partially answer the questions, Where do we as an association of vapor stove manufacturers stand today, and what is our reasonable hope for the future? Figures speak with emphatic voice. In 1878 and 1879 1000 vapor stoves of inferior quality were made. Since that date the yearly increase has been from 5000 to 10,000, until in 1887 over 100,000 were made and sold. For 1888, without doubt, the number manufactured will reach from 120,000 to 125,000. The sale is increasing in the New England States, in California and the South. Owing to the security against accident given by continual improvement in construction, the prejudice of insurance companies to the use of gasoline stoves is gradually yielding, and, in time, will undoubtedly disappear.

Surely it is admissible that in the freedom of this gathering we should congratulate ourselves upon our substantial progress and standing. I quote, for our satisfaction, these words from a recent address before the National Association of Stove Manufacturers: "We, as manufacturers of a legitimate line, must conclude that it has been thoroughly demonstrated that gasoline and vapor stoves materially decrease our spring sales in the line of cook stoves and ranges." I believe that our association rests on a solid basis. Every effort should be made by the members to insure the strict maintenance of prices and discounts. Quite a number of regular stove manufacturers and jobbers have had a gasoline stove made for them, they themselves having no practical knowledge of the construction, or of the necessity of the most accurate workmanship on burners and correct construction throughout. This has been the occasion of some complaints which have reached me, to the effect that prices have been cut by jobbers. This cutting has arisen from jobbers having purchased a larger quantity of stoves than they have been able to dispose of, or the quality has not been up to standard. To meet this difficulty, therefore, I would suggest a smaller discount to jobbers than has heretofore prevailed, hoping that this will lessen the number of jobbers and thereby lessen the temptation to cut prices.

Allow me to say a word in regard to a subject with which the very air seems charged. I refer to trusts. Copper trust, tin trust or corner—what need is there of a trust on an article that is not even produced in this country except in very small quantity—lead trust, iron trust, soap trust, glass trust, linseed-oil trust, &c., &c. A trust on a metal or any manufactured article is usually for the purpose of reducing production and thereby forcing prices to a point above the normal. This is adverse to the public interest, and in the nature of things cannot continue. Allow me to quote from a recent writer on the trust system: "Only a short time will be required to develop its weak points, and, notwithstanding popular apprehension, it will be found that such combinations cannot rise superior to supply and demand, action and reaction, world-wide competition, and all the natural forces, which, though silent, are sovereign and continuous. There are penalties for the violation of natural laws, and, though often apparently slow, they are sure, because inherent in the nature of things. Indirect, regulative influence and unexpected compensations make their presence felt, and finally assert their supremacy over all artificial combinations."

I believe we can as an association so reduce the list price on our goods that the consumer can procure a gasoline stove or range at a lower price than heretofore. With a smaller discount to jobbers, the manufacturer would receive the same price for his goods sold through a jobber as formerly. I would recommend a reduction from our present list of* each on all high stoves, and* each on the regular junior. I would also recommend the discontinuance of the manufacture of all cheap junior stoves. No doubt your several committees have come prepared to report on matters which are vital to the interests of our association. I hope we can begin work at once and that this annual meeting arrange a list of prices, with discounts that can be maintained.

The following officers were elected for the ensuing year: President, A. S. Phelps; vice-president, Wm. Lottridge; secretary and treasurer, Garson Myers; Executive Committee, Geo. M. Clark, Geo. Kahle, D. A. Dangler, F. A. Mehling and F. L. Alcott.

* The speaker omitted to fill in the blanks representing reductions.

The report of the Executive Committee was taken up section by section and its consideration occupied the remainder of the day and the sessions of the day following until adjournment. The question of prices was thoroughly discussed and conclusions were reached on every point raised. In the new list for next year the so-called step stoves are made to list \$17, \$19 and \$21 respectively for the two, three and four burner, which prices are for the stove only. The prices on two, three and four burner stoves, with ovens attached under the top, were reduced \$1 each from the list price of last year. The stoves made with self-lighting or heating tube attachments will be listed 50 cents higher than stoves without attachments. The regular and quantity discounts remain the same as last year. It is the purpose of the association to acquire the control of the Consolidated Vapor Stove Company, and with this in view a committee was appointed to confer with that company on a form of contract which the members of the association agreed to, and which it is believed will be accepted by the company. If this is consummated the licensing power and control of the association will be in the hands of the manufacturers of vapor stoves instead of with the Consolidated Company, while all litigation and enforcement of the licenses will rest with that company, who will be controlled by a litigation committee composed of two members of each body, and if they shall not be able to agree on a policy, an application is to be made to some judge of an Ohio Court to appoint a fifth member of the committee, with power to cast a deciding vote. Measures will be taken to insure the enforcement of the agreement which are expected to be equally efficacious with both the manufacturers and the jobbers.

There were present at the session on Thursday morning Walter B. Mosman, of the Pratt Mfg. Company, 26 Broadway, New York, a branch of the Standard Oil Company, and O. J. Benham, of the naphtha department of the Standard Oil Company, both of whom were interested in the further development of the vapor stove business in providing an increased channel for the consumption of gasoline. Mr. Mosman made some remarks relative to the use of vapor stoves in New England and other Eastern States. He showed that the prejudice which had been supposed to exist in that section against vapor stoves was entirely due to a lack of information among the people relative to an article so different from anything they had heretofore used, and not to the hostility of the insurance companies. Under proper regulations the insurance companies permitted the use of gasoline, and it rested with the manufacturers of vapor stoves to acquaint the people of the East more thoroughly in relation to their use, and thus advance their mutual interest. He had no doubt that if the necessary steps were taken by manufacturers and jobbers to instruct the people in regard to the merits and advantages of vapor stoves a larger consumption of them would follow in the Eastern States. At the conclusion of his address the president was directed by vote of the association to appoint a committee to act with Mr. Mosman in this matter.

From information given by those present at the meeting it is believed that the quantity of vapor stoves made and sold in this country during the season of 1888 was easily 20 per cent. more than last year. The character of the stoves sold this year reached a higher degree of perfection than at any time in the past. In new territory, such as Texas and other Southern States, also throughout New England and other Eastern States, vapor stoves are getting a strong foothold by means of the introduction of the small, or as commonly called

cheap, junior stoves, which are meant to take the place of kerosene stoves, that have had such a large sale in the sections referred to. Wherever the small gasoline stoves have been sold for one or more seasons a good market is opened up for the full-fledged latest-improved gasoline stoves. The hope was expressed at this meeting that the stove dealers of the East would investigate for themselves the real merits of the vapor stove and be convinced of their own volition and not wait for the manufacturers to remove their doubts.

As the formation of a vapor stove trust has been talked about to some extent, and it was expected that definite action of some kind would be taken at this meeting, it should be stated that the matter was discussed, but all efforts in that direction were abandoned, as the scheme was demonstrated to be wholly impracticable. There will be no trust in vapor stoves so long as the present manufacturers have control of the trade.

The next semi-annual meeting of the association will be held at St. Louis on the first Tuesday in March, 1889.

Louisville Trade Items.

The following reaches us from Louisville under date of the 18th inst.:

The volume of the Hardware trade of Louisville, Ky., is not only up to that of last week, but is gradually increasing. The tone of the market has improved, and the large forces of clerks in the jobbing houses are kept unusually busy for this season of the year shipping out orders. Prices are still too low, with no prospect of a general advance. Sharp competition was instituted by the manufacturers early in the season, and it results in the jobbers practicing among themselves what they learned from such a demoralized school. But as each and all the dealers are well satisfied with the status of trade, and say that business is good, no one can censure them for giving their customers the benefit of low-priced goods. In fact, it is better so; the farmer gets very small returns for his work, investments of money and labor, and it is but right that he should be able to buy cheap tools and implements.

As some manufactured goods, such as Cut Nails, Bar and Sheet Iron, become a little scarcer, and the demands on the jobbers' stocks continue to increase, the dealers acquire more confidence and are quietly placing large orders, covering future probable needs. The manufacturers will not gain anything by further concessions, and now that many of them will be affected by the advance in Pig Iron the buyers hope to see them hold firm. An occasional healthy tone is given to the trade, like the recent advance in Lead, which has netted a snug sum to those dealers who were not afraid to buy at the right time. One house alone purchased eight or ten carloads of Shot; half of this they have sold at the advance, with the balance held in reserve on the approach of the best season. Lead has been selling too low, not sympathizing with Copper and other metals, and the present rise is owing to greatly reduced output, caused by low values. Other Ammunition is being taken in and shipped out in large quantities, especially Blasting Powder, this city being the source of supply for a large territory in railroad and mining operations, and considerable amounts of Blasting Powders are used in the extensive limestone quarries through this region.

Cut Nails are going out in good lots from store, and many stocks are being depleted. Some of the regular mills are unable to fill orders, as their stocks are badly broken, machinery idle and likely to remain so until prices improve a little. Wire Nails hold their own well, the store orders increasing. Barb Wire shows a large consumption, not for political fences, however, as the approaching canvasses might indicate; it is too dangerous a thing to straddle, but marks a steady improvement in putting up cheap and durable fencing.

The Outlook for Stoves.

The Metal Worker of last week speaks as follows as to the outlook of the Stove trade:

With the prospect of a large fall demand for stoves, it is not strange that leading manufacturers should be anxious about the maintenance of prices. We believe that prices are being sustained in almost all directions, although occasionally we encounter the announcement of what might be considered a step calculated to demoralize the trade. For example, a Western foundry in a trade circular referred a short time since to the reduction in cost of Pig Iron

as being a reason why stoves can be sold more cheaply at the present time than formerly. The sober second thought of every manufacturer and dealer must be to convince him that the slight reduction in Pig Iron can have but very little effect in the cost of Stoves. Pig Iron, while it is the principal material entering into Stoves, by no means represents their entire cost. Price of Stoves, in view of all the circumstances attending the trade, are low at the present time, rather than high, and buyers very generally are willing to pay the prices that are asked. What the dealer is most concerned in is that prices should be maintained. It is demoralizing to the trade to meet figures later in the season that are lower than those which were demanded when the earlier stock of goods was bought. Many Stove foundries, in order to avoid the rush of the fall trade, are urging their customers to send in early orders. This suggestion is being acted upon by many to the mutual advantage of all concerned, and for their protection as well as for other reasons prices should not fluctuate.

Arrangement of Stores.

The accompanying illustration, Fig. 261, shows a method of ceiling hangings adopted by J. P. Casselman, Grand Forks, Dak., which will be recognized as a modification of a plan we have heretofore described. The cut shows stringers made of 1-inch lumber, 2 inches wide, which run lengthwise to the store. They are suspended to the ceiling by $\frac{1}{2}$ -inch iron rods screwed in the ceiling, the lower end be-

Fig. 261.—Arched Ceiling Hangings.

ing bent so as to hold the stringers. These rods are about 7 feet apart. The outer stringers are placed on the lowest down, the others rising as they approach the center, thus making an arch which when filled with Tinware and similar goods that can be appropriately hung up is referred to as presenting a fine appearance and giving a store the effect of being heavily stocked. Common screw hooks are placed in the stringers at such distances as the ware requires, 6, 9 or 12 inches apart. Connecting the ends of the stringers, as shown in the cut, is referred to as improving the effect, giving it more the appearance of an arch.

Convenient Rule for Marking Goods.

From time to time during the past few months there have appeared in these columns a number of communications from correspondents on the general subject of system in the marking of goods usually carried in stock by the retail dealer. Those who follow this practice put such prices upon their goods as will secure in one case 25 per cent., in another 33 $\frac{1}{3}$ per cent., and perhaps in still another 40 per cent. The task of computing the price at which an article must be sold to return a certain percentage profit, while not difficult, consumes valuable time, and any means looking to facilitating the operation cannot fail to be appreciated. It also happens that the dealer may attend an auction sale and desire to bid upon certain lots of goods which are offered by the dozen. Now, in buying, says an exchange, he knows exactly what one of these articles will retail for in the market where he deals; and, unless he is a good accountant,

it will often take him some time to determine whether he can make a living profit by buying them at a given figure and selling them by the single article at market price. In buying his goods by auction, as the merchant often does, he has not the time to make the calculation before the goods are bid off. He, therefore, loses the chance of making good bargains by being afraid to bid at random, or if he bids, and the goods are cried off, he may have made a poor bargain by bidding thus at a venture. It then becomes a useful and practicable problem to determine instantly what per cent. he would gain if he retailed the article at a certain price. To tell what an article should retail for to make a profit of 20 per cent.:

RULE.—Divide what the article cost per dozen by ten, which is done by removing the decimal point one place to the left.

For instance, if shovels cost \$17.50 per dozen, remove the decimal point one place to the left, making \$1.75, what they should be sold for each to gain 20 per cent. on the cost. If they cost \$31.00 per dozen they should be sold at \$3.10 each, &c. We take 20 per cent. as the basis, for the following reasons: Because we can determine instantly by simply removing the decimal point, without changing a figure, and if the goods will not bring at least 20 per cent. profit in the home market the merchant cannot afford to purchase, and should look for cheaper goods.

The reason for the above rule is obvious. If we divide the cost of a dozen by 12, we have the cost of a single article; then if we wish to make 20 per cent. on the cost, we add the per cent., which is $\frac{1}{5}$, to the $\frac{1}{12}$, making $\frac{1}{6}$ or $\frac{1}{5}$; then as we multiply the cost divided by 12 by the $\frac{1}{5}$ to find at what price one must be sold to gain 20 per cent., it is evident that the 12s will cancel and leave the cost of a dozen to be divided by 10—to do this remove the decimal point one place to the left. As removing the decimal point one place to the left, on the cost of a dozen articles, gives the selling price of a single one with 20 per cent. added, and, as the cost of any article is 100 per cent., it is obvious that the selling price would be 20 per cent. more, or 120 per cent., hence to find 50 per cent. profit, which would make the selling price 150 per cent., we would first find 120 per cent., then add 30 per cent. by increasing it one-fourth itself; for 35 per cent. increase it one-eighth itself, &c. Hence to mark an article at any per cent. profit we may use the following:

GENERAL RULE.—First find 20 per cent. profit by removing the decimal point one place to the left on the price the articles cost per dozen; then, as 20 per cent. profit is 120 per cent., add or subtract from this amount the fractional part that the required per cent. added to 100 is more or less than 120. Merchants, in marking goods, generally take a per cent.—that is, an aliquot part of 100, as 25, 33 $\frac{1}{3}$, 50, &c. The reason they do this is because it makes it much easier to add such a per cent. to the cost—for instance, a merchant could mark almost a dozen articles at 50 per cent. profit in the time it would take him to mark one at 49 per cent. The following is arranged for the convenience of business men in marking the prices of all articles bought by the dozen.

New Champion Force Pumps.

The New Champion force pump, manufactured by Clark Bros., of Belmont, N. Y., is well known to the trade, and has heretofore been illustrated in these columns, but some of the late improvement brought out by this firm will be of special interest to pump dealers, and particularly those having trade in pumps for drilled wells. The accompanying cut, Fig. 1, represents a pump designed for drilled wells of 4-inch bore and larger. It is constructed with an outer case or shell, in which the upper brass cylinder is suspended. This case or shell is just large enough to pass readily into 4-inch casing. The discharge-pipe, and a pipe on the opposite side serving as an additional support to the working parts of the pump, are screwed into the upper end of the shell

Fig. 1.—New Champion Drilled Well Force Pump.

and are connected above to a cast-iron standard of neat design, and which has been constructed with a view to securing the greatest strength with the least weight of material. The firm have been using this form of standard on all their force pumps for the past two years. The operation of this pump is the same as that of

the regular New Champion, one-half the water being discharged in the up stroke of the handle and the other half in the down stroke, and the stream is made continuous by means of the hollow piston-rod

Fig. 2.—New Champion Set Length Force Pump.

air-chamber. The use of the outer case or shell is to inclose the upper cylinder and form a waterway around it to communicate with the discharge-pipe, and also form a connection for the well-pipe, which communicates with a lower cylinder placed at or near the bottom of the well. This lower cylinder is either seamless brass or iron, porcelain lined, as may be preferred by the user; but whether of brass or iron it is always fitted with a brass valve seat. This pump is also fitted with windmill attachment. Fig. 2 represents a pump constructed on the same general plan as Fig. 1, but having the upper and lower cylinders both contained in the case or shell, thus adapting it to be used as a set-length pump for shallow drilled wells. The firm also manufacture a pump having the same working parts as in Fig. 1, but slightly modified in form to adapt it for wells of smaller bore than 4 inches.

Tanner's Patent Telephone Attachment

Among the specialties brought out by the E. S. Greeley Company, No. 5 Dey street, New York, is Tanner's patent telephone attachment, a general view of which is shown in the accompanying illustration. The general shape of the attachment, as well as its peculiar features, are so well displayed in the cut that but few words of explanation are necessary. It will be noticed that it is provided with an air chamber separate from the speaking-tube. The broken part in the cut shows the extension of the speaking-tube, while surrounding it is the air-chamber. The perforations in the back are said to relieve

the concussion and avoid the rattling of the transmission diaphragm, which destroys the value of the sound vibrations produced by the voice. With the use of this attachment it is claimed that conversation can be carried on in an ordinary confidential tone. The device is made of brass, nickel-plated and highly polished. As will be seen by the cut, no screws are required to fasten it in place, as it clamps automatically to the transmitter box. This device

Tanner's Patent Telephone Attachment.

has been on the market comparatively a short time, but, judging from numerous testimonials, it has already met with considerable favor.

Foot-Power Scroll Saw.

The W. F. & John Barnes Company, No. 71 Ruby street, Rockford, Ill., are directing attention to recent improvements which they have made in what they call their No. 7 Foot-Power Scroll Saw. While the general appearance of the machine is not materially changed, the patent perforated belt, of which the company

Barnes' No. 7 Foot-Power Scroll Saw.

make a specialty, has been added, taking the place of other devices not so satisfactory for use. This belt, the company inform us, has the great advantage of driving positively, and yet running so slack over the pulleys that there is very little friction in the transmission of the foot-power. The arrangement of the working parts of the improved machine is simplified, and a less number of parts is used. The company claim that the profit on running one of these machines on ordinary scrollwork at usual rates will pay for the machine in a very short time.

New Coal and Ash Sieve.

A very convenient arrangement for sifting coal and ashes has recently been devised by Mr. H. S. Brewington, of Baltimore, Md., and is being offered the hardware trade by the manufacturers, Messrs. Brewington, Bainbridge & Co., of that city. In Fig. 1 of the engravings herewith presented is shown the device ready for use, except that the drawers

Coal and Ash Sieve.—Fig. 1.—General View of Device with the Two Drawers Pulled Out.

should be closed. In Fig. 2 the coal is being turned from the cylinder into the top drawer. In the construction of this sifter the box at the top is made of wood and provided with a perforated bottom made of galvanized iron. This is made to revolve by means of a spindle, running down through the center of the box and attached to the bottom of the sieve, and is

Fig. 2.—Showing Method of Dumping Contents of Box After Ashes Have Been Sifted.

operated by the crank shown in the engraving. The top drawer is provided with a perforated bottom, which also serves as a sieve, while the lower drawer has a tight bottom to hold the ashes. In operating the device the coal and ashes are turned into the box or cylinder containing the revolving mechanism. The cover is closed and the contents are agitated by turning

the handle above referred to. The ashes are thus sifted through the bottom of the box, and falling through the first drawer, which is provided with a sieve base, are retained in the lower drawer, from which they may be easily removed. The box is then tilted and the coal is dumped into the top drawer ready for use in the stove. The manufacturers claim that by means of this device a hod of coal or ashes can be sifted in 15 seconds; that it is easily managed, allows no dirt or dust to escape into the room, and will save enough coal to pay for itself in a very few weeks.

The Diamond Finished Razor Strop and Case.

Some new features in a razor strop and case have been produced by Horton, Gilmore, McWilliams & Co., of Chicago, as shown in the accompanying cut. The strop is made of the finest quality of genuine Russian leather, and the preparation with which the leather is coated is what its name implies—"Diamond finished." It is designed to produce the most perfect edge that can be put upon a razor. The case for this strop, as will be seen by the cut, is a new departure. When the sharp, keen substance of the red side of a strop gets mixed with the coating on the black finishing side, the strop is spoiled for putting on a perfect edge. This is what always occurs when the old style of case is used,

Razor Strop and Case.

unless particular care is taken each time on inserting the strop in the case. The new form of case overcomes this objection and forms a perfect protection for the strop. It will be seen that the strop is directly lifted out or put back without rubbing the coated sides. Being hinged at one end, the cover is raised by the act of withdrawing the strop. When the case is closed the strop is held securely in place by friction upon the shank of the handle. The trade-mark and the form of the case are protected by copyright granted to the firm of Horton, Gilmore, McWilliams & Co.

Tuerk's New Hose-Band Clamps.

The Tuerk Water Meter Company, of Syracuse, N. Y., are putting on the market Tuerk's new hose-band clamps, two views of which are shown in the accompanying illustrations. An important claim made for this clamp is that it can be relied upon to stand any pressure without getting loose or allowing the hose to leak. Fig. 1 illustrates the clamp screwed partly together. It will be very easily noticed that the special feature of the clamp is the overlapping tongues which slide together between the lugs, thus forming a continuous band and holding the hose as securely between the lugs as at the

other parts of circumference. The tongues and clamps are cast all in one piece, one tongue projecting from each lug of the clamp. In Fig. 2 the clamp is shown drawn tightly around the hose. The tongues at C force themselves between the hose and the clamp, and keep the hose

Tuerk's New Hose-Band Clamps.—Fig. 1.—Clamp Screwed Together.

pressed down firmly, thus preventing all danger of coming off or leaking, which was the objection encountered in the old style of clamp. Tuerk's hose-clamps are made in 11 different sizes, from $\frac{1}{4}$ to 3 inches inclusive, and are manufactured to

suit different ply hose. The Tuerk Water Meter Company will also manufacture odd sizes where desired.

The city of Providence by the free use of water meters has reduced the consumption of water to 38.9 gallons, about two-

Fig. 2.—Clamp in Position on Hose.

fifths the American average in our cities. The use of meters is secured by making the water rate to those who put them in about two-thirds of what it is to those who use water without a meter. The expense of providing the meters is small and their inspection costs little.

Improved Ventilating Register.

A novel ventilating register, a general view of which is shown in the engraving presented herewith, is being placed upon the market by the Chicago Heating and Ventilating Company, of 205 West Madison street, Chicago, Ill. The device is the invention of Ira J. Ordway, president of the company, and is so arranged as to allow air to pass from the room into the ventilating flue, but prevents the air moving in the opposite direction. Referring to the engraving, A represents wooden slats to which flexible valves B are attached. The various slats, A, are fastened to the rod C at their rear side, after the same manner as ordinary window shutters are attached. The lever D, shown in the up-

Ordway's Ventilating Register.

per part of the engraving, is firmly attached to the upper wooden slat. By means of the lever B, in connection with the thumb-screw E, the slats A can be placed or set as to regulate the quantity of air that shall be delivered into the ventilating flue. The ventilator is constructed of cast iron with a face finished in japan, nickel or bronze as may be preferred. It is attached to a wooden frame in which the slats are pinioned at its face. On the front of the slats are fastened the floating valves B, made of oil silk or other light flexible material, which entirely cover the inner face of the register when they are closed upon it by a down current of air, but are carried back by the movement of the air when the current is from the room into the flue. The inventor claims that ventilation is greatly facilitated by this device, as the air being held in the flue instead of forcing its way into the room soon becomes warmer than the outside air, and thus establishes an upward current, which draws with it the air from the room.

Improved Hollow Punch.

Some time since we directed attention to the self-centering hollow punch introduced by W. J. Rothweiler, of Newport, Ky. Quite recently the tool has been very materially improved, and is now being put out in the form shown in the accompanying engraving. The cutter is made removable and accordingly is interchangeable. As is well known to all metal workers the cutting edge of a hollow punch suffers from two causes—first, from the effort to dislodge punchings that have been forced into the cavity, and, second, from sheer carelessness or abuse. The

first of these, it is claimed, has been rendered impossible in the present tool by the automatic extractor. On the other hand, the damage from carelessness, however severe, with the use of this punch necessitates ordering simply a new cutter, and does not make it necessary to throw away the entire tool as is the case with other articles of its kind. By this means two-

Improved Hollow Punch.

fifths of the cost, it is claimed, is saved. The other good points about the tool embrace the following: Four sizes of handles answer for all sizes of cutters, and a change of cutters may be made in a few seconds of time. Referring to the engraving, it will be noticed that there is a projecting point or center, which makes it very convenient to locate the punch at the desired point to be cut. With the old style of punch this was very difficult to do. The shank is of octagon cast steel as at present manufactured; it was formerly made round. The cutters, which were formerly in one piece, are now in two and are made of English cast steel. The centering pin is 1 inch long.

Clark's Patent Wasting Faucet.

The E. Stebbins Mfg. Company, Springfield, Mass., are putting on the market Clark's patent Self-Wasting Faucet, a sectional view of which is shown in the accompanying cut. Referring to the

head of the screw that holds the packing of the spindle there is a small hole opening into the air-chamber above mentioned. When the water is turned on it enters through this hole into the small air-chamber in the bottom of the spindle and presses the rubber packing against the small hole in the side of the air-chamber so that the appliance works like an ordi-

nary compression bibb. When the water is turned off at the stop in the basement, or wherever it may be located, the pressure being off the packing in the air-chamber, the air is at once drawn in through the nose of the bibb and the small hole inside of the air-chamber into the pipe, and all the water runs out at the waste of the stop in the basement. The bibb, however, not being opened is ready for the water when it is again turned on, thus giving it the double advantage of avoiding the danger of water remaining in the pipe and freezing, and also of water escaping from the bibb left open when the water is turned off, and not closed when the water is again turned on. The manufacturers inform us that the cost of Clark's patent Self-Wasting Faucet is but a trifle more than an ordinary bibb. They also state that they furnish samples upon application.

A syndicate composed of a number of well-known capitalists of Pittsburgh are negotiating for the purchase of the Uni-

Sectional View of Clark's Patent Self-Wasting Faucet.

illustration, it will be noticed that the lower part of the spindle of the bibb is drilled out, leaving a small air-chamber just above the seat, and there is also a small hole opening into the nose of the bibb. On the inside of this air-chamber there is a small piece of rubber packing covering the entire surface. Through the

versity building in that city. If successful the structure will be torn down and a magnificent building similar in architectural construction to the Lewis block will be erected thereon. The new structure will be six stories high, and it is proposed to make it one of the model office buildings of the city.

THE IRON AGE

THURSDAY, AUGUST 30, 1888.

The Ericsson Sun Motor.

In view of the attention which the application of solar heat to motive power purposes has recently received in France, a contribution which the distinguished engineer, Capt. John Ericsson has just made to *Nature* will be read with special interest. It relates to his sun motor, to which he has given a good deal of time and attention within the past few years, and through his courtesy we are enabled to present engravings of it this week, together with his description.

India, South America and other countries, says Captain Ericsson, interested in the employment of sun-power for mechanical purposes, have watched with great attention the result of recent experiments in France, conducted by M. Tellier, whose plan of actuating motive engines by the

piston of the motive engine: Fig. 1 represents a perspective view of a cylindrical heater and a frame supporting a series of reflecting mirrors composed of narrow strips of window glass coated with silver on the under side. The frame consists of a light structure of wrought iron or steel, provided with transverse ribs, as shown by the illustration, each rib being accurately bent to a parabolic curvature whose focus coincides with the axis of the cylindrical heater. It need hardly be stated that the mirrors supported by the said transverse ribs continue from side to side of the frame, which accordingly resembles a parabolic trough whose bottom is composed of mirrors. It will be readily understood that this trough, with its bent ribs and flat mirrors, forms a perfect parabolic reflector, to which a cylindrical heater, as stated, may be attached for gen-

which Tellier's apparatus, tested at Paris, was intended to displace.

DESCRIPTION OF THE ILLUSTRATED REFLECTOR.

1. The mirrors which reflect the solar rays are devoid of curvature, being flat narrow strips of ordinary window glass, cut to uniform width and length, perfectly straight.

2. The under sides of said strips are coated with silver by a process which prevents the action of the sun's rays from destroying the silver coating as in ordinary looking glasses.

3. The mirrors supported by the bent metallic ribs extending from side to side of the parabolic trough are held down by the heads of small screws tapped into the ribs. Thin slats of wood may be introduced between the mirrors and the ribs—

Fig. 1.

THE ERICSSON SUN MOTOR.

direct application of solar heat has been supposed to be more advantageous than the plan adopted by the writer of increasing the intensity of the solar rays by a series of reflecting mirrors. The published statements that "the heat-absorbing surface" of the French apparatus presents an area of 215 square feet to the action of the sun's rays, and that "the work done has been only 43,360 foot-pounds per hour," furnish data proving that Tellier's invention possesses no practical value.

The results of protracted experiments with my sun motor, provided with reflecting mirrors, as stated, have established the fact that a surface of 100 square feet presented at right angles to the sun at noon in the latitude of New York during summer develops a mechanical energy reaching 1,850,000 foot-pounds per hour. The advocates of the French system of dispensing with the "cumbrous mirrors" will do well to compare the said amount with the insignificant mechanical energy represented by 43,360 foot-pounds per hour developed by 215 square feet of surface exposed to the sun by Tellier during his experiments in Paris.

The following brief description will give a clear idea of the nature and arrangement of the reflecting mirrors adopted by the writer for increasing the intensity of the solar heat which imparts expansive force to the medium propelling the working

erating steam or expanding the gases intended to actuate the piston of the motive engine. Regarding the mechanism for turning the reflector toward the sun, engineers are aware that various combinations, based on the principle of the "universal joint" may be employed.

Concerning previous attempts made in France to utilize solar energy for mechanical purposes, it is well known that practical engineers, having critically examined Mouchot's solar engine, which M. Tellier proposes to supersede, find that it is incapable of developing sufficient power for any domestic purpose. Again, the investigations carried out by order of the French Government, to ascertain the merits of Mouchot's invention, show that irrespective of the great expense of silver-lined curved metallic reflectors for increasing the insufficient energy of direct solar radiation, these reflectors cannot be made on a sufficient scale for motors having adequate power to meet the demands of commerce; nor is it possible to overcome the difficulty of rapid wear of the delicate silver lining of the metallic reflectors consequent on atmospheric influence, which after a few hours of exposure renders their surfaces tarnished and ineffective unless continually polished. A glance at the accompanying illustration (Fig. 1) shows that the reflector constructed for my sun motor differs altogether from that originated by Mouchot,

an expedient of some importance in localities where the reflector is exposed to high winds.

4. It needs no explanation that the reflecting surface of the mirrors cannot become tarnished by atmospheric influence, since the bright side of the silver coating is permanently protected by the glass; hence it will be only necessary to remove dust from the mirrors, an operation readily performed by feather brushes secured to light handles of suitable length.

5. The frame of the reflector, being composed of rolled bars of iron or steel, requires no finish, excepting the top of the transverse ribs, which must correspond accurately with a given parabolic curvature. It should be observed that the needed accuracy is readily attained by a cutting tool guided by a bar of proper form.

6. Regarding cost of construction it will suffice to state that manufacturers of glass, both in the United States and Germany, supply the mirrors, cut to exact size and silvered, at a rate of 60 cents per square foot, the weight being 106 pounds per 100 square feet. Consequently the cost of the reflector and heater for the sun motor will not much exceed that of a steam boiler and appurtenances, including chimney. The cost of the engine, apart from the reflector, will not be greater than that of an ordinary steam engine.

7. With reference to durability it will be evident that the light metallic frame with its mirrors, and a heater acted upon only by reflected solar heat, will last much longer than steam boilers subjected to the action of fire, soot and corrosion.

Let us now briefly consider the distinguishing feature of the sun motor—namely, the increase of the intensity of the sun's radiant energy by parallel rays and flat reflecting surfaces permanently protected against atmospheric influence. It has been supposed that the lens and the curved reflecting surface, by converging the sun's rays, could alone increase the intensity of radiant heat. But Newton's demonstration, showing that the temperature produced by solar radiation is "as the density of the rays," taught me to adopt in place of curved surfaces and converging rays, flat surfaces and parallel rays, as shown by Fig. 2, which represents a transverse section of part of the reflector. The direct vertical solar rays, it will be seen, act on the mirrors, while the reflected rays, divided into diagonal clusters of parallel rays, act on the heater, the surface of which will thus be exposed to a dense mass of reflected rays, and consequently raised to a temperature exceeding 600° F. at noon during ordinary sunshine.

The cost, durability and mechanical energy of the sun motor being thus disposed of, it remains to be shown whether the developed energy is continuous or whether the power of the engine changes with the increase and diminution of zenith distance and consequent variation of atmospheric absorption. Evidently, an accurate knowledge of the diathermancy of terrestrial atmosphere is indispensable to determine whether the variation of the radiant energy is so great that the development of constant power becomes impracticable. Of course, manufacture and commerce demand a motor developing *full power* during a modern working day of *eight hours*. Observations relating to atmospheric diathermancy, continued during a series of years, enable me to assert that the augmentation of solar intensity during the middle of the day is so moderate that, by adopting the simple expedient of wasting a certain amount of the superabundant heat generated while the sun is near the meridian (as the steam engineer relieves the excess of pressure by opening the safety valve), a uniform working power will be developed during the stipulated eight hours. The opening of the safety valve, however, means waste of coal raised from a great depth at great cost, possibly transported a long distance, while the radiant heat wasted automatically by the sun motor is produced by fuel obtained from an inexhaustible storehouse free of cost and transportation.

It will be proper to mention that the successful trial of the sun motor, described and illustrated in *Nature*, vol. xxxi. p. 217, attracted the special attention of landowners on the Pacific coast then in search of power for actuating the machinery needed for irrigating their sun-burnt lands. But the mechanical detail connected with the concentration at a single point of the power developed by a series of reflectors was not perfected at the time; nor was the investigation relating to atmospheric diathermancy sufficiently advanced to determine with precision the retardation of the radiant heat caused by increased zenith distance. Consequently no contracts for building sun motors could then be entered into, a circumstance which greatly discouraged the enterprising Californian agriculturists prepared to carry out forthwith an extensive system of irrigation. In the meantime a simple method of concentrating the power of many reflectors at a given point has been perfected, while the retardation of solar energy caused by

increased zenith distance has been accurately determined, and found to be so inconsiderable that it does not interfere with the development of constant solar power during the eight hours called for.

The new motor being thus perfected, and first-class manufacturing establishments ready to manufacture such machines, owners of the sun-burnt lands on the Pacific coast may now with propriety reconsider their grand scheme of irrigation by means of sun power.

Domestic Motive-Power by Atmospheric Exhaustion.

The system of power distribution by creating a partial vacuum in the supply mains, as developed in Paris, France, has

causing a slight draft, which aids the pump. Water is injected into the cylinder to obviate the rise of temperature which would otherwise occur from the compression of the rarefied air to atmospheric pressure. The pump is worked by direct connection with a horizontal Corliss condensing steam engine of 90 horsepower, making 36 turns per minute, and working with an initial steam pressure of 4½ atmospheres, cutting off at one-fifth. The efficiency of the pump is estimated at 98 per cent. of the power transmitted. The maximum demand for power, supposing all the motors to be at work at the same time, is 35 horse-power.

It can be proved that, with a perfect machine, 1 c. m. of air entering the main produces 13,530 kg. of work. In practice the air cylinder utilizes 93 per cent. of the

THE ERICSSON SUN MOTOR.

been referred to in *The Iron Age* several times since operations in connection with it were first commenced. In the last issue of the *Excerpt Minutes* of the proceedings of the British Institution of Civil Engineers, however, we find additional particulars originally contributed to the *Bulletin* of the Société Industrielle de Mulhouse by M. E. Dollfus. From these we take the following:

The principle consists in maintaining a vacuum, averaging 67 per cent., or 20 inches of mercury, but occasionally reaching to 75 per cent., or 22½ inches, in a reservoir serving to regulate the pressure in the pipes. The air-pump, an ordinary compressor working reversely, consists of a cast-iron cylinder, on the ends of which the suction-valves and discharge-valves are mounted. The piston, also of cast-iron, is formed with several grooves in the circumference, the two outer grooves being fitted with india-rubber rings. These rings are pressed against the cylinder by air passing through the piston. The valves are of india-rubber. The exhaust reservoir is 49 inches in diameter, 11½ feet in length. The air is discharged into a sheet-iron chimney, by which it is

power transmitted; of this proportion the exhaust motors in turn give a maximum of 60 per cent.; the loss of head in the main is 5 per cent.; lastly, the air yields only 85 per cent. of its total capacity for work. The resulting coefficient is 45 per cent., and the actual work of 1 c. m. of air is $13,530 \times 0.45 = 6088$ kg. (44,034 foot-pounds). From the exhausted reservoir a main is laid in the sewers or in trenches, and is provided with as many branches as necessary. A junction is made with the pipes for each subscriber, who is furnished with a special stop-cock.

The principal pipes are of cast iron, in lengths of 1 m., and of varying diameter, 10 inches and 8 inches from the pumping station to the sewer, and 8 inches and 4 inches in the sewer or trench. They are from 0.25 inch to 0.40 inch in thickness. The joints of the pipes are run with lead against an india-rubber ring, and calked in the usual way. The conduits do not exceed from 1 mile to 1½ miles in length. Greater lengths than these induce very sensible losses of head; hence the necessity for creating a series of centers. Condensation water in the pipes is not provided against, as the water carried by the atmospheric air vaporizes under the low pres-

ure. But, on the other hand, the air, in entering the conduit, expands rapidly and falls in temperature, when the entering moisture may freeze and clog the motors. For such a contingency the company decline responsibility.

By the secondary motors the pressure of the air is converted into work at once utilizable by the operator. Motors of three types have been employed—oscillating, rotative and trunk. The first has fallen into disuse, in consequence of waste by leakages. The operator simply turns a tap to start the engine, no further attention being necessary while his motor is at work. The rotative motor is specially constructed for small powers of from $\frac{1}{2}$ to $\frac{1}{4}$ horse-power. The trunk engine is employed for powers of from $\frac{1}{4}$ to 1 horse-

power varies from 0.114 cent to 1.32 cents per 1000 revolutions, or from 1.77 cents to 10 cents per hour. The hygienic advantage of the exhaustion motor in promoting ventilation is obvious.

New 15-Inch Shaper.

We show on this page a new 15-inch shaper, built by Messrs. Lodge, Davis & Co., of Cincinnati, Ohio. The stroke of the tool can be changed and adjusted while running. When the end of the ram is at the end of motion of 15 inches it has a bearing in the column slide of 21 $\frac{1}{4}$ inches. Being operated by a crank motion, the stroke of the shaper is at all times positive, and it will invariably plane to a line,

NEW 15-INCH SHAPER, BUILT BY LODGE, DAVIS & COMPANY, CINCINNATI, OHIO.

power. The efficiency of the motors varies from 40 per cent. to 60 per cent., according to the size of motor used. The number of revolutions of each motor is registered by a counter, in which a roller turns in contact with a friction-plate, at a greater or less radial distance from the center of the plate, according to the pressure developed. Thus the variation of pressure is compensated for by the registering of a greater number of turns relatively as the pressure is augmented and a less number as it is reduced.

The economy effected by the use of these domestic motors is exemplified by the case of a brush-maker, who works a saw and five drilling lathes. Now, with a $\frac{1}{4}$ horse-power motor, five men do the work of eight employed previously, and the expenditure is about 60 cents per day for the motor-power, against about \$3 for three men. In another case, that of the manufacture of tortoise-shell combs, two lathes are employed, to drive which a man was formerly paid \$1 per day of ten hours. Now, with a motor, the cost for power is only 50 cents per day. The charge for power of from $\frac{1}{2}$ horse-power to 1 horse-

making it a particularly desirable tool for diemakers where accurate work is required. The vise is swiveled, and may be transferred from the top of the table to the side, adapting the machine to a larger range of work. The vise opens 8 inches, is 2 inches deep and 10 inches wide. With each machine is furnished an improved box table. Work can be bolted on the top and both sides. Being made in this form it has in addition a degree of stiffness not possessed by one-sided tables. It can also be utilized as a receptacle for tools, &c. The table may be removed and the work bolted to the slotted apron to which the box table is attached. This is desirable in planing the tops and sides of heavy pieces, such as legs of machines, &c. The machine is heavily geared, giving great power with high-belt velocity. The gears are well proportioned, and are cut from the solid; the machine has a vertical adjustment of 18 inches, and a cross motion of 18 inches. The tool block has 5 inches feed in any direction. All the bearings are accurately scraped to a fit. The machine has four changes of speed, and weighs 1500 pounds.

Solid Drawn Copper Tubes.

At the Glasgow Exhibition the Tharsis Sulphur and Copper Company exhibited cylindrical copper billets used for making solid drawn tubes by a process invented by Mr. James Robertson. These billets are usually about 30 inches long and from 4 inches to 7 inches diameter. *Industries* describes the process as follows:

In practice, a hole 1 $\frac{1}{4}$ diameter is bored right through the billet by drills from either end. The billet is then lightly skinned in a lathe to clean the surface, after which it is inclosed in a cast-steel container made in halves and bored out to suit the particular size of billet. This container rests on a stout bed plate, and remains stationary while a pear-shaped mandrel attached to a revolving hydraulic ram is entered at one end of the hole in the billet. A flexible tube inserted in the other end of the hole supplies lubricant. On pressure being applied to the revolving ram which carries the mandrel, the metal of the billet gradually flows back in the container, in front of the mandrel, and in a few minutes the mandrel pierces the elongated billet, leaving a shell having the original outside diameter, but with a hole corresponding to the size of the mandrel. A sample cut in halves shows the operation partially completed. After annealing, this shell is ready for drawing hot in rolls, or cold in the usual draw benches. The temperature of the shell or mandrel never exceeds 120° F., and the only waste occurring in the process is the 1 $\frac{1}{4}$ -inch hole through the center of the billet, and the surface cleaning. This hole, however, is only a convenience and is not an essential, for very frequently tubes are pierced out of the solid, it being only a question of a little more power and a somewhat longer time.

Oval billets are produced for another process of making solid drawn copper tubes, and measure 24 inches by 10 $\frac{1}{4}$ inches by 2 $\frac{1}{4}$ inches thick, which are rolled hot in the direction of the shortest diameter till they become circular disks about 30 inches diameter. By means of suitable dies and mandrels in a hydraulic press, and after annealing, these disks are cold worked successively into basins, conical domes, and ultimately into parallel tubes having one end closed. On punching out this closed end, a shell about 5 feet long remains for finishing on the draw benches, and, with the exception of the closed end, all the metal of the original oval cake is in the shell.

The Navy Department has invited proposals for the construction of one steel submarine torpedo boat complete, with torpedo fittings and appendages. The vessel is to be of the best and most modern design, and, so says the circular, must be constructed within the United States and of material of domestic manufacture. Bids will be received until January 4 next. Some time ago Messrs. Cramp & Sons made two propositions for the construction of a vessel of this description, but they were rejected because of failure to guarantee its serviceableness.

The trunk manufacturing interest of Louisville, Ky., is larger in the aggregate than at any other point in this country except Newark, N. J., and is principally carried on by three factories. To give an idea of the rapid growth of this industry: the firm of Laub, Stromberg and Kraus began work five years ago in an attic, or loft, employing five men altogether. To-day they have on their pay-roll 100 workmen, have a factory four stories high and covering about 200 x 400 feet of ground. Their orders are so numerous that they cannot take any more, and have called in their salesmen. Their trade extends all over this country and into Mexico.

The Cruiser Charleston.

In this issue we publish engravings of the first of the new cruisers, the Charleston, which was launched on the Pacific Coast a few weeks ago, the builders being the Union Iron Works, of San Francisco, Cal. Though we briefly described the vessel at the time, some of the particulars will bear repetition.

The Charleston has a central open superstructure, twin screws and two masts with military tops in which machine guns are mounted. She was built upon the plans of the swift Japanese cruiser Naniwa-Kan, built by Sir G. W. Armstrong, with such modifications as were rendered necessary by the conditions of the United States service and the substitution of 8-inch for 10-inch guns. The principal dimensions of the vessel are: Length over all, 320 feet; length on load line, 300 feet; breadth, 46 feet; mean draft, 18 feet 6 inches; displacement to mean load line, 3730. The indicated horse-power, with natural draft, is 5000; with forced draft, 7500. The maximum speed per hour is 18.9 knots. The crew will number 325 men. The vessel is double bottomed under engines and boilers. She has also a curved or turtle-back steel deck from 2 to 3 inches thick running from stem to stern and protecting everything below it, being a foot above load-water line at the crown and then sloping at its edges to 4 feet below the water. The coal bunkers are so arranged as to furnish further protection.

A chart and wheel house is built under the bridge, containing steering wheels, engine telegraphs, steering lever, indicators, speaking tubes to the conning tower and other parts of the vessel, folding chart-table, chart-lockers, telescope racks, &c. A conning tower is worked on the bridge. It is of mild steel, 2 inches thick on the vertical sides; the cover, $\frac{1}{4}$ inch. It is fitted with steering lever, engine telegraphs, indicator and speaking tubes. The floor has a grating for communication with the chart house.

Hydraulic steering gear is fitted to the vessel, with wheel or levers in the conning tower and chart house. The steering gear is placed under the protective deck, well below the water.

Two electric, incandescent, electric lighting plants are arranged to work on the same circuit, each capable of providing at least 3200 candle-power of light. The lamps are so placed as to fully light up all parts of the ship, including coal bunkers, magazines, shell and ammunition rooms, running lights and lights for use on deck and aloft. Provision is made for draining water from the storerooms, chain lockers, coal bunkers and all other compartments of the vessel to places from which the water can be pumped by hand or steam. The ventilation of the living and storage spaces is by the exhaust system, and while natural ventilation is used as far as possible, artificial exhausts are provided for all compartments below the spar deck by means of two blowers of 10,000 cubic feet capacity per minute. The foul air of the coal bunkers is led into the funnel casing, and the bunkers have fresh-air pipes with large mouths opening into the hammock berthing.

The horizontal plating of the protective deck is 2 inches thick, the sloping sides 3 inches.

The main battery consists of two 8-inch breech-loading rifles, mounted at each end of the superstructure in light barbettes about 3 feet high. Six 6-inch rifles are mounted on the same deck, three on a side, in projecting sponsons. The secondary battery consists of four 6 pounders, rapid-fire rifles, six Hotchkiss revolving cannon and four Gatlings. Four above-water torpedo guns or launching tubes are fitted. The motive power is furnished by two

THE U. S. CRUISER CHARLESTON, BUILT BY THE UNION IRON WORKS, SAN FRANCISCO, CAL.

The Main Deck.

horizontal compound engines placed in separate water-tight compartments and, as previously stated, developing 7500 indicated horse-power under forced draft. Each engine has a high and low pressure cylinder of 44 and 85 inches in diameter with a stroke of 36 inches. The crank shafts are a single forging of steel. The circulation and air pumps are worked by independent engines. The screws are three-bladed, about 14 feet in diameter. There are six main boilers in two separate water-tight compartments, all with one smoke-pipe. Those in the forward compartment are 11 feet in diameter, and in the after compartment, 11 feet 6 inches. Air is driven into each fire-room to maintain an air pressure of 2 inches of water. There will be a steam-starting and reversing gear, distilling apparatus, auxiliary bilge and fire pumps, ash-hoisting engines, a windlass for hoisting the anchor and for other heavy work, a steam winch for hoisting boats and light work generally, and steam turning gear for the main engines. The coal supply at normal draft is 328 tons, but the bunker capacity is 800 tons. The following table shows the endurance and radius of action at different speeds:

I. H. P.	Speed.	Coal per hour.	Distance can steam on 328 tons.	Distance can steam on 800 tons.	Coal per hour per I. H. P.
	Knots.	Tons.	Knots.	Knots.	Lbs.
7,650	18.9	7.51	805.14	2,012.85	2.2
6,000	17.5	5.62	995.75	2,491.12	2.1
5,000	16.5	4.46	1,183.71	2,959.60	2.0
2,750	13.0	2.45	1,897.93	4,244.89	2.0
1,200	10.0	1.07	2,990.60	7,476.60	2.0

Johnstown Freight Rates.

A few days ago the Baltimore and Ohio Railroad Company and the Pennsylvania Railroad Company entered into an agreement to make the same rates on iron from Johnstown, Pa., to points 100 miles from Pittsburgh as are in effect from Pittsburgh to these place. The new rates went into effect on Monday the 20th inst. The circular issued by the Baltimore and Ohio Railroad reads as follows: "Rates on articles of iron and steel manufacture, in full carloads, except on steel rails and fastenings, from Johnstown, Uniontown; Everson, Scottdale and Mt. Pleasant to all points west of Bellaire, will be the same as from Pittsburgh. The rates authorized in this tariff will also apply from stations between Johnstown and McKeesport, the latter not inclusive, and from stations between Mt. Pleasant and Uniontown." The tariff issued by the Pennsylvania Railroad Company is the same. In addition to the above taking effect at the same time, both roads reduced the rate on steel rails from Johnstown to Chicago from \$2.75 per gross ton to \$2.64, and from Pittsburgh to Chicago from \$2.50 to \$2.40. From this it will be seen that the advantage on steel rails to Western points is still in favor of the Pittsburgh manufacturers. Some of the Pittsburgh manufacturers complained that the railroads, by making the new rates on iron, were discriminating against Pittsburgh in favor of Johnstown, and they intimated that if the rates were not changed the matter would be taken before the Interstate Commissioners for settlement. The railroads, however, claim that they have not violated the Interstate law, since the law does no prohibit them from making the same rate for a long and short haul, but in no case are they allowed to make a lower rate for shorter than a longer one. The rates were made at the request of the Johnstown manufacturers. For points east of Johnstown the Pittsburgh manufacturers have been paying the same rates as the Johnstown manufacturers, and the new schedule was made in the endeavor to equalize the advantages of Pittsburgh over Johnstown on Eastern business.

The Cost of Machine Coal Mining.

Prof. H. A. Wheeler, of Washington University, St. Louis, has contributed to the *School of Mines Quarterly* an article on machine mining in the St. Louis coal regions, from which we take the following estimate of the cost of mining with the Harrison machine (Heavy Standard pattern) for a plant of about 400 tons daily capacity, which is about the usual size of the shipping mines in the Belleville district. In making up such an estimate as this, of course, only general figures can be given that will have an average value; local conditions will more or less modify these for any particular plant, while different seasons will cause considerable fluctuations in the principal daily expense, the labor item. Attention is called to one item of cost that is so very frequently omitted in engineers' estimates—viz., the pro rata that must be charged each year to return, as a sinking fund, the capital invested in the complete original outlay, besides the annual outlay in repairs that is required to keep this first investment in use. For not only must interest be charged against this cash investment (whether purchased through loans, mortgage or out of the cash capital), but the principal must be returned by the time the plant is worn out, which, in this case, is assumed to be at the expiration of ten years, except the machines, whose mean length of service is put at six years. The plant investment required to maintain such an output, for which eight machines will be necessary, is assumed to be as follows:

Plant Investment for an 8-Inch Machine Mine.

Compressor: 1 Compound Norwalk, 20 in. by 24 in. steam cylinder	\$3,000
Erection and housing of compressor	1,500
Air-Receivers: 1 main receiver, 4½ ft. by 12 ft.	\$380
Air-Receivers: 8 entry receivers, 1½ ft. by 6 ft. @ \$90	720
Piping: 500 ft. 5 in. shaft piping @ 54 cents	\$270
Piping: 2,000 ft. 3 in. main-entry piping @ 28 cents	560
Piping: 10,000 ft. 2 in. cross-entry piping @ 13 cents	1,300
Piping: 5,000 ft. 1½ in. room-piping @ 10½ cents	525
Total	\$2,855
Erection	885
Boilers: Two 50 horse-power boilers with complete fittings	2,000
Erection and housing of boilers	1,000
*10 Harrison Mining Machines, "Heavy Standard," including royalties, @ \$600	6,000
Hose: 8 pieces, 4-ply, rubber hose, 50 feet long, with couplings, @ \$40	320
Extra picks (8 @ \$5). Tools, &c.	800
Freight, incidental, &c.	1,286
Total	\$20,000

On this basis of an investment of \$20,000, which would be required to convert a hand mine into a machine mine (independent of all outlays for hoisting, pumping, ventilating and other machinery for general maintenance), the following estimate is made for the complete daily expenses of running a Harrison machine.

Running Expenses of a Machine per Day, with an 8-Machine Plant and 300 Working Days per Year.

	Cost.	Per cent. of whole.
Labor: 1 machine runner.. @ \$2.25		
1 machine helper..... @ 2.00		
1 blaster..... @ 2.25		
1 timberman..... @ 2.00		
4 loaders, @ \$1.75.....	7.00	
	\$15.50	77.6
Blacksmithing: 8 machine picks, @ 4 cents.....	\$0.32	
8 drill-augers, @ 1½ cents.....	0.12	
	0.44	2.2
Supplies: Powder, 10 lb @ 10 cents.....	\$1.00	
Oil and packing.....	0.00	
	\$1.10	5.5
Repairs: On machine, daily pro rata \$60.00.....	\$0.20	
300 days.....		
Hose and piping, pro rata \$60.00.....		
300 days.....	\$0.40	2.0

Compressor: One engineer	\$2.25		
One-half fireman.....	0.88		
Six tons slack coal, @ 15 cents.....	0.90		
Repairs and supplies to compressor.....	1.00		
Repairs and supplies to boilers.....	0.50		
Total for the eight machines.....	5.50		
Expense for one machine	\$5.50	\$0.69	3.5
Interest on \$20,000, @ 10 per cent. per machine for 1-300 year.....		0.84	4.2
Sinking Fund:			
\$14,000, @ ten years per machine, for 1-300 year.....	0.58		
\$6,000, @ six years per machine for 1-300 year.....	0.42	1.00	5.0
Total.....	\$19.97	100.00	

* 8 for use, 2 as "extras" during repairs.
† Including squibs and paper.

On a tonnage of 50 tons per day per machine, this total expense of \$19.97 gives a rate of 39.9½ cents, or, say, 40 cents per ton for undercutting, blasting and the labor of timbering and loading the coal on the mine cars, as against 50 cents a ton when this same work is done by hand miners. Where the seam is thin, or the coal poor in quality, less coal will be obtained from each machine, and as the expenses will remain about the same, it will make the rate higher; thus, on rooms that produce only 45 tons per day per machine, the rate per ton will be 44½ cents. The estimate is based on a year of 300 working days, which is the minimum that a mine should be worked to produce economically; but as the average working-year for the coal mines of Illinois in 1886 was 206 days, the cost of machine mining, when revised on a basis of 200 days of work for the whole year (to allow for shutting down during the dull season) is at the rate of 43.9½ cents on the 50-ton basis, and 48½ cents on the 45-ton basis, as the total daily expense is raised to \$21.82. The sinking fund charge is 5 per cent., and the interest is 4.2 per cent. of the total daily expenses on the 300-day basis; but the former is increased to 7 per cent. and the latter to 5.7 per cent. when the plant only works 200 days in the year.

A popular figure for the cost of a Harrison machine per day for power, repairs, interest and depreciation is put at \$2.50, or 5 cents to 5.7 cents a ton. This is too low, as will be seen from the estimate (\$2.98), though large plants working full time and having the cutting done by contract could probably work very close to the 5-cent rate.

Triple-Expansion Pumping Engines.

On the opposite page we present an engraving of an entirely new type of pumping engine, built last year by Messrs. E. P. Allis & Co., of Milwaukee, Wis., for the Milwaukee Water Works, a high duty pumping plant. The engine is of the triple-expansion class, being the first one for this kind of work built in America, and at the present time it is the only one of its kind in operation. The duty guaranteed for this engine was 115,000,000 foot-pounds per 100 pounds of coal burned, and the steam pressure to be carried was to be limited to 80 pounds. This guarantee we understand was easily exceeded in the official test, though made under very unfavorable conditions. A duty of 125,000,000 foot-pounds per 100 pounds of coal has been attained under ordinary conditions, burning Anthracite coal of only fair quality, no deductions of any kind being made. This duty is equal to 1.3½ pounds of coal, or about 13.5½ pounds of water per indicated horse-power per hour. The arrangement of the engine is what is termed in marine practice "fore and aft" compound, with three cranks, set 120° apart.

The steam is supplied by ordinary cylindrical tubular boilers without any special setting. Each cylinder has two piston rods, which connect to a forged steel

cross-head, connected directly to the pump plungers below by means of four distance rods, which straddle the crankshaft, so that the motion is transmitted directly from the steam pistons to the pump plungers without passing through journals of any description. The three steam cylinders are 20 inches, 35 inches and 40 inches respectively in diameter by 3 feet stroke, and are fitted with the Reynolds-Corliss valve gear, with independent, adjustable cut-off gear for each. They are jacketed and connected by large receivers, which also serve to tie the machines together rigidly. The bed plates of the high and low pressure engines stand on stone piers, while the center or intermediate one rests upon the tops of the suction and discharge air chambers. The entire machine is so accurately balanced and so self-contained that even when running far above the contract speed there is said to be no perceptible vibration.

The pumps shown in the engraving, beneath the floor of the engine room, are of the single-acting, outside-packed-plunger type, with double-beat Cornish valves, arranged in annular chambers, outside of the plunger barrels. The delivery of the pumps is so steady that they have been run a week at a time without any air in either of the air chambers and without the slightest shock upon the pipes or pumps. The nominal pumping capacity of the engine is 6,000,000 gallons in 24 hours against a head of 60 pounds, but it has been operated with a capacity of nearly 9,000,000 gallons without difficulty. It has done the entire work of the Milwaukee high service station for nearly a year and has never been stopped necessarily during that time, excepting for a few minutes at night in order to pack piston rods or valve stems.

Messrs. Allis & Co. are at present building five engines similar to the one illustrated for the new Chicago Water Works plant, which will have a nominal capacity of 15,000,000 gallons each against a head of 125 feet, but are guaranteed to deliver 18,000,000 gallons each per day without overloading. They are also building four triple-expansion pumping engines of a somewhat different style for the City Water Works of Albany, N. Y., which will have a daily capacity of 5,000,000 each, against a head of 310 feet.

Among the monster pumping engines in course of construction at the Allis Works especially worthy of notice is the plant for the City of Milwaukee, to be used for flushing the river which passes through the center of the city. The outfit is to deliver 350,000,000 gallons of water per 24 hours from Lake Michigan into the river, above the city.

The channel span of the new Chesapeake and Ohio railroad bridge in course of erection between Cincinnati and Covington, collapsed on Sunday morning with a tremendous crash. The disaster was caused by the accumulations of drift during the recent high water against the trestle or false-work of the bridge. The span which collapsed was 100 feet high, and on top of it was a "traveler." The structure was weighted with some freight cars loaded with pig iron and other heavy material, besides 700,000 pounds of bridge iron, to make it steady. The loss is estimated at \$90,000, and will fall on the Keystone Bridge Company, of Pittsburgh. A Cincinnati dispatch says: "Superintendent Milliken had exhausted all known resources to avoid the catastrophe. A large pile protector had been anchored above the span, with two lines of booms formed of coal barges, dividing the heavy masses of driftwood and sliding the bulk of it under the completed span on the south shore of the river or between the north-most pier and the Ohio shore, where the superstructure has not yet been begun."

TRIPLE-EXPANSION PUMPING ENGINES AT THE MILWAUKEE WATER WORKS, BUILT BY MESSRS. E. P. ALLIS & CO.

The Cruiser Baltimore.

The cruiser Baltimore, which was launched on Tuesday last at the works of Messrs. William Cramp & Sons, at Philadelphia, is a steel twin-screw ship, fitted with a heavy steel protective deck. She has a length over all of 335 feet, while between perpendiculars she measures 20 feet less. She has a beam of 48 feet 6 inches and will draw 19 feet 6 inches with all her battery, stores, provisions and coal on board. This will give the vessel a displacement of 4400 tons. According to the contract requirements the Baltimore's engines must develop 7500 horse-power under natural draft, while with forced draft it is expected to bring the power up to 10,750, which gives the cruiser a maximum speed of 19 knots per hour.

The rudder and steam steering gear are placed below the water line, under the protective deck, worked from the chart-house and conning tower, so that in case a shot should strike the cruiser above the water line the steering gear of the vessel would escape uninjured. There are to be two masts fitted with military tops, but they

spaces by means of pipes, louveres and cowls. Artificial ventilation is also provided for all compartments below the living deck by means of two blowers of 10,000 cubic feet capacity per minute, so arranged as to exhaust from or force air to the several parts of the vessel, and to deliver it into the lower parts of the engine-room or the open air. A steam bilge pump has already been placed in each engine-room, with suction from the sea, the engine-room bilge, the ship's drainage system and the boilers each delivering into the fire main or overboard. The steam windlass, which is fitted on the forward gun deck, is worked by an independent engine. The main battery will consist of four 8-inch breech-loading rifles, mounted on the poop and fore-castle decks, 26½ and 28 feet respectively above the water. Besides these there will be six 6-inch breech-loading rifles, mounted 18 feet above the water in sponsons, having a train of 155° from the line of the keel for the forward and after pairs and a train of 130° for the guns in the waist. The secondary battery consists of six 6-pounders, rapid-fire guns, six Hotchkiss revolving cannon and four Gatlings. Five above-water launching

8	820	.65	15.60	192	4,905	25.60	10,445	54.40	1.80

will not be put in place until after the vessel has been launched and has all of her boilers and machinery in place. A large military top with bullet-proof armor will be erected on each masthead, fitted to hold modern machine guns of rapid fire. Hotchkiss revolving cannon or long-range single-barrel guns will be mounted here.

The coal supply of the new cruiser is 400 tons at her normal draft, while her bunker capacity is estimated at 850 tons. The Baltimore is intended to be a flagship, which will carry the commander-in-chief of the station to which the vessel may be attached. The engines are of the triple-expansion type, two in number, placed in separate water-tight compartments. The cylinders are 42, 60 and 94 inches in diameter, with 42-inch stroke. There are two three-bladed screws, 14 feet 6 inches in diameter. The boilers are ready in the shops now, and consist of four double-ended horizontal return tubular boilers, 14 feet 8 inches in diameter, each having at each end four corrugated furnaces 3 feet in diameter. Two electric plants of the most approved pattern, the lightest and most compact and best adapted for marine work, are ready to be placed aboard the vessel. The dynamos are each of 3200 candle-power, so constituted that lights 10, 16, 32 and 50 candle-power can be used on the same circuit, with an independent control over each lamp. All parts of the ship will be fully lighted by the incandescent lamps, including coal bunkers, magazines, shell and ammunition rooms, running lights and lights for use on the upper decks and aloft. Recourse is had to natural ventilation as much as possible for the living and storage

tubes or guns are fitted—two fixed tubes forward, firing directly ahead, and one fixed aft, and a training tube on each bow. An armored conning tower 3 inches thick is being fitted on the fore-castle with a horizontal cover 1 inch thick, with openings in the sides for outlooks. Engine telegraphs, a steering-wheel, an indicator and speaking tubes are to be within the tower. The appended endurance table of the ship will prove of further interest.

We are in receipt of the report of the proceedings of the twenty-first annual convention of the American Railway Master Mechanics' Association, held last June, and need perhaps scarcely emphasize the fact that it is in all respects a highly instructive and interesting little volume. Those who have even superficially followed the work of the association are well aware of its valuable character and will find this latest report to meet all their expectations.

William P. C. Whitaker, an old iron-maker, died recently at his home in Harford County, Md. His father and uncle were pioneers in iron manufacturing in America, and operated furnaces at Reading, Pa., Bridgeton, N. J., Wilmington, Del., and various other places. He carried on the manufacturing long after his father died, having furnaces at Principio and Havre de Grace, Md.

The new Holly Water Works machinery at Port Huron, Mich., is about to be put in operation. The entire plant cost \$222,000

The Chicago Crucible Steel Casting Company.

A new plant has just been erected in Chicago for the manufacture of steel castings by the Chicago Crucible Steel Casting Company. Their old works, located at 1326 to 1330 Indiana avenue, proved to be too small for the demands made upon them, and they have been abandoned and the equipment has been removed to the new location. The site of the new works is near the Elston avenue crossing of the Chicago and Northwestern Railroad, a branch of which road runs alongside the main building. The location was selected mainly on account of the excellent facilities which this railroad company give their patrons. It is conveniently reached by the trains on the Milwaukee division, all of which going north are obliged to stop opposite the works before crossing a draw-bridge over the Chicago River. In addition to their railroad facilities the company have good dockage on the river, which is navigable to Lake Michigan. The ground owned by them comprises four acres. The main building is a substantial structure, built of hand-made brick with a slate roof, one story high, and 220 feet long by 80 feet wide. It contains four double crucible steel furnaces of 12 pots each, one 8-ton open-hearth steel furnace, and one 3-ton iron cupola, together with gas producers, recuperators, &c. The cupola is intended for the manufacture of flasks, &c., for the company's own use, but may also be put into service for the production of special iron castings of a high grade. It has a capacity of 20 tons in 12 hours. Space has been provided for two additional open-hearth furnaces or for crucible furnaces, to be erected as the necessities of the business may require them. Six heats can be made in the crucible furnaces and four in the open-hearth furnaces every 24 hours. The present melting capacity is about 43 tons in that time. The furnaces were designed and constructed by John Zellweger, of Chicago. The principle on which his gas furnaces are constructed is, as explained by him, "the recuperation of heat," which is accomplished by the transfer of heat to the air entering the furnace to promote combustion of the gas, this air being sufficiently heated to melt cast iron before it comes in contact with the gas. The molding floor contains 8500 square feet and is served by four cranes, which reach every part of it. There is one 16-ton crane, two are 6-ton and one is 3-ton. The furnaces, gas producers, coal heat form, &c., are arranged in the part of the building nearest the railroad track for the convenient handling of raw materials.

Small crucible castings are poured on a molding floor, consisting of an elevated iron platform, 146 feet long by 20 feet wide, arranged on a level with the top of the crucible furnaces. Under the platform are four large drying ovens to dry the molds. These ovens are operated by waste heat from the furnaces, and are thus kept uniformly hot without any expenditure for fuel. A railroad track runs in front of the ovens, connecting by turntables with branch tracks in various parts of the building, and on which iron trucks are run to move heavy castings with a minimum of labor. A second building, 100 feet by 50 feet, contains the remainder of the plant, consisting of drilling machines, a pattern shop and a blacksmith's shop. Patterns received from other parties are stored away from the main building, so as not to be in danger of fire from the furnaces. A large tank, holding 80,000 gallons of water, which is pumped from the Chicago River, provides an ample supply at all times for the necessities of the works. Power is furnished by

two 50 horse-power engines. The castings manufactured by this company at their old plant on Indiana avenue have achieved for them an excellent reputation. They are made under a process perfected by Dr. J. W. Chisholm and Wm. Chambers early in the present year, after many months of careful experiments. These castings are soft enough to work under any tool, have been tested up to 70,000 and 80,000 pounds tensile strain, are practically free from blow-holes. They can be delivered in two or three days after the patterns are received, annealing being done away with. The promptness with which the company can deliver work is a strong recommendation to consumers, while the high character of their castings seems to be established by the testimonials which they submit from those who have given them orders. Orders are now in hand for steel castings from many parts of the United States. The officers of the company are as follows: Dr. J. W. Chisholm, president; William Chambers, secretary; R. W. Rathbone, Jr., treasurer. They maintain a city office in the Rookery Building, on the corner of La Salle and Adams street.

Wages in Iron Works.

The eager discussion now going on over every point involved in the questions affecting the tariff is bringing to us many inquiries concerning the wages paid in iron and steel works. Staggering statements are being made by those who would have the public believe that labor in our iron mills is poorly paid. No more striking illustration of this point, and of the great stupidity with which statistics have been perverted, has come to our notice than that of an article printed in the New York *World* of August 22d over the signature of T. E. Willson. This unknown manipulator of statistics has overhauled a number of industries, among them the manufacture of iron and steel, his guide being the census reports. He takes up in detail the blast furnaces, the bloomeries and forges, the rolling mills, Bessemer works, file makers and manufacturers of cutlery and edge tools. We need only dispose of the general table relating to iron and steel to show the methods employed. We quote:

The following table of wages paid in States will be found on page 1138 of the census:

State.	No. shops.	Average No. workers.	Total wages.	Average yearly wages.	Average weekly wages.
Alabama.....	14	1,626	\$571,713	\$351	\$6.75
California.....	1	319	177,722	556	10.69
Colorado.....	1	125	7,000	56	1.07
Connecticut.....	19	685	331,184	484	9.31
Delaware.....	9	867	344,476	397	7.63
District Columbia.....	1	18	7,527	418	8.14
Georgia.....	14	1,303	185,489	142	2.73
Illinois.....	21	5,253	2,508,718	477	9.17
Indiana.....	12	2,048	864,921	422	8.11
Kansas.....	2	630	166,500	264	5.08
Kentucky.....	29	4,095	1,344,500	326	6.27
Maine.....	3	700	141,494	202	3.88
Maryland.....	23	2,763	905,090	327	6.29
Massachusetts.....	30	6,513	2,576,539	395	7.59
Michigan.....	22	3,089	922,597	298	5.73
Missouri.....	22	3,139	734,575	234	4.50
Nebraska.....	1	100	50,000	500	9.61
New Hampshire.....	2	290	127,690	440	8.46
New Jersey.....	40	4,792	1,808,448	377	7.25
New York.....	89	11,444	4,099,451	358	6.88
North Carolina.....	20	63	7,907	126	2.42

Wyoming.....	1	184	79,650	433	8.32

Protection cannot prevent the wages paid in California, Connecticut, Illinois or Indiana from falling to the level paid in New York, nor the wages paid in New York and Pennsylvania from falling to the wages paid in Tennessee or Missouri. Are the latter high wages?

How can the bulwark of protection protect the Northern workman from the pauper wages of Georgia, North Carolina and Tennessee? It has not protected the workmen in Southern States from a reduction to foreign pauper wages. The Northern mechanic must look to something besides protection to keep his wages at their present level.

The first three columns are a correct reproduction of the census statistics; the last two have been computed by the eminent statistician who is their author by the simple expedient of dividing the total wages by the number of workers to get the yearly wages, and dividing the latter by 52 to reach the average weekly wages. The result ought to have struck even the editor of the *World* as amazing. In Colorado, where wages are high, the wretched ironworkers are content with \$56 a year, or \$1.07 a week. In Georgia their weekly compensation figures out \$2.73, and in North Carolina \$2.42. A moment's reflection would have taught Statistician Willson that the works making returns may have been in operation for only a fraction of the year. The same stupendous blunder runs throughout the whole article, and is all the more inexcusable because Mr. James M. Swank, the highest statistical authority in this country, has in his special census report furnished in detail the very data which Mr. Willson tried to get at in the ridiculous manner alluded to. We quote from page 47 of his report as special agent of the census:

Wages and Hours of Labor.

State.	Average No. of hours per w.k.	Average day's wages, skilled mechanic.	Average day's wages, ordinary labor.
Alabama.....	74	\$2.27	\$1.14
California.....	80	3.00	1.75
Colorado.....	80	4.00	1.75
Connecticut.....	84	2.74	1.27
Delaware.....	56	2.49	1.17
Georgia.....	63	2.19	.85
Illinois.....	63	3.43	1.27
Indiana.....	67	3.21	1.23
Kansas.....	56	3.00	1.25
Kentucky.....	69	2.73	1.13
Maine.....	65	2.47	1.15
Maryland.....	72	1.90	.96
Massachusetts.....	60	2.71	1.27
Michigan.....	70	1.92	1.25
Minnesota.....	60	2.00	1.50
Missouri.....	69	2.74	1.27
Nebraska.....	60	3.00	1.50
New Hampshire.....	57	2.00	1.19
New Jersey.....	63	2.32	1.21
New York.....	68	2.43	1.18
North Carolina.....	73	1.25	.54
Ohio.....	66	2.89	1.30
Oregon.....	72	3.00	1.50
Pennsylvania.....	66	2.32	1.13
Rhode Island.....	60	4.00	1.17
Tennessee.....	67	1.62	.88
Texas.....	60	2.00	1.00
Vermont.....	75	3.30	1.28
Virginia.....	61	1.73	.89
West Virginia.....	66	2.28	1.10
Wisconsin.....	74	2.07	1.19
District of Columbia.....	54	2.50	1.62
Wyoming.....	60	4.00	2.00
Average.....	65	2.59	1.24

If further confirmation were needed we need only point to the figures collected by A. S. Bolles, chief of the Bureau of Statistics of Pennsylvania, and published in the annual report for the year 1887. These figures, besides, have the merit of being more recent, though, of course, they cover individual cases only.

Wages in a Pennsylvania Iron Works, 1887.

Hours.	Rate per hour.	Total earnings.	Per cent. wages paid each class.
462,230.....	0.090	\$41,634.61	2.6
6,938,790.....	0.140	989,797.09	60.2
1,498,300.....	0.238	349,959.09	21.7
553,040.....	0.451	249,508.78	15.5
9,423,420.....	0.171	\$1,610,899.57

Mr. Bolles has, at the suggestion of the works, grouped the workmen according to their wages per hour into four divisions, the first including all who receive from 5 to 12 cents an hour inclusive, the second receive 12 to 20 cents, the third 20 to 33 cents, and the fourth class includes all

who are paid 33 to 65 cents an hour. The day is one of 10 hours throughout. Tabulated thus the employees stand as follows:

First classification.		Second classification.	
Per cent.	Received per day.	Per cent.	Received per day.
3.3	\$0.50	40.7	\$1.20
0.4	.61 $\frac{1}{2}$	0.8	1.25
3.8	.70	13.9	1.30
15.2	.75	5.6	1.35
12.1	.80	4.5	1.40
2.2	.85	2.6	1.45
12.1	.90	7.7	1.50
34.1	1.00	3.9	1.55
6.7	1.05	2.3	1.60
4.3	1.10	1.5	1.65
5.6	1.16	1.6	1.70
.....	3.3	1.75
.....	3.0	1.80
.....	4.5	1.85
.....	1.6	1.90
.....	2.0	1.95
.....	0.6	1.97

Third classification.		Fourth classification.	
Per cent.	Received per day.	Per cent.	Received per day.
17.1	\$2.00	16.5	\$3.10
10.8	2.08	7.2	3.25
7.7	2.10	5.6	3.33
6.0	2.15	5.1	3.42
4.9	2.20	1.4	3.50
5.7	2.25	0.9	3.58
1.8	2.30	1.2	3.60
5.6	2.35	9.4	3.62
1.6	2.40	2.1	4.01
4.1	2.45	1.4	4.23
7.7	2.50	21.3	4.29
1.2	2.55	0.9	4.60
2.2	2.65	1.5	4.70
2.3	2.70	2.3	4.90
1.1	2.75	3.4	5.08
1.3	2.79	5.2	5.35
3.8	2.87	0.8	5.50
1.7	2.93	3.3	5.80
3.4	3.00	0.7	5.95
1.8	3.08	4.2	6.21
1.5	3.10	2.3	6.42
2.0	3.20	2.5	6.47
4.7	3.23

WAGES IN A LARGE PENNSYLVANIA MILL.

Another large works have prepared the following statistics, which we have tabulated:

	Number employed.	Average number of days employed.	Wages per day.	Average earnings per year.	Average earnings three best men.
Puddlers.....	328	261	\$3.50	\$913.55	\$980.06
Muck rollers....	4	261	8.83	2,308.73
Muck weighers, shearmen and day hands about forge.....	118	232	1.73	506.77
Scrapers.....	2	249	4.11	1,024.16
Bottom furnace heaters.....	4	239	5.08	1,214.39
Blacksmiths.....	28	264	2.75	726.00	844.80
Blacksmiths' helpers.....	26	264	1.65	435.00
Millwrights.....	15	310	2.75	824.51*	1,069.11
Bolt, rivet and spike makers.....	15	309	3.70	1,144.36	1,445.29
Bolt department, miscellaneous hands.....	32	309	2.22	687.25	851.05
Boys in bolt department.....	30	309	.82	265.97	327.35
Chainmakers.....	38	308	2.50	770.00	986.63
Miscellaneous workmen, chain factory.....	19	308	1.96	603.68	657.06
Furnace boys, chain factory.....	34	308	.60	184.80	200.08
Machinists.....	127	306	2.70	828.12	1,061.80
Apprentices, machine shop.....	7	306	.83	324.94
Machine shop laborers.....	17	306	1.57	481.95
Molders in foundry.....	60	307	2.78	853.66	1,185.15
Apprentices in foundry.....	15	307	.97	289.39
Laborers in foundry.....	29	307	1.50	542.16
Bricklayers.....	10	309	3.80	1,174.20	1,526.56
Bricklayers' helpers.....	11	309	1.76	543.84	684.61
Pattern-makers.....	11	302	2.52	763.78	953.97
Pattern-makers' apprentices.....	4	302	.89	268.08	306.00
Carpenters.....	15	301	2.52	753.65	943.38
Engineers.....	24	307	3.16	969.79	1,116.09
Spool-engine boys.....	13	307	1.33	409.41
Miscellaneous workmen.....	283	282	1.40	394.80	483.75
Pull up boys.....	36	211	.65	137.15
Laborers in rolling mill.....	302	1.35	442.38*	526.50
Extra laborers in rolling mill.....	47	303	1.69	513.58	606.74

Stockers.....	37	309	1.55	711.86*
Teamsters.....	6	308	1.88	579.04	611.89
Watchman and furnace firemen.....	13	305	1.96	598.54	730.00
Railroad-track layers.....	14	301	1.69	510.13
Heaters, 16-inch bar mill, new mill.....	6	147	7.33	1,077.51
Finishers and roughers, bar mill.....	5	147	3.02	433.93
Rollers, bar mill.....	1	147	18.02	2,648.94
Assistant roller, bar mill.....	1	147	7.85	1,153.95
Heaters and helpers, bar mill.....	6	147	2.77	407.19
Catchers, bar mill.....	2	147	6.52	958.44
Catchers' roughers, bar mill.....	4	147	3.61	530.67
Pilers, chargers, hoop-up's, straighteners, shearman and helpers.....	10	147	3.78	555.66
Bridgeworks, skilled laborers.....	74	308	2.17	667.78	978.06
Laborers, bridge works.....	39	308	1.45	482.22*
Boys, bridge-works.....	7	308	.85	262.82
Rollers, 18-inch mill (pays help).....	1	261	2.18	5,705.30
Roughers, 18-inch mill (no help).....	8	261	4.67	1,219.38
Catchers, 18-inch mill (no help).....	2	261	9.47	2,471.07
Catchers' helpers, 18-inch mill (no help).....	4	261	4.37	1,140.98
Heaters, 18-inch mill (no help).....	6	261	9.95	2,598.04
Heaters' helpers, 18-inch mill (no help).....	6	261	3.84	1,002.10
Piler, charger, drag down, hook-up's, straighteners, shearman.....	32	261	3.63	947.43
Rollers, small mills, 8 and 9 inch trains (no help).....	5	230	11.66	2,681.80	3,055.33 (1 man.)
Assistant rollers, small mills, 8 and 9 inch trains.....	5	230	5.31	1,221.30	1,308.12 (1 man.)
Heaters, small mills, 8 and 9 inch trains.....	10	230	6.63	1,524.90	1,638.00 (1 man.)
Roughers, small mills, 8 and 9 inch trains.....	20	220	3.31	762.45	819.00 (1 man.)
Drag downs, small mills, 8 and 9 inch trains.....	10	220	2.00	460.00	477.00 (1 man.)
Boys, straighteners, scrapers, poke-in.....	40	230	1.20	276.00	285.60
Rollers, small mill, 10 inch (new, single turn).....	1	270	12.50	3,375.00
Assistant roller, small mill, 10-inch, (new single turn).....	1	270	9.54	2,575.80
Heaters, small mill, 10-inch (new, single turn).....	2	270	5.96	1,609.20
Roughers, small mill, 10-inch (new, single turn).....	3	270	2.68	804.60
Boy scrapers, poke-in and straighteners, small mill, 10-inch (new, single turn).....	4	270	1.20	324.00
Drag-downs, small mill, 10-inch (new, single turn).....	2	270	2.70	639.00
Roller, 12-inch bar train (new mill).....	1	179	14.95	2,676.05
Assistant roller, 12-inch bar train (new mill).....	1	179	5.91	1,039.99
Heaters, 12-inch bar train (new mill).....	6	179	5.42	970.18
Catchers, 12-inch bar train (new mill).....	2	179	4.74	848.46
Roughers, 12-inch bar train (new mill).....	8	179	3.19	571.01
Pilers, chargers, drag-downs, loop-ups, straighteners, helpers and shearers, 12-inch bar train (new mill).....	16	179	2.84	508.06

Roller, 12-inch bar mill.....	1	252	11.41	2,875.32
Assistant roller (paid by roller), 12-inch bar mill.....	1	252	4.76	1,199.52
Heaters (paid by roller).....	6	252	4.44	1,118.88
Catchers (paid by roller).....	2	252	4.78	1,204.56
Roughers (paid by roller).....	8	252	2.62	600.24
Piler, charger, drag-out, hook-up, straightener, shearman and helper.....	16	252	2.33	587.16
Roller, net earnings, 16-inch bar mill (re-modeled, part idle).....	1	232	9.29	2,255.28
Assistant roller, net earnings, 16-inch bar mill.....	1	232	5.01	1,182.32
Roughers and finishers, net earnings, 16-inch bar mill.....	5	232	2.76	640.32
Catchers, net earnings, 16-inch bar mill.....	2	232	4.16	966.12
Catchers' roughers, net earnings, 16-inch bar mill.....	4	232	2.31	535.93
Heaters, net earnings, 16-inch bar mill.....	6	232	4.68	1,085.76
Heater, helper, piler, drag-down, hook-up, straightener, shearman and helper.....	8	232	2.43	563.76
Roller at sheet mill, net.....	2	183	6.69	1,224.27
Heaters, sheet mill.....	2	183	5.08	929.04
Rollers, plate mill, net.....	2	204	7.35	1,499.40
Heaters, plate mill.....	2	204	5.61	1,144.44
Catchers and roughers, plate mill.....	4	204	2.50	510.00
Nailers.....	21	276	3.78	1,403.80	1,217.77
Nail feeders, boys.....	71	276	1.12	308.73	416.85
Rollers, nail mill.....	2	193	6.83	1,319.16
Catchers, nail mill.....	2	193	3.41	609.58
Heaters, nail mill.....	4	193	4.82	930.13
Roughers, nail mill.....	2	193	2.00	386.00

In considering the earnings of the men for the year it should be taken into account that the 16-inch bar mill was in operation only 147 days, being a new mill, that the 10-inch train is also now worked only single turn, and that only for a part of the year, the full year being 306 turns, and also that the 16-inch bar mill was re-modeled, and was therefore running only during a part of the year.

WAGES IN BESSEMER STEEL MILLS.

Below we reproduce a table given in the report of Mr. A. S. Bolles, the mill A having run 245 turns during the year. All the men work on a tonnage basis, except those marked with an asterisk:

Mill A—245 turns.				
Occupation or Kind of Workmen.	Number.	Average wages per day.	Earnings for each man for year.	
Metal wheelers.....	12	\$2.47	\$606.99	
Coke wheelers.....	4	2.24	549.45	
Holst boys.....	1	1.76	431.51	
Cupola foreman.....	2	4.47	1,066.04	
Cupola foremen helpers.....	2	2.96	719.18	
Cinder men.....	4	2.19	537.95	
Ferromen.....	2	2.34	575.35	
Vessel foreman.....	1	4.38	1,075.90	
Vessel foreman helpers.....	2	2.93	719.18	
Scrapers.....	4	2.03	497.68	
Vessel cinder men.....	4	2.06	503.02	
Steel pourers.....	2	4.38	1,075.90	
Pitmen.....	14	3.54	867.27	
Sanders.....	2	3.54	867.27	
Stopper setters.....	2	3.33	817.00	
First regulators.....	2	2.66	653.02	
Second regulators.....	6	2.03	497.68	
Ladle liners.....	2	3.28	805.49	
Ladle liners' helpers.....	2	2.72	667.40	
Pushermen.....	4	2.34	575.35	
Bottom-maker.....	1	3.40	834.25	
Bottom-maker helper.....	1	2.77	678.91	
Stopper-maker.....	1	2.93	719.18	
Pipe-fitter.....	1	2.93	719.18	
Pipe-fitter helper.....	1	1.76	431.51	
Rollers.....	2	5.50	1,347.57	

Roughers.....	2	4.12	1,010.88
Hookers.....	10	3.12	765.67
Shearman.....	2	4.12	1,010.88
Shearman helpers.....	8	2.77	679.36
Shearman buggyman.....	2	2.04	501.16
Heaters.....	4	5.50	1,347.57
Bottom-makers.....	2	3.40	835.27
Bottom-makers' helpers.....	2	2.27	556.85
Chargers.....	6	3.07	751.74
Covermen.....	2	1.70	417.68
Regulators.....	2	2.07	506.73
Rack boys.....	2	1.70	417.68
Heater helpers.....	6	3.40	835.27
Chargers.....	6	2.77	679.36
Blowing engineers.....	2	3.75	925.00
Reversing engineers.....	2	3.25	795.00
Fan engineers.....	2	2.30	560.00
Small locomotive engineers.....	*10	2.30	560.00
Laborers.....	*106	1.62	406.00
Millwrights.....	*3	3.90	1,170.00
Boys from 62½ cents to \$1 per day.....	*20		
Total.....	282		

Mill B is another large Pennsylvania works, the figures being for the Bessemer and blooming mill departments of the establishment:

Mill B, Converting Department, 304 Turns.

Occupation.	Number.	Average daily wages.	Yearly earnings.
Metal wheelers.....	9	\$1.92	\$588.95
Vessel hands.....	6	4.29	1,318.19
Pitmen.....	21	3.56	1,094.31
Ladle hands.....	9	3.55	1,089.96
Metal wheelers.....	33	3.16	989.75
Metal cupola hands.....	15	3.40	1,045.64
Trough hands.....	9	3.11	955.64
Spiegel cupola hands.....	9	2.92	886.67
Coke fillers.....	6	2.06	634.24
Holstmen.....	3	2.11	644.69
Cupola hands.....	3	1.89	581.29
Cinder men.....	15	3.13	961.96
Pulpit hands.....	6	2.50	766.93
Blowers.....	2	4.42	1,357.37
Stock weighmen.....	2	3.95	1,212.32
Bottom makers, No. 1.....	2	3.41	1,046.28
No. 2.....	2	1.97	606.16
Cupola repairmen.....	8	2.71	822.80
Stopper maker.....	1	3.02	929.50
Cupola cinder men.....	8	1.70	520.78
Metal gang.....	6	1.92	588.41
Engineers.....	2	2.96	906.80
Assistant engineers.....	4	1.49	456.48
Watertenders.....	6	2.70	829.25
Laborers (325 days).....	43	1.20	384.30
Ganister mixers (324 days).....	8		434.04
Second-class laborers.....	14	1.00	324.00

Mill B, Blooming Department, 307 Turns.

Occupation.	Number.	Average daily wages.	Yearly earnings.
Heaters.....	3	\$4.60	\$1,399.27
Heaters' helpers.....	39	3.53	1,073.43
Chippers.....	4	3.87	1,181.41
Screwmen.....	3	3.77	1,146.62
Front tablemen.....	3	3.67	1,121.14
Engineers at rolls.....	3	3.00	910.00
Inspectors.....	3	2.88	869.21
Back tablemen.....	3	2.76	839.70
Seamen, bookers, telegraphers and loaders.....	18	2.62	796.63
Pull-arounds.....	2	2.52	766.30
Markers.....	6	2.48	752.76
Watertenders.....	4	2.70	829.24
Furnace bottomers.....	4	1.80	548.40
Day laborers.....	18	1.20	382.56

This enumeration does not include foremen. The wages paid in the rail mill of the same works are given in the following table, which we have compiled from the same source.

WAGES IN A STEEL RAIL MILL, ON TONNAGE BASIS.

	No. employed.	Number days employed.	Average daily wages.	Yearly earnings.
Stockers.....	10	237	\$1.71	\$405.42
Heaters.....	20	237	4.22	988.48
Extra helpers.....	20	237	2.40	568.44

A glance along the columns of figures presented, covering, as they do, a wide field in iron and steel manufacturing, should be sufficient to prove that while the average wages paid in iron works are high, there are, in every mill, a number of positions which are unusually remunerative. The proportion of skill and labor is very large, indeed. Any one familiar with the wages question in American iron works knows that the examples chosen are not exceptional; that with fairly steady employment the earnings in the mills are large, compared with the sums earned in other industries.

THE WEEK.

There are 200 cases of lead poisoning in Newark, N. J., of which 20 are in St. Michael's Hospital. The prevalence of the disease is attributed to the use of beer drawn through lead pipes and "soft" drinks from bottles rinsed with shot.

A bridge-building firm in Philadelphia have received orders for structural iron amounting to over \$250,000 from the New Jersey Central. This is to replace the iron bridges on the line east of Bound Brook and on the Newark branch. The material is now being delivered.

The business sentiment of Chicago is reflected by the *Tribune*, of that city, which says: "The wealth of the Northwest has been increasing enormously for years past. Even during the period when the price of wheat was so low and many people demonstrated to their own satisfaction that the farmers were losing money, the buying power of the masses somehow grew greater and greater. How much more rapid will be the progress with wheat 10 or 15 per cent. higher, an abundant yield of corn and other agricultural products at least fully up to the average. It is in Chicago that the richest bloom of this prosperity will be seen. This city is the central point of exchange for the best parts of the West. The wheat of Dakota, the corn of Nebraska and the cattle of Wyoming will soon be converted into bank deposits, buildings and railroad tracks in and around Chicago. Every week sees the inception of some new enterprise of general importance in this city, and the early fall will witness an unwonted activity in pushing those schemes."

The large paper mill of Geo. A. Whiting, of Neenah, Wis., caught fire in the boiler room, and while the flames were in progress the iron bleach, filled with steam and rags, exploded when the cold water from the fire engines struck it, and 14 persons were killed by the fragments which were thrown in every direction.

The extensive chemical works at Bushwick, L. I., Buffalo, N. Y., and Bayonne, N. J., owned by Martin Kalbfleisch's Sons, will be sold by the receiver of that firm some time in October. The disagreements of the firm respecting the manner of doing business are the cause of the dissolution. In the days of the ex-mayor the property was worth several millions.

The approaching completion of the Mexican National Railroad line from Corpus Christi, in Texas, to the City of Mexico, a distance of 1205 miles, will signalize the opening of the second great line of transportation between the United States and the neighboring republic. From the main line there will be branches to the great mining region around Zacatecas and

other branches to Monterey, Salvatierra and Tlascala. A line is now also building by the construction company from Manzanillo, the first harbor on the Pacific Coast of old Mexico, thus initiating a through line to Corpus Christi. Guaymas, in Sonora and on the Gulf of California, is a fine harbor further north, but to reach it vessels from San Francisco are compelled to round Cape San Lucas, the southern point of Lower California, and then sail half up the gulf before Guaymas is reached. But Manzanillo is a magnificent harbor, and directly in the course of the San Francisco vessels. Another result promised is the opening of a fine harbor at Asonzas, on the Texas coast, where deep water is much needed.

The process of laying a submarine pipe in St. Louis Bay, parallel with the Northern Pacific Bridge, is described by the *Superior Inter-Ocean*: "The pipe, which is jointed on shore into sections sometimes 100 feet in length, is swung in a cradle made of barrels, and is then towed to the side of the scow, upon which the men and machinery are. The pipe is gotten in line, and the tackle blocks attached. The pipe is allowed to sink gradually by cutting the barrels at such places as will let the pipes descend in a horizontal position." About 1000 feet have been laid, and the work proceeds at the rate of 240 feet a day. Divers follow the pipe to the bottom in submarine armor, taking along tools necessary to complete the coupling, which is a device covered by patents.

The annual statement of the business of the Boston Post Office for the fiscal year ending June 30, 1888, shows that gross receipts were \$1,730,377 against \$1,657,273 last year; balance in favor of the Government, after defraying expenses, is \$1,047,000.

Determined action will be taken by the various labor unions to secure the repeal of the conspiracy laws of the State of New York. With this object a call has been issued for a conference of all the trade representatives at Troy, on September 17. As stated by the Central Labor Union the situation is as follows: "Our highest courts have decided that under the present laws it is a crime to organize for the purpose of shortening the hours of labor, regulating the employment of apprentices and that until those laws are repealed any of us may be sent to a felon's cell for refusing to work with a person who is objectionable to us, and that we cannot take united action in refusing to purchase the goods of an unfair employer—in short, we cannot combine for any purpose except that of maintaining or raising wages. Some of our most active members are now under indictment and liable at any time to be sent to jail for exercising what we have always considered to be our rights as men and American citizens."

All attempts to manufacture sorghum sugar profitably in this country are pronounced a failure. Prof. H. W. Wiley, the chemist of the Department of Agriculture, has just published a bulletin of the Chemical Division of the Department of Agriculture, giving, in a condensed form, all the important recorded analyses of sorghum, an abstract of recorded tonnage per acre of sorghum, yield of sugar per ton and other data concerning the merits of sorghum as a sugar-producing plant, and the conclusion reached is that the only hope for sorghum is in the production of a better raw material.

Emancipation in Brazil, as was to have been expected, seriously disconcerts the operations of coffee planters, who suddenly find themselves embarrassed by the absence of available labor and a lack of ready cash wherewith to liquidate the pay roll. A letter from Santos says the receipts of

coffee have been delayed by the want of hands on the plantations, the freedmen being "independent and lazy." Hands are wanted everywhere to mill the coffee.

Yellow fever in Jacksonville is gradually extending. A sanitary inspection of all trains from the South has been ordered before they are permitted to enter Washington, and arrangements have been made by which a special train will run between Jacksonville and Camp Perry, the refuge station in Florida.

The State Prison superintendent is disposing of the large amounts of raw material left on hand in the shops at Albany when prison labor was stopped, and storing away the machinery. No requisitions have yet been secured for convict goods.

The total imports into China in 1887 were valued at \$127,830,000, as against \$109,345,000 in 1886, an increase of \$18,485,000. The larger part of this increase is of cotton yarn and piece goods, mostly from England. Copper and opium imports also showed important increases. A heavy decrease was shown in the imports of refined petroleum. The total imports of this product were only 12,015,000 gallons in 1887, against 23,038,000 gallons in 1886. The total exports in 1887 were valued at \$107,325,000, an increase of over 11 per cent. on the preceding year. Tea, the only important export showing a decrease, fell off 5 per cent. in the quantity and 12 per cent. in the value exported. The exports of silk showed an important increase.

San Francisco papers notice the beginnings of the fall trade in all directions, and indications are considered very promising. "Our foreign imports to date," says the *Commercial Herald*, "exceed those of 1887 by about 22 per cent., the figures being \$30,549,504 for this year and \$25,051,646 for 1887. This in itself is a most convincing testimony of our increase in population and trade. Of a similar character is the result of the assessment of property throughout the State. The total assessed value of property for 1887 was \$908,119,480; for the present year it is \$1,083,333,328; showing an increase of \$175,213,848, or over 18 per cent."

A letter from Chicago says: "There is reported to be intense rivalry between two syndicates, each of which is anxious to have the credit of owning the highest commercial structure in Chicago. One of them started out to construct a 12-story building at Madison and La Salle streets. Then the Chamber of Commerce people decided to raise their roof to the height of 13 stories, and now the first-named party is said to have decided on 15 stories."

Engineer-in-Chief Melville, of the Navy Department, who went to sea on a six-hours' speed trial trip of the Swatara when she started for Brazil a week ago, reports that the engines worked exceedingly well, developing 1330 horse-power at one time, with 64 revolutions per minute of the screw. This is a greater power than was expected, but it could not be kept up until the firemen have greater experience with their work at forced draft.

The bill for the erection of an appraiser's warehouse in the city of New York, as finally sent to the President for his signature, provides for the purchase of a site at a limit of \$850,000 and the erection of a building at a cost not exceeding \$650,000. The Secretary of the Treasury is given discretion to purchase a site large enough to embrace a custom-house building as well as an appraiser's warehouse or to purchase two sites near each other for the two purposes. In this contingency the Secretary is authorized to pay \$2,000,000 for the site. It was estimated that the site of the present Custom-House could be sold for \$3,000,000.

MANUFACTURING.

Iron and Steel.

No. 6 furnace, of the Crane Iron Company, at Catsauqua, Pa., has been blown out for repairs.

The Bethlehem Iron Company, at Bethlehem, Pa., are testing the direct process of hauling the molten pig from the furnaces to the converters, and avoiding melting in the cupolas.

Among recent building permits issued at Cleveland, Ohio, were the following: Cleveland Rolling Mill Company, wire warehouse, \$8000; Otis Iron and Steel Company, new building, \$10,000.

It is reliably reported that the Jackson Iron Company, of Cleveland, Ohio, have definitely decided to remove their furnaces from Fayette, Mich., to some point where the difficulty in obtaining fuel will not be so great. As the company's ore mines are located at Negaunee, Mich., it is the impression that the furnaces will be removed to that point, although the matter has not been definitely settled as yet.

The Richardson Axle and Wheel Company, of Covington, Ky., have been chartered by B. F. Richardson, H. B. Lupton and others, with a capital of \$200,000.

Robert Walker, receiver of the Himrod Furnace Company, has leased the Himrod Furnace to the Mahoning Valley Iron Company, of Youngstown, who have taken possession of the property. The furnace is in fair shape, and, it is expected, will be put in blast this week. The lease is for only three months, the company using the product in their mills until their own furnace, the Hannah, now being rebuilt, is ready for operation.

In reference to the recent cessation of operations at the plant of the Penn Iron Company, Limited, at Lancaster, Pa., we have received the following advice from the company, under date of the 20th inst.: "Our works shut down its puddling department last week because the workmen refused to come out to work when called. We discharged them all and shut down the puddle mill for needed alterations. We are running the finishing mills as usual, and will start up the puddle mill when ready. The trouble with the men was because of certain discharges of some of their number that had previously been made for their inefficiency."

The report recently published that the cold die rolled steel department of the works of the Hartman Steel Company, Limited, at Beaver Falls, Pa., had been closed down on account of a lack of orders is without foundation. That department is in full operation with a fair amount of orders on hand.

The Ohio Valley Foundry Company, of Bellaire, Ohio, built a large addition to their works last year and are now considering the advisability of adding another building, which will almost double their present capacity and give employment to a large number of additional workmen.

The Lawrence Furnace Company, of Ironton, Ohio, propose to build a 30-ton furnace in the vicinity of their present idle charcoal furnace at Culbertson, Lawrence County.

Emma Furnace, of the Union Rolling Mill Company, at Cleveland, Ohio, which has been out of blast for some time undergoing repairs, was blown in again on Wednesday, the 22d inst.

The well-known firm of Hussey, Howe & Co., Limited, steel manufacturers, at Pittsburgh, have been changed to Howe, Brown & Co., Limited. No change in

the manufacturing departments will be made, and the general business will be conducted by the new firm in all its branches, as heretofore. The officers of the new firm are Jas. W. Brown, chairman; W. R. Howe, vice-chairman; G. A. Howe, secretary; T. H. Childs, treasurer. The interests of C. G. Hussey and the estate of his son, C. G. Hussey, have been sold to the other owners.

The Twenty-ninth Street Iron Works, of Carnegie, Phipps & Co., Limited, at Pittsburgh, which have been shut down for some time owing to the fact that a new foundation had to be put in, will resume within the next week. The new foundation was completed last week.

The Reeves Iron Company, of Canal Dover, Ala., signed the Amalgamated scale last week, and have resumed operations. The concern is a small one, giving employment to about 100 men.

Keel Ridge Furnace, of P. L. Kimberly & Co., Limited, at Sharon, Pa., has resumed operations after an idleness of some weeks for repairs.

The Whitaker Iron Company, of Wheeling, W. Va., signed the amalgamated scale last week and operations have been resumed. The firm manufactures sheet iron exclusively.

The Ella Furnace, at Middlesex, Pa., has been blown out and is being repaired. A new and much-improved hot blast is being erected, and a new 87-inch cylinder upright blowing engine will be placed in position and will take the place of the present engines. The Ella was built for a 90-ton per day furnace, but has frequently made from 120 to 128 tons per day.

The Henderson Steel and Mfg. Company, of Birmingham, have increased their 1½-ton experimental furnace to 3½ tons capacity. The first melt in the enlarged open-hearth furnace was made successfully on the 22d inst.

The pipe mill of the Reading Iron Works, at Reading, Pa., resumed on Monday after a lengthy idleness with 200 men, the employees having had restored to them 5 per cent. of the 10 per cent. reduction in their wages, made some months ago, with a promise that the other 5 per cent. will be restored soon.

Machinery.

The Webster, Camp & Lane Machine Co., Akron, Ohio, recently shipped one of their hoists, mill, engine and boiler, occupying two cars, to the Sheffield Furnace Company.

The Hussey Re-Heater and Steam Plant Improvement Company, of New York, have under consideration the building of a factory. Hitherto their work has been let by them on contract to outside parties, but the growth in their business has been such as to make it an object for them to manufacture their own goods, and with this in view Mr. Brewer is now seeking a desirable place at which to locate, erect shops and put in a plant. The capital stock of this company is \$100,000, and at the start from 30 to 50 skilled mechanics will be employed. This number will be increased as rapidly as the demand for their machinery will warrant.

Wm. H. Warren, of Worcester, Mass., builder of machine tools, report the following recent sales: To the Union Water Meter Company, Worcester, Mass., one radial drill, weight, 9000 pounds; shaper designed especially to plane brass, and so constructed as to cut 100 feet per minute; also, a new designed two-spindle boring and drilling or milling machine, with spindles at each end of machine, to enter work at each end at same time; to the Atlantic Works, East Boston, Mass., one

radial drill; Brown & Sharpe Mfg. Company, Providence, R. I., fourth radial drill and order for the fifth; Rhode Island Locomotive Works, Providence, R. I., one radial drill; Lane Mfg. Company, Montpelier, Vt., one radial drill; E. Kendall & Sons, Cambridgeport, Mass., one combination slotter, milling and drilling machine.

The National Pipe Bending Company, New Haven, Conn., manufacturers of the National Feed-Water Heater, report their orders for heaters for the last month very satisfactory. Among the heater sales are: One 500 horse-power to New Bedford, Mass.; one 100 horse-power to Willimantic, Conn.; eight heaters to Boston; one 100 horse-power for steam yacht; one 200 horse-power to La Fayette, Ind.; one 100 horse-power and 500 horse-power to New Haven, Conn.; two heaters to Westfield, Mass.; one 80 horse-power to Safford Springs, Conn.; two heaters to Ohio; three heaters to Minnesota, one heater to Dakota, one 500 horse-power to the West Indies; two heaters to Woonsocket, R. I.; one heater to Georgetown, Tex.; one 100 horse-power to Columbia, S. C.; one 200 horse-power to Pensacola, Fla.; one 80 horse-power to Darlington, N. C.; one 500 horse-power to Laredo, Tex.; six heaters to New York City; two 80 horse-power to Yonkers, N. Y.; one 400 horse-power to Edison Electric Company, Brockton, Mass.; and one 200 horse-power to Montreal, Canada. They have orders for one 1000 horse-power, one 600 horse-power, one 500 horse-power, one 300 horse-power, three 200 horse-power, all to be shipped before September 15; also orders for nearly 200 coils of iron pipe.

D. B. Cruickshank, dealer in machinery, Providence, R. I., reports the following sales of machinery: An 80 horse-power Corliss engine to the new Russell Gold Mining Company, Glenbrook, N. C.; a 15 horse-power hoisting engine and boiler to Whitaker & Smith, Fall River, Mass.; a 10 horse-power hoisting engine to Grant & Co., Westerly, R. I.; a 20 horse-power engine and boiler to the Arlington Mining Company, Arlington, R. I., and an 80 horse-power Wheelock engine to B. B. & R. Knight, River Point, R. I.

Miscellaneous.

The Youngstown Car Mfg. Company, of Youngstown, Ohio, have closed down their works for a short time for the purpose of making repairs and adding improvements that will considerably increase their capacity for production.

The Carondelet Zinc Works, in St. Louis, were sold to Chas. D. McCloose for \$16,000.

Hardware.

The works of the Newcastle Wire Nail Company, at Newcastle, Pa., are being operated to their utmost capacity in order to keep up with the demands made on the company for their goods. Their works contain 65 nail machines, which are all in constant operation, and this number will shortly be increased by the addition of a number of new machines, which have just been ordered from abroad.

Messrs. Kreamer, Muir and Mitchell, the committee of adjusters appointed by the 38 insurance companies in which the Reading Hardware Company were insured, met the officers of the company and settled the claim. There were 41 policies, aggregating \$205,000, upon 29 subjects of insurance. The loss was confined to 17 of these subjects, on which the insurance amounted to \$170,110, and the total loss on 13 of these subjects aggregating \$155,710, was settled. The work of rebuilding will now be commenced by L. H. Focht, and is to be finished by January 1.—*Reading (Pa.) Times*.

The Iron Age

New York, Thursday, August 30, 1888.

JOHN S. KING, - - - BUSINESS MANAGER.

Foreign Iron and a Revival Here.

Lately a somewhat better tone has developed in the iron markets abroad, and those who are operating on the bull side have been making strenuous efforts to secure co-operation on this side of the Atlantic. Proposals to get up pools in Scotch warrants on a 10 per cent. margin have been made, with the object of booming the Glasgow market with the fiction that heavy buying for consumers has again begun. It is argued that with an American demand, added to other encouraging features in the situation, prices cannot help moving upward, while, without aid from us, the course of values is uncertain, with little prospect of a very rapid rally.

The wily Scotchmen who calculate in the manner indicated understand pretty thoroughly what a valuable customer the United States is when enjoying one of its spurts of activity. The following table will illustrate this fact. It gives the English exports for the first seven months to all countries, the exports to the United States during the same period and deducting the latter from the former, the exports to all countries except the United States:

<i>English Exports of Iron and Steel, Gross Tons.</i>			
Pig iron:	1887.	1888.	
All countries.....	650,688	608,279	
United States.....	249,972	90,222	
Countries outside U. S.	400,726	518,057	
Bar, angle, bolt and rod:			
All countries.....	143,686	173,989	
United States.....	1,651	3,091	
Countries outside U. S.	142,035	170,878	
Railroad iron and steel:			
All countries.....	459,915	597,429	
United States.....	92,941	39,723	
Countries outside U. S.	466,974	557,706	
Hoops, sheets, &c.:			
All countries.....	180,102	231,756	
United States.....	17,330	21,723	
Countries outside U. S.	171,772	210,033	
Tin plates:			
All countries.....	207,435	225,016	
United States.....	156,738	167,882	
Countries outside U. S.	50,697	57,134	
Cast and wrought, n. e. s.:			
All countries.....	208,889	247,770	
United States.....	1,721	2,798	
Countries outside U. S.	207,168	244,974	
Steel unwrought:			
All countries.....	180,388	90,191	
United States.....	150,169	42,219	
Countries outside U. S.	30,169	47,972	
Old material:			
All countries.....	176,346	82,503	
United States.....	133,125	13,556	
Countries outside U. S.	43,221	68,947	

Taking the whole tonnage, it declined only from 2,325,029 tons to 2,257,013 tons in spite of the fact that the total exports to the United States fell off from 803,674 tons to 381,212 tons. In other words, the great falling off in the shipments to this country has been nearly compensated for by better business in other quarters. The falling off has of course been most marked in pig iron, railroad iron, crude steel and old materials, notably in the case of the latter two. It is evident, therefore, that the English market, so far as exports in-

fluence are concerned, is getting into the shape where they can hold their own even without our buying, and that they would show a rising tendency if we were to become buyers again to any considerable extent. Of that, however, there is little prospect. Prices here are below the importing point, so far as the greater part of our territory is concerned, in nearly all lines in which a large importing trade was done last year. Foreign makers cannot touch Bessemer pig except under special circumstances, and the demand for rails is so light that there is no danger of importing pig, or blooms or rails. In mild steel, for slabs and billets, our own works, at low prices, are still taking practically all the business there is. In old material the situation is a little different. While we are still considerably below the importing point the scarcity, with the winter close upon us, and little renewal work going on, is likely to grow more marked as the season advances, and the coming of foreign old rails in some quantity is not beyond the range of possibilities.

Another point is worthy of notice. With a heavy outward grain movement, which the poor crops abroad make likely, freights to American ports are likely to come down. If they should decline enough, it is possible that steel in some quantity may again be sold for this country.

As matters stand, there is room for a moderate advance here without opening the gates for large quantities of foreign goods. From that quarter we are reasonably safe so long as an upward movement here does not obtain too much impetus. The whole situation does not warrant the expectation of a rapid rise, especially not along the Atlantic seaboard, where the revival in some lines in the Western iron trade has found only a mild echo.

Trusts and Combinations.

There is very great need during the present active discussion of industrial affairs of a far clearer understanding of the meaning and scope of the terms "trust" and "combination." In the speeches of statesmen and economists, in the debates of Congress, in the discussions and comments of the daily press, we meet with the same careless use of the terms. In fact, the point has been reached when every trade association is branded with the name of "trust." This lax use of the term may possibly lead to serious consequences, and it is the duty of those engaged in manufacturing enterprises to vigorously protest.

It is useless to deny that public opinion sees in the modern trust a serious menace to the country. That feeling is now finding expression in tentative efforts to devise some means of providing safeguards by legislative action. Some restrictive measures have been passed, others are contemplated and it is only too easily possible that harsh and sweeping laws may be sanctioned which may prove seriously embarrassing. They are only too likely to strike more heavily those who have not followed the methods complained of. We have repeatedly stated, and we insist again, that the principal characteristic of the modern trust is that those who enter it as manufacturing concerns surrender their identity. As the trusts are organized a manufacturer or a corporation

receive a pro rata quantity of stock, and as managers of their business give over their power absolutely to an autocratic board of trustees. The latter control the purchase of raw material and the sale and the prices of product, decide arbitrarily whether or not particular works shall continue to operate, and fix finally the distribution of profits. The aim is confessedly to remove the very elements in ordinary combinations which have constituted the protection of consumers, and which have caused the public to look leniently upon the associations of manufacturers which have existed in one or another form for centuries and in all countries.

So long as some latitude was allowed to individuals, as in the ordinary combinations, their career, with few exceptions, was short-lived. The greater their abuse of power the quicker, generally speaking, has been their downfall, the longer the period of unbridled competition following it. The result has been that manufacturers have learned to look upon the time of their existence as a period of truce during which to make active preparations for subsequent war. In many instances, too, they have turned out to be nothing more than a special opportunity for those who were least scrupulous in seizing every chance for a breach of good faith. It is an open question with many manufacturers whether in the long run combinations do not do them as much harm as they do good. The majority look upon them as temporary expedients at best to tide over periods of restricted demand.

In a few cases they may do injustice to consumers for a limited time, but, on the whole, they only secure to the manufacturers what every reasonable buyer will concede to them—a fair return on capital invested and for risks taken. The most serious error the managers of combinations can commit is to abuse what power they possess to extort excessive profits, since it surely offers a temptation to outside competition, with all the waste and loss unduly large extensions of producing facilities imply. It is this danger, fully appreciated by manufacturers, which protects the consumer, and has caused him to look upon their formation with some indifference, and certainly without a sense of being menaced.

It is different with that latest phase of industrial development, the modern trust, with its aggregation of enormous capital, wielded by a few men absolutely without responsibility even to their associates in business, crushing competition, extorting special favors from common carriers, and laying under tribute the consumers of a continent. There is a wide difference between such organizations which absolutely stifle competition and the ordinary trade combinations which aim to regulate it. This distinction should be clearly and distinctly recognized. Thoughtful business men have long inclined to the opinion that unbridled competition is far from being a blessing either to the consumer or the producer. If its waste and extravagance can be lessened without prejudice to the consumer the methods adopted deserve the support of the public. With all their faults the ordinary trade combinations tend to that end, and a wholesale condemnation of them as "trusts" would be unjust and full of harm to the best interests of the country.

How little this distinction is understood even in Congress is shown by the "anti-trust bills" lately introduced. Their aim is to punish the alleged offending industries by abolishing or reducing the duties. Among those so treated we find the steel rail manufacturers, whose "trust" was unable to permit a decline from \$40 to \$28.50 in the price in one year. Another "trust" which will more calmly look upon the proposed action is the copper interest, which is to be curbed by abolishing the duty on ore and on ingot. To them the measure will cause little grief, since it is a matter of absolute indifference to the producers of the raw material whether or not there is a duty on metal or not. As the largest contributors to the world's markets, prices have for years been regulated by the latter, and the duty is of as little consequence as the duty on wheat. The only method of meeting the trouble would be to deny the producers the right to sell their product to foreign speculators.

The measures proposed clearly establish the ignorance of industrial affairs on the part of those who have brought them forward. Still, they are a menace to the manufacturing interests of the country, which can be removed only by vigorously insisting that trade combinations are far from being "trusts."

The Western Pig Iron Trade.

The month of August has witnessed an exceptional condition of activity in the Western pig iron trade. It is about the usual time for the manufacturers of agricultural implements to place their orders for material to cover their estimated requirements for the ensuing 12 months, and the manufacturers of malleable iron castings have, to a great extent, the same custom. Other consumers of pig iron, however, purchase according to their current wants, or, within certain limits, are governed by the condition of the pig iron trade, except the car-wheel makers, who buy largely in January. This year a peculiar conjunction of events brought about a widespread buying movement which seemed to culminate in August. Almost all classes of customers were represented among the buyers, from those who mainly use charcoal pig iron down to the seekers for the cheapest grade of coke pig iron. The buying movement in the general trade appears to have been started by the rolling mills and pipe foundries, from whom it rapidly extended to other classes of consumers.

The market for mill pig iron was seriously weakened in June, when the Western millowners began to make preparations for a long stoppage of operations, which they believed would follow an expected disagreement with their workmen over the scale of wages. In anticipation of that event they purchased just enough material to last through June, so as to have no stock on hand when they should shut down. This necessitated heavy purchases of pig iron in the latter part of July, when the controversy over wages was abandoned by the manufacturers. At the same time the large cast-iron pipe works began to absorb enormous stocks of the same grade of pig iron. Other consumers of cheap

iron also laid in stocks, as the price seemed to be as low as could reasonably be expected under existing conditions. The movement then took in a wider range of buyers, who were quick to perceive the growing scarcity of cheap iron, and were ready to place orders for a reasonable time in the future whenever they felt certain that the downward tendency in prices had been checked. Some of the Chicago furnace agents found their August trade in foundry pig iron the heaviest they had ever experienced for this season. Even small foundries have placed orders to cover their entire wants for the remainder of the year.

In the very nature of things this activity could not be expected to continue, and, while here and there will be found a furnace agent in receipt of good orders from a few belated buyers, it is highly probable that a period of comparative dullness may again be seen. The furnaces being in good shape now, with their output sold ahead for a considerable extent, prices can easily be sustained at present figures, unless other furnaces are blown in whose product will have to be forced on the market. The slight advance in price noted in our market reports, on a number of brands of Western pig irons, has usually been confined to those selling under what might be considered the normal rate. Other brands have steadily been held at this rate, and their prices have not been advanced. Contracts for such brands, when not sold up, can still be placed at their old price.

The outlook is therefore by no means in favor of a "boom," unless the railroad companies should enter the market and make liberal purchases of all kinds of material. Many of them need to do so, it is true, but they are restrained by the condition of their balance sheets. Heavy traffic this fall, in consequence of the large crops and the expected early export movement toward the seaboard, may very materially change their financial condition, when they would, of course, alter their policy of the utmost economy in all purchases of material. Whether this will be the case or not requires the gift of prophecy.

The present condition of the Western pig-iron trade is fairly satisfactory to the manufacturers possessing good furnace plants, well located and prudently managed. Although prices are considerably lower than they were a year since, the cost of labor, coke, iron ore and transportation has been reduced also, and the manufacturers in but few localities are complaining of their inability to obtain more than mere cost for their product. Those who complain are usually so situated that they are compelled to seek distant markets in which to dispose of their pig iron, and in which they are obliged to meet the competition of local makers. During the latter part of last year and early in the present year the decline in the price of pig iron was so rapid that the Western makers generally, who had time contracts for coke and iron ore, were unable to reduce cost fast enough to keep the balance on the right side. But this has now been remedied, and even if prices do not advance beyond their present figures, the improved position of the trade conduces to decided cheerfulness among the manufacturers.

Late Developments in Peru.

The distress in general finances and the deadlock in monetary affairs in Peru have become such since the commencement of the year that something has to be done to enable the country to emerge from its crisis of impoverishment. This is all the more to be desired since considerable foreign interests are involved, among them being those of American railroad contractors. Fortunately for all interested, a favorable change is at length at hand, through the revival, in better shape, of the Grace contract on behalf of the Peruvian bondholders. It is hoped that through a joint arrangement the railroads belonging to Americans, now confiscated, will be released.

Negotiations have been going on at Washington between our State Department and Don Cipriano Zegarra, the Peruvian plenipotentiary, about those railroads, since June last. In April, notwithstanding the firm position assumed in the matter by our Legation at Lima, a decree was issued by the Peruvian Government declaring that the contractor for the Southern railways of Peru, those connecting the Pacific with Lake Titicaca, should immediately turn over the administration and plant to the Government officials, and that an investigation of the responsibilities entered upon by Mr. Henry Meiggs, the original constructor, and Mr. T. L. Thorndike, the present contractor, should be made so as to establish the obligations existing. The same had already been done with regard to the Salaverry and Trujillo Railway, under contract to Mr. E. C. Du Bois, a citizen of the United States. The Oroyo Railway is contracted for by Mr. Michael P. Grace, and although similar action was attempted in the Peruvian Congress, it was not successful. All of these contracts were constituted legally, with the approval and sanction of the established Governments. The contractors are creditors of Peru and claim the right to retain possession of the railways as a guarantee for the payment of the sums due them. Should the Grace contract in its new form be accepted by Peru, this would facilitate matters very much, as the question could be satisfactorily arranged between the bondholders and the contractors.

Lord Donoughmore is on his way to Lima accompanied by Mr. Michael P. Grace, brother of the ex-Mayor. Lord Donoughmore is the representative of the English bondholders of Peru; he has the well-earned reputation in England as a man of solid political attainments in the House of Lords, and of excellent business capabilities in the city of London. The capital which the holders of Peruvian bonds have tied up is about £54,000,000, or, in round numbers, about \$250,000,000. Lord Donoughmore and Mr. Grace will work hard to settle the debt on the basis of the Tyler-Grace-Nanibar contract of May, 1887. That contract was not submitted to the last Peruvian Congress because of certain objections raised by the Chilean Government. These objections, the British syndicate have reason to think, are overcome, and the two gentlemen hope to have the contract sanctioned by the Peruvian Congress now in session. By this contract the English bondholders will surrender their bonds and so cancel the

external indebtedness of Peru. The latter in return gives the bondholders her national railways and certain grants of national agricultural lands and certain mines. The bondholders agree to complete the roads and maintain them in perpetuity.

The mining rights are understood to extend over a series of years. The property includes silver, coal and cinnabar mines, the development of which will require ready capital. The syndicate will be allowed to mortgage their property up to £6,000,000, or \$30,000,000. The railways are expected to yield £80,000 a year. The grant of land for colonization is 1,800,000 hectares, or about 70,000 square miles. The syndicate property is to be free from taxation, and whatever may be imported by the agents of the syndicate to carry out the plans of perfecting the railroad system, &c., &c., is to be free from duty. Peru covers an area of 1,049,270 sq. km. and has a population of 3,000,000, including 350,000 wild Indians and 20,000 white foreigners, and besides 50,000 Chinese. The chief cities are Lima, with 101,488 inhabitants; Callao, 33,502; Arequipa, 29,237; Cuzco, 18,370, and Chiclayo, 11,325. The public indebtedness stood, on July 1, 1886, as follows:

Foreign debt.....	\$257,115,940
Home debt.....	27,800,000
Paper money in circulation.....	88,541,000

Total.....\$373,456,940

The paper money has become nearly worthless, but will of course rapidly appreciate again should the settlement with bondholders be carried to a safe issue this time. On this point no serious doubts seem to be entertained. In both mineral and agricultural resources, Peru is inferior to but few, if any, countries of similar size in South America. If, therefore, public confidence and credit can be restored in the manner proposed and new life and enterprise infused, the country may again flourish long ere this century comes to a close.

Mad Mathematics.

The New York *Evening Post* of August 11 contains a letter on "The Crippled Iron Industry," of which we give the essential part.

The writer quotes (we do not know how correctly) from a Southern journal this paragraph:

At a meeting of the American Mining Engineers at Birmingham last week Mr. W. M. Bowron, manager of the South Pittsburg Division of the Tennessee Coal, Iron and Railroad Company, showed by a closely itemized statement, allowing 3 per cent. for repairs and 6 per cent. for interest, that iron could be made in the Birmingham district at \$9.04 per ton.

He then gives the market prices of pig iron at Cincinnati, as follows:

Ohio and Southern strong coke,	
No. 1.....	\$17.50 @ \$18.00
Ohio and Southern strong coke,	
No. 2.....	16.50 @ 17.00
Ohio and Southern strong coke,	
No. 3.....	16.00 @ 16.50
Southern car-wheel iron....	20.00 @ 23.00

and continues the argument thus:

Upon inquiry I learned that the freight from Birmingham to Cincinnati is from \$3 to \$3.50 per ton, carload lots. Now, we will figure a little, and see how badly the iron and steel interests are being "crippled."

Taking the lowest grade (No. 3) at the lowest price, and adding the highest rate of freight, we have a margin of \$3.46 per ton, a neat little 38 per cent. The No. 2 grade, figured the same way, shows a profit of \$3.96 per ton, a fraction

less than 44 per cent., and the No. 1 \$4.96, a small fraction less than 55 per cent. All this, mind you, on outside rates of freight and the lowest prices quoted for the various grades. If the "car-wheel iron" can also be produced for \$9.04 per ton it pays, at \$20, a profit of 82½ per cent. It's a pity we can't all have "infant industries," if this is a sample, and it is usually supposed to be the one needing the most protection.

On this remarkable calculation we make no further comment than to state the following facts:

1. Mr. W. M. Bowron, who read the paper at Birmingham referred to, is not connected with the Tennessee Coal and Iron Company.

2. His paper did not discuss, directly or indirectly, the cost of pig iron in the Birmingham district. It referred exclusively to the Sequachee Valley in Tennessee.

3. The cost named by him, in an estimate avowedly not representing any actual existing works, was not \$9.04, but \$9.66 per ton.

4. The ton referred to was the "short" ton of 2000 pounds, whereas the ton in the market quotations is the "long" ton of 2240 pounds, plus an allowance for "sandage," which, on Southern irons, may bring the market ton to 2300 pounds—2268 being, we believe, a minimum.

The *Post* correspondent has, therefore, based his argument on an erroneous quotation, the wrong rate of freight and the wrong ton. It would seem difficult to introduce any further error; but the concluding allusion to car-wheel iron achieves that feat. On this head, we content ourselves with remarking mildly that car-wheel iron does not pay 82½ per cent., and we will leave this ingenious investigator to find out the reason.

The Use of Private Freight Cars.

Representative Lawlor, of Illinois, has introduced a bill in Congress which is of great importance to iron and steel manufacturers in many parts of the country. It is intended to form an amendment to the Interstate Commerce act, and forbids the use of any other freight cars than those owned by railroad companies themselves. Of course, private cars are used by a vast number of shippers besides iron and steel manufacturers, and all of them are equally interested in this question. It has been found desirable for a variety of reasons for shippers to own their cars whenever they had a large trade in bulky articles at regular points. Among iron and steel manufacturers the custom has grown rapidly within recent years, partly because the largest works have concentrated the purchase of supplies of raw material at certain points, making the use of private cars a possibility, and partly because the railroad companies have frequently been unable to supply their patrons with all the rolling stock needed.

The large steel rail companies of the West, depending largely for their supply of coke on the Connellsville region, have provided themselves with sufficient freight cars to carry their stock to them with the utmost regularity. In times of activity they use such an enormous quantity of coke daily in the manufacture of pig iron that they need almost the entire equipment of a good-sized railroad company kept in constant motion on their account alone. If a freight blockade occurs last-

ing several days or a week the operations of their furnaces are affected, as a sufficient stock of coke is rarely accumulated to tide over such an emergency. If the railroad companies furnished the rolling stock used in hauling coke, freight blockades would be much more frequent than they now are, and facilities would often be so inadequate that manufacturers would be obliged to bank up their blast furnaces, with great inconvenience to other departments of the works and serious loss to the owners.

It has been shown since the Interstate Commerce act has gone into operation how in some lines of business small operators have been practically driven from the field by advantages accruing to large competitors, partly through the use of their own cars. A measure intended for the relief of such shippers should be so framed as to apply to just such cases, and by no means should be made so sweeping as to work injury in other quarters. Establishments of great importance depending upon the regular receipt of supplies of raw materials for their steady operation, and to secure which they have been obliged to provide a large number of their own freight cars, should not be classed with shippers who have acquired the ownership of freight cars for the purpose of securing a commercial advantage over weaker competitors. If Mr. Lawlor's bill should receive favorable consideration and become part of the Interstate Commerce act, much confusion and great inconvenience would be experienced by many iron and steel manufacturers whenever the railroads of the country again become crowded with business.

Some of the largest and finest pieces of casting ever turned out in Reading have just been completed at the Meller Foundry and Machine Works. They are four Corinthian columns, 26 feet high, 26 inches in diameter at the base and 21 inches at the top, each weighing between 6500 and 7000 pounds. They are intended to support the tower of St. Joseph's Catholic Church, now being erected at Martinsburg, W. Va. The capitals for the columns are of zinc and were made in Salem, Ohio.

The Buffalo Forge Company, Buffalo, N. Y., last week secured a contract for furnishing forges, blowers, exhaust fans and ventilating appliance for the School of Mechanical Engineering, Vanderbilt University, Nashville, Tenn., and are at present working on similar orders from the University of Tennessee, Knoxville, Tenn., and Miller Manual Training School, Crozet, Va., and the State Technological School at Atlanta, Ga.

The Pennsylvania Railroad Company have begun suit in New York against the Arthur Kill Bridge Company for \$5,000,000 damages. The bridge is being built by the Staten Island Transit Company and the Baltimore and Ohio Railroad Company. The Pennsylvania Company claim that the bridge is not constructed upon approved plans, and is a hindrance to navigation, many of their boats having been damaged by being swung against the abutments.

In order to exhibit the resources of Utah most effectively the Chamber of Commerce of Salt Lake have fitted up a rail car in a sumptuous manner, and arranged therein a great variety of specimens representing undeveloped wealth. The car was first sent to St. Louis.

CORRESPONDENCE.

Prices on Pipe Fittings.

GALVESTON, TEXAS, August 18, 1888.

To the Editor: In these days, when manufacturers are making and revising price lists of all kinds, it would be well for those interested in the pipe-fitting trade to arrange a uniform price list on fittings. To illustrate the variations in prices, I inclose a table showing the different schedules of prices made on the one line of malleable elbows:

Elbows.	A	B	C	D	E	F	G	H
Inches.	Chicago.	Chicago.	Chicago.	St. Louis.	St. Louis.	St. Louis.	Boston.	New Orleans.
1/2	.04	.04	.04	.04	.04	.04	.05	.05
3/4	.04	.04	.04	.04	.04	.04	.05	.05
1	.05	.05	.05	.05	.05	.05	.07	.07
1 1/4	.06	.06	.06	.06	.06	.06	.09	.09
1 1/2	.10	.09	.09	.09	.09	.09	.15	.15
2	.16	.16	.13	.16	.13	.16	.22	.22
2 1/4	.23	.21	.20	.21	.20	.23	.32	.32
2 1/2	.34	.32	.25	.32	.25	.32	.38	.38
3	.52	.45	.40	.45	.40	.50	.60	.60
3 1/4	.80	.72	.75	.72	.75	.75	1.25	1.25
3 1/2	1.50	1.40	1.10	1.40	1.10	1.40	1.75	1.75
4	2.00	2.00	1.35	2.00	1.35	2.00	2.10	2.10
4 1/2	3.00	2.80	1.80	2.80	1.80	2.80	4.00	4.00

C and E are alike, B and D are alike, G and H are alike.

This is just a sample of the wide variations which run through the whole price list. You will note that there are three different lists used by different houses in Chicago and three in St. Louis. The pound price list is more nearly uniform.

Yours, &c., JNO. W. THOMAS,
Purchasing Agent, Gulf, Colorado and Santa Fé Railway Company.

Influence of Aluminium on Cast Iron.

BRANFORD, CONN., August 27, 1888.

To the Editor: The paper with the above title, which was read at the Cleveland meeting of the American Association for the Advancement of Science and printed in the August 23d edition of *The Iron Age*, must have attracted undue attention, and we have much to thank Messrs. Keep, Mabery and Vorce for in their efforts to substantiate and systematize our fragmentary information. The mechanical part of these experiments was conducted with such evident carefulness, and the results were presented graphically in such an intelligent manner that it is to be regretted that, in the place of dealing with an alloy containing 8.86 per cent. of silicon, they did not conduct their trials using metallic aluminium alone. These remarks are of necessity in the form of a criticism, but are submitted with a view to calling attention to a factor in the problem which seems to have been forgotten, and with the hope that further discussion may bring to light additional information. The ferro aluminium used contained 3.86 per cent. of silicon and 11.42 per cent. of aluminium, and in order to introduce the desired percentage of aluminium into the iron experimented with it was inevitable that a certain amount of silicon would also be added, and this too in quantities, though looking small when reduced to per cents, yet large enough to materially influence the results. The effect of silicon upon cast and malleable cast iron has been with me the study of years, and I know that some of the very effects noted by Messrs. Keep, Mabery and Vorce and credited by them to the influence of aluminium might have been caused by the silicon. The carbon in cast iron containing less than 1.25 per cent. silicon and low in manganese is surprisingly sensitive to the least increase or diminution of the silicon, even two-hundredths of 1 per cent. making, under favorable conditions, an appreciable

difference. Using an alloy containing 11.42 per cent. of aluminium and 8.86 per cent. of silicon for introducing into 30 pounds of metal 0.28 per cent. of aluminium, you would also introduce 0.077 per cent. of silicon, and the addition of the latter element would, in all probability, render it very unsafe to draw conclusions touching the precise effect produced by the aluminium alone. The cast iron may have contained not quite enough silicon to coax or force the combined carbon into a graphitic or semi-graphitic form, and the addition, under these conditions, of 0.077 per cent., or even less, of silicon, would be expected to alter very decidedly all of the mechanical and many of the chemical properties of the iron. Not but what the aluminium will do all and more, than is claimed, but before these claims can be scientifically established it will be necessary to disassociate it from the silicon entirely and then calculate its influence alone. The subject in the article referred to is treated under the following heads:

- "The Solidity of Castings and the Formation of Blow Holes."
- "Does the Aluminium remain in the Iron to exert an Influence when the Iron is Remelted?"
- "The Effect of the Aluminium upon the Grain, or the Changing of the Carbon from the Combined to the Graphitic State."
- "The Taking Away the Tendency to Chill."
- "The Prevention of Sand Scale."
- "The Effect upon Hardness."
- "The Resistance to a Load Gradually Applied, or a Dead Weight."
- "The Resistance to a Load Suddenly Applied, or the Impact."
- "The Elasticity."
- "Permanent Set."
- "The Effect upon the Shrinkage of Iron."
- "The Fluidity of the Melted Metal."

In order to make the point of my criticism more clear, I will follow the order here laid down and remark, first, under the head of "the solidity of castings and the prevention of blow-holes," that it has not yet been my good fortune to see any "Mitis iron"—wrought-iron castings containing a small percentage of aluminium—that was solid and free from blow-holes; but, on the contrary, all the specimens that have come to my notice, and all that I have now before me, are full of blow-holes of the most pronounced type; and the defect has been serious enough—even when the metal was melted in crucibles, and run into baked fire-clay molds, to cause the complete financial failure of at least one concern in this country. But, in the case in hand, it would be natural to expect that the addition of the aluminium silicon alloy would decrease the tendency of blow-holes and porosity, for the action of the silicon alone would be in this direction, as every one knows who has studied the Terre-Noire process or any of the solid steel casting processes in this country.

In the "Mitis iron" an alloy of aluminium, iron and silicon was also used, and the partial prevention of the blow-holes may have been due more to the silicon than anything else.

"The effect of aluminium upon the grain, or the changing of the carbon from the combined to the graphitic state, and 'the taking away the tendency to chill.'" In this connection it would seem to me impossible to ascertain the effect of aluminium when introduced in combination with silicon, for when the carbon is near the balance—that is, near the point where it will readily assume either the graphitic or the combined form—it will manifestly require but a slight change in the proportion of silicon to throw it one way or the other; the silicon being increased, the carbon would tend to separate in the graphitic form, changing the grain and of course decreasing the tendency to chill. The composition of the iron experimented with in this case was as follows: $Si = 0.186\%$; $P = 0.263\%$; $S = 0.3\%$; $Mn = 0.092\%$.

It is stated that the addition of three-fourths of 1 per cent. of aluminium caused the carbon to separate in the graphitic form. Now, in adding enough of the alloy before mentioned to introduce this 1 per cent. of aluminium, it was necessary to introduce 0.254 per cent. of the silicon, and this, added to the 0.186 per cent. silicon that the iron originally contained, makes the total silicon 0.44 per cent.—quite enough under favorable conditions to permit the carbon to assume the graphitic or semi-graphitic form, and quite enough also to account for any decrease in the chilling property. As far as it was tried—up to 4 per cent.—it was found that the iron became softer and grayer as the aluminium was added, and this would naturally follow from the silicon introduced, which, in this case, would have been about 1.35 per cent., making the total silicon in the iron about 1 1/4 per cent. So likewise with the tests for "resistance against dead weight," "impact," "permanent set," "shrinkage" and the "fluidity" of the melted metal, the silicon introduced every time would produce the same effects under right conditions as those noted, so that even if the aluminium acted in a like manner, no such conclusion could be drawn from tests when an alloy containing silicon is used. Possibly the facts are as Messrs. Keep, Mabery and Vorce have stated, and it may be that they have made other trials which have anticipated the direction of my criticism. If such is the case they would place their co-laborers under even heavier obligation to them by publishing such facts, thus making a valuable addition to the world's metallurgical knowledge.

ALFRED E. HAMMER.

The Mission of Mechanical Engineering Schools.

NEW YORK, August 15, 1888.

To the Editor: It is only this day I note Mr. Hawkins's letter in your issue of the 2d inst. Whether I have set up, as Mr. Hawkins maintains, a "man of straw," or whether I have conclusively shown the fallacy of Mr. Hawkins's real argument, as I believe I have done, can be best judged by the unbiased reader, interested, by a perusal of our two addresses in full, not by reading extracts from either. Mr. Hawkins's paper is published complete in the Transactions of the American Society of Mechanical Engineers, 1888 (and probably elsewhere), mine in the *Sterens Indicator* of July 15, 1888, and in *Science*, June 22, 1888.

I think I have clearly shown the reasons why the printing press can legitimately come in for but comparatively little attention in the technical school, and certainly not at the expense of any time or study now devoted to the prime movers, notably the steam engine. This position I have taken not in the "spirit to defend at every point" my *Alma Mater*, nor indeed on account of any special loyalty to technical schools in general, but simply as being my unbiased conviction, derived from careful consideration and study of the subject.

Indeed, I fear Mr. Hawkins is too apt, the moment his views on technical schools are attacked, to conclude and proclaim that it is due to inborn prejudice on the part of the professors of engineering or of the engineers who have enjoyed a technical school training, instead of carefully considering whether his views, and not the party attacking them, may be at fault.

At the same time I realize that Mr. Hawkins has really the friendliest intentions toward the technical schools, and that on these questions of technical training honest differences of opinion may exist among men who have given the matter some attention. As a fact, this was clearly intimated in my address, which was conceived and written in a spirit of fairness. I should have left

Mr. Hawkins's letter unanswered, were it not for his imputation to the contrary, to which I decidedly object.

As it is, the purpose of these lines is merely to ask the unbiased readers interested to read both papers in full before reaching any conclusion, confident that when this is done they will not consider that I have demolished a "man of straw," as Mr. Hawkins is so ready to assert, but rather that I have demolished the erroneous argument advanced by Mr. Hawkins in his paper read before the American Society of Mechanical Engineers, May, 1888. ALFRED R. WOLFF.

A New Method of Making Copper Pipes.

The disastrous explosions of brazed copper steam pipes which occurred on the Elbe and Lahn have directed the attention of engineers to the subject of the strength and reliability of brazed pipes. Mr. W. Parker, chief engineer surveyor to Lloyd's Register, presented, at a recent meeting of the Institution of Naval Architects, a paper, in which not only is given a scientific explanation of the cause of these failures, but a remedy is also pointed out. Mr. Parker, after referring to tests made with a portion of the steam pipe of the Elbe, and citing the experiments made by the Franklin Institute relative to the decrease of strength in copper at high temperatures, comes to the conclusion that even at the temperature of 360° F., corresponding to steam at 150 pounds, the pipe should still have had a factor of safety at 8½; and that the true explanation of the explosion must be sought in a local injury of the material during the brazing operation. He found that the copper becomes perfectly brittle at a temperature only slightly exceeding brazing heat. In this condition the pipe might be accidentally cracked, and although the section of the metal still remaining intact might be sufficient to withstand the cold water test, yet subsequent use with hot steam might develop the crack, and the pipe ultimately gives way at the working pressure. About the various remedies which have been suggested or tried to increase the strength of such pipes, the author gave no opinion; but he brought under the notice of the institution a new process of manufacturing copper pipes, by W. Elmore, which require no strengthening.

We quote from the paper as follows in regard to the details of this process: A mandrel is surrounded by ordinary unrefined Chili bars arranged upon strong supporting frames in a depositing tank of sulphate of copper, and the copper is dissolved or decomposed, as will hereafter be explained, and is deposited in the form of pure copper on the revolving mandrel, leaving the copper in the form of a shell or pipe of any thickness required, fitting closely to the mandrel. When the required thickness has been deposited the pipe and mandrel are exposed to the action of hot air or steam, then the copper expanding more than the iron admits of the mandrel being drawn, leaving the copper in the form of a pipe, without a seam, perfectly round and true both internally and externally, or the pipe may be expanded or made larger by rolling or other mechanical means, and then the mandrel withdrawn. The deposition of copper by electricity is not at all new. It has been in use for years for electrotyping purposes, and for separating copper from its impurities, and particularly for extracting gold and silver. But copper thus refined is wanting in cohesive properties, and without some means of increasing its density, which would give to it at the same time both tenacity and ductility, it would in

such a form be useless for mechanical purposes. The ingenious manner in which this difficulty is overcome by the present process constitutes its most important feature.

A burnisher or planisher, composed of a small square piece of agate, being the hardest and smoothest substance suitable and available, is supported upon proper arms and levers, and the agate is allowed to press lightly upon the surface of the copper on the revolving mandrel. The burnisher is caused to traverse from end to end of the mandrel by means of a leading screw at any required speed. After it has traversed the whole length of the mandrel it is automatically reversed, and commences its journey backward. The speed of the revolving mandrel and the speed of the traversing burnisher is so adjusted or arranged that the whole surface of the copper is acted upon by the burnisher, the result being that every thin film of copper deposited upon the mandrel must be separately acted upon, burnished and compressed into a dense and cohesive sheet of pure copper possessing a great amount of tenacity and ductility, as will be seen from the experiments and tests which I have made. The impurities or dross fall to the bottom of the tank in the form of mud, and when washed, dried and smelted in a crucible the gold, silver, &c., contained therein can be easily separated. In fact, during the operation of refining copper from the rough Chili bars the finished article is automatically produced in the form of a pipe, and all the impurities are extracted and can be collected.

While I was present at the works of Mr. Elmore, the patentee of this process, four pipes were made. The mandrels had been revolving in the baths for about 170 hours, and the copper in this length of time had reached a thickness of 0.198 inch. The pipes were taken off the mandrels in my presence, and the ends of the pipes cut off so as to present a portion of the pipes acted upon by the burnisher. The remaining portion, or rough ends, showed the nodules, or rough copper, not acted upon by the burnisher, and was in a completely brittle condition. It is well known that the structure of ordinary electro-deposited copper is purely crystalline, and easily disrupted under stress. The adjoining faces of the crystals, of which the whole mass is composed, appear under the microscope to be separated from each other, and have very slight cohesive power.

In order to show the effect of the burnisher upon the material, I have had the structure of specimens of pieces of copper magnified under a microscope and then photographed. One photo was taken from an ordinary piece of cast copper. A second was taken from a rolled bar of copper. The difference in these two structures is very perceptible, and plainly shows the effect of work in the shape of rolling. A third shows the structure of a piece of ordinary deposited copper not burnished, and a fourth shows the structure of a piece of copper one-third unburnished and two-thirds burnished. From these photos it can plainly be seen to what extent the crystals are reduced in size, and the cohesive power of the material increased.

To describe more in detail how the decomposition of the unrefined copper is effected, and how the deposit takes place, I may state that the unrefined Chili bars are cast into slabs of the required length of the pipe, and these are arranged longitudinally in a wooden tank in such a manner that the faces of the slabs are approximately at equal distances from, and parallel with, the surface of the cylindrical mandrel, both at its sides and underneath it, leaving the upper side open for the burnisher to travel over. The man-

drel is fitted with a properly insulated spindle, running in insulated bearings, and driven by suitable wheel gearing, &c. The whole of this arrangement is immersed, as before stated, in a bath of sulphate of copper. The mandrel forms what is termed the cathode, and the copper bars the anode, of the electric circuit. The cathode is connected with the negative pole of an ordinary dynamo machine, and the anode with the positive pole. When the dynamo is set in motion, an electric current passes through the solution, and the following chemical changes take place. The sulphate of copper is decomposed, and the sulphuric acid is transmitted to the anode, there to attack and dissolve or combine with a quantity of copper equal to that which has been liberated or deposited upon the cathode.

Mr. Parker gave tables of tests referring to pipes made under Mr. Elmore's process, solid drawn, and brazed from sheet copper, from which it appears that in point of tensile strength and ductility the electro-deposited pipes have a great advantage over the other pipes. In Mr. Elmore's pipes the tensile strength varied from 23.22 to 24 tons, and the contraction of the area of fracture from 71 to 82 per cent. In the solid drawn pipes the corresponding figures were 20 to 20.5 tons and 12.8 to 43.6 per cent., while the brazed tubes only showed 14 tons tensile strength, with from 31 to 45.5 per cent. contraction.

Cost of Pipe Fittings.

In an article on molding pipe fittings in this country, contributed by W. D. Forbes to *Engineering*, the following tables are given of the price paid to the men for making cores and molding:

Price for Cores.

Size.	Elbows. Cents per cwt.	Tees. Cents per cwt.
½.....	\$0.10 @ \$0.13	\$0.10 @ \$0.13
¾.....	.10 @ .13	.10 @ .13
1.....	.10 @ .13	.10 @ .13
1½.....	.09 @ .12	.09 @ .12
2.....	.09 @ .12	.09 @ .12
2½.....	.10 @ .14	.12 @ .16
3.....	.10 @ .14	.12 @ .16
3½.....	.14 @ .16	.14 @ .18
4.....	.15 @ .18	.16 @ .18
4½.....	.25 @ .50	.25 @ .50
5.....	.50 @ 1.25	1.00 @ 1.50
6.....	2.00 @ 2.25	2.00 @ 2.50
7.....	2.00 @ 2.25	2.00 @ 2.50
8.....	2.00 @ 3.00	2.00 @ 3.50
9.....	4.00 @ 6.00	4.00 @ 8.00
10.....	4.00 @ 6.00	4.00 @ 8.00
11.....	6.00 @ 10.00	10.00 @ 16.00

The corresponding per flask for elbows and tees each is given as follows, varying with the different sizes:

Size.	Price per flask each, elbows and tees.	Size.	Price per flask each, elbows and tees.
½.....	2 @ 2½	2½.....	3½ @ 6
¾.....	2 @ 2½	3.....	3 @ 4½
1.....	2 @ 2½	3½.....	3 @ 4½
1½.....	2 @ 2½	4.....	4½ @ 5
2.....	2 @ 2½	4½.....	5 @ 10
2½.....	2 @ 3½	5.....	10 @ 15
3.....	2 @ 3½	6.....	12 @ 20
3½.....	3½ @ 5½	7.....	15 @ 20
4.....	3½ @ 5½	8.....	15 @ 25

The men are required to shovel their own sand and dump their molds.

James Acton Miller and C. G. Barnd, of Fostoria, Ohio, have invented a process and have perfected the appliances in connection with it, for the purpose of utilizing natural gas in the manufacture of iron and steel.

The Perkins Lock Company have been incorporated at Cleveland, Ohio, with a capital stock of \$100,000. Geo. H. Robbins and others are the incorporators.

Samuel Noble.

On Monday, August 13th, one of the foremost ironmasters of the South, and of this country, Mr. Samuel Noble, died, after a brief illness, at Anniston, Ala., of nervous prostration, caused by a severe attack of cholera morbus. The *Anniston Hot Blast* has presented the following sketch of his life:

Samuel Noble was born in Cornwall, England, November 22, 1834, of James and Jenifer Ward Noble. He was the fifth of 12 children, seven boys and five girls, of whom ten are now living, the oldest, a boy, having died in childhood. In 1837 his father removed with his family to America, settling at Pottsville, Pa., from which place he afterward moved to Reading.

In 1855 the family moved to Rome, Ga., where the father established an iron foundry, machinery for which two of the sons, Samuel and William, brought by schooner from Philadelphia to Savannah. Their business in Rome grew and prospered, and their plant was from time to time enlarged. During the war they made cannon for the Confederate Government.

Mr. Samuel Noble spent considerable time exploring the iron regions of Georgia and North Alabama, and acquired a thorough familiarity with their character. During his tours of investigation he frequently visited the locality that is now the site of Anniston, and looked upon it as the most desirable of all the places he had seen for the manufacture of iron. He wanted to build a furnace here, but had not the money. Early in 1872 he accidentally met in Charleston, S. C., Gen. Daniel Tyler, who had been an officer in the Federal army during the war.

Mr. Noble and General Tyler discussed the manufacture of iron in Alabama, and the result was the organization, some months later, of the Woodstock Iron Company and the building of the first Woodstock furnace, which commenced operations in 1873. From that time dates the most active and productive period of Mr. Noble's life. Within the succeeding 15 years he compressed the lifetime work of a dozen men, and accomplished results of stupendous magnitude. The history of his life during that time has often been told in the recital of the history of Anniston. The two cannot be separated. Anniston is the outgrowth of that little settlement planted here in 1873 by the Woodstock Iron Company.

It was an ambition of Mr. Noble that Anniston should be a center of education and refinement, and of moral and religious influences, and all religious and educational enterprises received from him the most liberal support and encouragement. Among other deeds of philanthropy, for which he will be remembered in the years to come, was the building of the Boys' Academy and Noble Institute for Girls, erected at an aggregate cost of \$27,000. The Institute for Girls has been in operation two years, and the Boys' Academy opened its doors last fall. Mr. Noble recently endowed these schools with \$5000 each, the income from which (guaranteed by him to be not less than \$400) is to pay for ten scholarships to be awarded to pupils in the public schools, entitling the holders to two years' tuition.

Mr. Noble was essentially and pre-eminently a self-made man. His early educational opportunities were limited, and he started in life with but a meager common-school education; yet his mind in later years was a storehouse of information on all ordinary subjects of human knowledge.

Mr. Noble was an earnest, persistent and uncompromising advocate of the system of Governmental protection of home industries and home labor by the imposi-

tion of tariff duties on imports of foreign-made goods. He believed that the prosperity of a country depends upon the profitable employment of labor and capital, and he believed that without the aid of protection the American workmen would be reduced to the unhappy condition of the impoverished labor of England.

Mr. Noble came of a long-lived family. His father died last January in his 83d year, and his mother is now living at the age of 83. Until the death of his father there had not been a death in the family for 50 years.

In 1861 Mr. Noble married in Philadelphia Miss Christina Stoekel, who survives him. He leaves four children, Mrs. E. E. G. Roberts, Mr. S. E. Noble and Miss Addie and Josephine Noble. His brothers and sisters are Messrs. John, William, George and James Noble, of Anniston; Mr. Stephen Noble, superintendent of the furnace at Irouton; Mrs. J. Donkle, Mrs. S. T. McMillan, Mrs. H. A. Smith, Miss Elizabeth Noble and Miss Mary Noble, all living at Rome.

The funeral services were held on Wednesday, August 15.

Weights on Locomotive Drivers.

In the course of a recent article on the excessive weights which are now being placed on locomotive driving-wheels, the *National Car and Locomotive Builder* says:

Ten years ago the engineers of many railroads used their influence to prevent more than 10,000 pounds being placed on one wheel, and even with that comparatively light weight the indications were that the locomotive caused the greater portion of the wear to the rails. Mr. O. Chanute investigated this subject very carefully some years ago, and he found that with the light weights then in vogue the pressure of the drivers on the limited point where the tire and rail meet approximated closely to the ultimate crushing resistance of the metal. He concluded that from one-half to three-fourths of the rail wear was due to the pressure of the engine-wheels alone. European engineers experimenting in the same direction reached conclusions substantially the same in regard to the wear of rails on the lines they were connected with. When the wear, under the impact of locomotive drivers, was so great with half the weight now often placed on each wheel, the existing state of affairs is likely soon to demand a remedy. Complaints about the rapid wear of steel rails are already highly pronounced on many roads, and the present tendency is to put the blame upon the manufacturer. The prevalence of cold flow of metal on the surface of the rails, and of numerous crushed rail ends on the divisions where locomotives with excessive weight on the drivers are at work, may soon direct attention in another direction.

The tendency constantly is to place increasing burdens upon the locomotive. The cars are every year built heavier and the locomotive must pull the same number or more and make faster time with the trains. Then the boiler has to supply steam for compressing air to operate brakes and signals, and those in charge of the mechanical departments perceive that their engines must soon be able to provide steam for heating the cars and for driving dynamos to generate electricity for lighting purposes. This being the case, there is strong temptation to design locomotives with boilers so large that the weight on two pairs of drivers is too great for the rails. The question then arises, Why not use three pairs of driving wheels and by that means make a better distribution of the weight? A few roads have tried mogul or ten-wheel engines for passenger service, and we see no reason why the practice should not be widely ex-

tended. Before the strike of their locomotive engineers the mechanical department of the Chicago, Burlington and Quincy were for some time engaged on a series of interesting and valuable tests, undertaken to establish the relative efficiency of different types of locomotives in hauling exceptionally heavy passenger trains over an undulating road at a fairly high rate of speed. The best work in handling the train was done by a new mogul passenger engine built at the company's shops and a 10-wheel engine belonging to the Chicago, Burlington and Northern. The latter engine was taken directly out of freight service without any change, and she handled the heavy passenger train admirably, showing that on the level she could keep a train of 12 heavy coaches running at a speed of over 50 miles an hour. This proved that the engine could make speed sufficient enough for all practical purposes; but the leading point of superiority about the engine was the expeditious way in which she could pull the heavy train into speed from the numerous stopping places. The Michigan Central people have been running a ten-wheel Schenectady engine with so much success that on their fastest heavy through passenger trains that they intend getting more locomotives of the same class for the service that has hitherto been so difficult to operate promptly with eight wheelers. Stop or slow up points will always be numerous on our railroads, and the locomotive that can raise the train most quickly into speed will have a decided advantage over those that are designed merely for maintaining a high speed.

Other companies which have tried mogul and ten-wheel engines for heavy passenger service have met with very encouraging results; yet there is a widespread antipathy to placing a locomotive with more than two pairs of drivers in front of a passenger train. There is want of confidence in the safety of this class of engines for high speed that does not appear to rest on the foundation of experience. Men will say that it is not safe to have the heavy rods required for six coupled engines flying up and down at the velocity required for a fast running train; but no one will give particulars of the breakage of rods belonging to that class of engine caused by fast running, for accidents of the kind are scarcely known. The rods and running gear of a six-coupled locomotive may be a little harder to maintain on fast passenger service than the same parts of an eight-wheel engine, but the difference is not sufficient to count against the former type of engines being employed on the work named. We are satisfied, where it is necessary to use 50-ton locomotives for passenger service, that it will be found more economical to place the adhesive weight on three pairs of driving wheels than on two pairs. If the engine is specially designed for fast running, with large wheels, long steam ports, ample bearings and well-proportioned rods, the cost of maintenance will be no more than in the case of overweighted eight-wheel locomotives.

The Freeman Wire Company are about to begin the remodeling of their wire plant. Among other improvements contemplated at the works is the substitution of a 400 horse-power engine, likely of the Harris-Corliss type, for the engines now working, the same to drive both the wire mill and the barb wire factory. They will reopen their main office in this city within a few days.—*Age of Steel, St. Louis.*

David Round & Son, of Cleveland, Ohio, who operate a chain works at Findlay, Ohio, inform us that they have closed down the works for an indefinite period on account of a lack of orders.

SAMUEL NOBLE.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., August 28, 1888.

Pig Iron.—A firmer feeling has been developed in Pig Iron, and orders for large lots are hard to place. This, however, is due more to the diversion of certain brands to other points than to any improvement in the local demand, although the effect upon prices is the same. Writing from this point, and leaving other correspondents to report their respective markets, it is a matter of regret that we cannot find any material increase in the volume of business in this vicinity. Prices are all firmer, in sympathy with the movements elsewhere, and they will doubtless continue to sympathize with any further movement; but, apart from that, there is nothing in the market to indicate any independent action of its own. There is a scarcity, of course, because a great deal of Iron is being drawn to the West, which, until recently, has been coming this way, while agents of Southern furnaces report that elsewhere they can do nearly \$1 per ton better than in Philadelphia. This leaves consumers dependent upon local furnaces, but for the present they seem able to meet the demand at current rates, and, as a matter of fact, quote precisely the same figures as a week ago, although they discriminate closely in regard to quantity, giving the preference to regular customers. It is now pretty well settled that there is no chance whatever for lower prices this season, and it is by no means certain that an advance of 50¢ @ \$1 per ton may not be realized. All depends upon the continuance of the demand West; if they can maintain their present position, prices here will doubtless work toward a somewhat higher level. Meanwhile, covering both ends of the market, quotations for tidewater deliveries are about as follows: No. 1 Foundry, \$18 @ \$19; No. 2, \$17 @ \$17.50; Gray Forge, \$15.75 @ \$16.50.

Foreign Iron.—There is a disposition to place orders, but the firm tone manifested abroad prevents anything being done at present. Sellers quote \$19.50 @ \$20 for Bessemer, c.i.f., duty paid, but bids are a full dollar below those figures.

Blooms.—A liberal movement is reported in Steel Blooms at figures within the limits quoted below, price according to analysis, &c. Nail Slabs, \$28.50 @ \$29.50; Billets from \$30 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 per "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29 @ \$30 for Nail Slabs; \$31.50 @ \$32.50 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—There is a good deal of activity in this department, and a large business could be done at about \$27.50, delivered. Holders are firm at \$28 (in some cases \$28.50) delivered, but buyers do not respond freely to the advanced ideas of holders, unless from necessity.

Bar Iron.—A slight improvement can be reported in this department. Several of the mills have taken some good-sized Skelp orders, which with other specialties takes them pretty well out of the market for the present. A somewhat heavier demand for Bars is also noticeable, so that manufacturers are inclined to be a little firmer in their prices. There is also less competition from the West, notwithstanding that Ohio Bars have been offered during the week at extremely low figures.

But, taking the market as a whole, there is doubtless a much better feeling, more business, and as a rule a little better prices, but nothing beyond that. The outlook is considered fairly satisfactory, and prices for the Best Refined Bars are steady at 1.85¢ @ 1.9¢, and Grooved Skelp at 1.8¢ @ 1.82½¢. At the same time, Bars said to be of good quality can be had in round lots at from 1.7¢ to 1.8¢, and a good deal of business has been done at these figures, and comparatively little at the higher quotation, but all depends on what the buyer is willing to accept as a guaranteed quality.

Plate and Tank Iron.—The demand for small lots is well maintained, but mills have not accumulated orders to any important extent, so that prices are still about as they were some time ago. The feeling is improving, however, and there is a general impression that a larger volume of business will be forthcoming during the next three or four weeks, although at the moment nothing of importance is on the market. Prices remain about as before, viz.: Ordinary Plate and Tank Iron, 2¢ @ 2.10¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—No great amount of business has been done during the week, but small orders have come in quite freely, so that the mills about hold their own. Notwithstanding the reported activity in Western markets, the outlook in this vicinity fails to develop anything different to what we have reported for some time past. Still, the feeling is hopeful, and if there is no improvement there certainly is no retrogression. Prices about as follows: 2¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—Although there is an absence of large orders there is enough demand in a small way to absorb pretty much the entire output, and stocks in manufacturers' hands are no larger than in ordinary seasons. Prices for good makes are firmly maintained, but in other cases a good deal of irregularity is reported. Small lots are quoted as follows:

Best Refined, Nos. 26, 27 and 28....3¼ @ 3½¢
Best Refined, Nos. 18 to 25....3 @ 3½¢
Common, ¼¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28....4¼ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25....4 @ 4½¢
Best Bloom Sheets, Nos. 16 to 21....3½ @ 3¾¢
Blue Annealed.....2.8 @ 3 ¢
Best Bloom, Galvanized, discount.....62½ %
Common, discount.....67½ %

Merchant Steel.—The general tone of the market continues strong, and, while prices are not quoted higher, there is a firmness that indicates a confident feeling, and a few weeks more of activity, such as the last two have been, will probably go far toward securing some advance in prices. Manufacturers are regaining confidence and, as a rule, anticipate a large fall trade. Prices are quoted as follows for lots from store: Tool Steel, 8½¢; Machinery, 2½¢; Crucible Spring, 4½¢; Open-Hearth Ordinary Spring, 2½¢ @ 2½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—There is very little change to notice in this department. The demand is chiefly for small lots, and these for prompt delivery. Sales have been made for lots of 1000 to 2000 tons each at \$28.50 @ \$29 at mills, and in the absence of a demand for large lots, these are probably firm quotations.

Old Rails.—An active inquiry is reported for Old Rails, but there are none for sale in this market at prices likely to attract attention. Bids of \$21 @ \$21.25

could be had for spot lots or lots to arrive, but there are none on the market at present. Sales in the interior are reported at from \$22.50 to \$24, delivered to mills, price according to location.

Scrap Iron.—A very active demand is reported, and prices are firm, with an advancing tendency. Quotations about as follows: \$18.50 @ \$19.50 for cargo lots; \$20 @ \$21 for carload lots, delivered, or for choice \$21.50 @ \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$19 @ \$20; Cast Scrap, \$14 @ \$15; do. Borings, \$9 @ \$10; Old Fish Plates, \$24 @ \$25. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—There is a continued good demand for Pipe of all sizes. Prices remain firm but unchanged, although there is some talk of a slight advance. Discounts are quoted as follows: Black Butt-Welded, 55 ¢; on Galvanized do., 45 ¢; on Black Lap-Welded, 65 ¢; on Galvanized do., 52½ ¢; on Boiler Tubes, 60 ¢.

Nails.—There is no change to note in the general situation. Prices show no improvement whatever. Standard brands are held at \$1.90 for carload lots, while those of uncertain quality are difficult to market within 10¢ of that figure. There seems to be a lack of confidence, and to do business manufacturers are compelled to quote figures that leave little or no profit in the transaction. Lots from store are quoted at \$2 per keg.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, August 27, 1888.

The feature of the past week has been the advance in Old Iron Rails. They had shown an upward tendency for four weeks, but last week they suddenly jumped from \$21 to \$24, with more sales reported than usual. Other material is firmer in sympathy.

Pig Iron.—Some of the largest sellers of Lake Superior Charcoal are now out of the market, having taken all the orders they cared to book for future delivery at current prices. The others are endeavoring to get an advance from belated buyers, very few of them being willing to take orders at our inside quotations. The demand for Strong Coke Foundry is improving, and outside figures are being more easily obtained as buyers increase and sellers decrease. Mill grades are now relatively dearer than Foundry, both in Northern and Southern Iron, doubtless in sympathy with the advance in Old Rails, which will cause some consumers to use Mill Pig more largely. Prices of Southern Irons are almost up to prohibiting figures, Mill grades having already passed that point. The demand for Iron is now on a very fair basis, consignments being easily placed among the local foundries. We quote for cash as follows: Lake Superior Charcoal, all numbers, \$19.50 @ \$20; Alabama Car-Wheel, \$26.25; Southern Charcoal Foundry, No. 2, \$18 @ \$19; Jackson County Softeners, No. 1, \$18 @ \$18.50; Hocking Valley, Soft Foundry, No. 1, \$17 @ \$18; American Scotch (Blackband) No. 1, \$18.50 @ \$19.50; other Ohio Scotch Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$17 @ \$18; No. 2, \$16 @ \$17; No. 3, \$15 @ \$16; Southern Coke, No. 2, \$17.25 @ \$17.50; No. 2½ and Open Bright, \$16.50; No. 3, \$15 @ \$16.25.

Bar Iron.—The heavy orders of the season have been generally placed by this time, and apart from the regular buyers the car trade is now looked to for an occasional lift. It is expected that car orders will improve very shortly, as the freight business of the railroads is increasing. The receipt of heavy orders and the

advance in raw material are making the manufacturers very stiff in their views, while many of them have really advanced their rates. New business cannot easily be placed below 1.70¢ f.o.b., Chicago half extras, for carload lots of common Iron. Jobbers quote 1.80¢ @ 2¢ from store, according to quantity and quality.

Structural Iron.—Although bridge-work has been less active in the past week, the demand for Beams for buildings has been excellent. This business has largely originated outside of Chicago, the local building trades being somewhat quiet. Angles are quoted from store at 2.40¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams and Channels, 3.80¢. From mill the following quotations are made on carloads: Angles, 2.20¢; Universal Plates, 2.30¢; Tees, 2.45¢; Beams, 3.40¢.

Plates, Tubes, &c.—The Plate mills are very full of orders, some of them declining to quote on new business. Local dealers report no large orders in the market recently, but a very healthy store trade. Prices are very firm. Tubes continue to be sold at the old price in small lots, but the recent advance by the mills has been maintained. Store prices are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 % and 10 % off on 2½-inch and larger and 62½ % off on 2-inch and smaller.

Sheet Iron.—The excitement among the heavy buyers has not subsided, as all of them appear to have found manufacturers able to supply them. Sales of carload lots from mill are therefore much less numerous. For immediate or reasonably early delivery prices are still held at 3¢ @ 3.05¢, f.o.b. Chicago, for No. 27, but those who are willing to wait until late in November and December can shade these prices slightly. Small lots are sold from store by jobbers at 3¢ for No. 24, 3.10¢ for Nos. 25 and 26, and 3.20¢ for No. 27, with a concession to best buyers.

Galvanized Iron.—A good condition of trade is reported by manufacturers' agents, whose warehouses are kept stocked with assorted gauges and sizes with some difficulty. Prices are fairly maintained, but small lots of Juniata are now to be had at 60 % and 10 % off, and Charcoal at 60 %, 10 % and 5 % off.

Merchant Steel.—The large contracts for cheap Steels are now out of the way, but manufacturers requiring higher grades for their use will soon be in the market. The Plow manufacturers are buying quite liberally at the syndicate price. On the usual grades of Merchant Steel the lines are now being drawn very closely to prevent cutting. It is no longer possible for combination orders to be made up partly of such Steel and partly of other and cheaper goods, so as to make a virtual cut on the Steel. Quotations from store are as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Some of the local companies have been able to take enough orders to fill their allotment and will give way to their less fortunate competitors. While business in this line is quite dull at present, the prospects are brightening for next year. Quite a number of railroad officials are regretting their failure to make extensive renewals this summer while rails were cheap. They see the hardening of prices in other Iron and Steel products and look for sympathetic advance in Steel Rails. The manufacturers

of Rails will probably be chary about taking contracts for next year's delivery at current rates. Quotations continue at \$31 @ \$31.50 for small lots, but desirable orders can be placed at lower rates for fall delivery.

Old Rails and Wheels.—Old Iron Rails experienced a decided advance last week, with a heavy demand and a short supply to meet it. Sales were made at \$21, \$22, \$22.25, \$22.50, \$23 and \$23.75. At the close of the week some holders were asking \$24 and even \$25, but buyers seemed disinclined to follow the upward movement further. Some brokers cabled to Europe for prices, and were quoted rates equivalent to \$23, f.o.b. Chicago, but for immediate acceptance only. The condition of the market is very uncertain at this writing, some of those directly interested predicting still higher prices, while others are confident that prices will recede to about \$21 or \$22, and remain there for some time. Old Car-Wheels are rather scarce, but some movement in them is reported, sales having been made at \$18.50 @ \$19.

Scrap.—An improvement is noted in the demand for Forge, but dealers are not disposed to sell much of their stock at present prices, believing that an advance is impending. Mill Iron has been freely called for. Cast is still quiet. Some demand has been experienced for Borings and Turnings, but Steel has been dull. Dealers offer \$13 @ \$14 for Mixed Country Scrap. Selling quotations for carefully selected are as follows, per ton of 2000 lb: No. 1 Forge or Railroad Shop, \$19 @ \$18.50; Track, \$17.50 @ \$18; No. 1 Mill, \$14.50 @ \$15; Light Wrought, \$10; Horseshoes, \$18.50; Axles, \$23.50; Cast Machinery, \$13.50 @ \$14; Stove Plate, \$11; Cast Borings, \$9; Wrought Turnings, \$11; Axle Turnings, \$13; Coil Steel, \$15; Leaf Steel, \$16; Locomotive Tires, \$16.50.

Hardware.—Prices of Heavy Hardware manifest a stiffening tendency, while the demand is also improving. Builders' Hardware, Nuts, Bolts, Washers and other classes of goods are also more active. In Shelf Hardware the improved feeling is of broader scope, taking in houses which had not previously felt the impulse of heavier buying by the retail trade. Surveying the entire field, the demand now seems to be of a general nature, taking in the whole range of staple and seasonable goods.

Nails.—Manufacturers' agents report a smaller demand for Cut Nails, partly because they are asking slightly higher prices and partly because the leading buyers have supplied themselves for the present. The attitude of the principal manufacturers of Cut Nails is shown by the following extract of a letter from a Wheeling company to their selling agents here: "You are aware that Nails have been selling entirely too low for some time past, and that there is now a better feeling in all kinds of Steel and Iron goods with an advance in some kinds. We think there will be an improvement in the price of Cut Nails in a short time, and we are not desirous to enter more orders at present. Make no engagements or contracts without first consulting us by telegraph." Jobbers still quote \$2 for Steel Nails, and \$2.50 for Wire Nails. The quotation for Wire Nails is, however, liable to be suddenly changed, as the manufacturers have notified the jobbers that they have advanced the price of large lots to \$2.55, f.o.b. Chicago.

Barb Wire.—Trade in this line is stagnant. Jobbers quote 3¢ for Painted, and 3.75¢ for Galvanized, in small lots.

Pig Lead.—Transactions have been confined to small lots, for immediate delivery, as the largest buyers covered all

their requirements by heavy purchases during the preceding fortnight. The prevailing price early in the week was 4.30¢, but prices then advanced to 4.50¢, with a possibility of going still higher.

W. S. Kessler & Co., dealers in Manufactured Iron and Steel, 115 Dearborn street, Chicago, have issued a chart showing the cycles in which panics occur, and the years in which good prices may be expected. It is of interest at this time as an upward movement is predicted for three years, beginning in 1888. The cycles are not taken from Benner's Prophecies, but were worked up by an original investigation.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, August 28, 1888.

The general industrial situation is improving; labor in this district is more fully employed just now than it has been at any time this year, and labor complications are much less frequent of late. Occasionally there is a hitch between employers and employees. River navigation has again been resumed, the effect of which will be to improve general business.

Pig Iron.—While the market is strong and prices have further advanced, there was less business reported the past than the preceding week; however, as consumers are pretty well stocked, having bought enough to cover their requirements for from 30 to 90 days to come, it is not strange that there has been a falling off in demand. Furnacemen generally are pretty well sold ahead and there is but little offering. There is an evident disposition in some quarters to boom the market; considerable Iron is held on speculation, and this will be unloaded just as soon as the holders thereof can satisfy themselves that the highest point has been reached. They could sell now at a profit of from \$1 to \$1.50 per ton, but some of them think the market is destined to go still higher, hence they are not yet prepared to unload. Some furnacemen are confident that prices will go still higher but there are others whose judgment is worthy of as much consideration who are not so confident. It is well known that the raw article is much higher relatively than the products, and unless the latter be pushed up the former will have to go back. We quote prices as follows:

Neutral Gray Forge.....	\$14.75 @ \$15.50.	cash
All Ore Mill.....	16.00 @ 16.50.	"
White and Mottled.....	14.00 @ 14.50.	"
No. 1 Foundry.....	17.00 @ 17.50.	"
No. 2 Foundry.....	16.00 @ 16.50.	"
No. 1 Charcoal Foundry.....	23.50 @ 24.00.	"
No. 2 Charcoal Foundry.....	21.50 @ 22.00.	"
Cold Blast Charcoal.....	25.00 @ 26.00.	"
Bessemer Iron.....	17.25 @ 17.50.	"

While some sellers are asking \$18, cash, for Bessemer, there have been no sales reported above \$17.50, cash. No sales of Mill Iron reported above \$15.50, cash, and then only for well-known brands. Foundry Irons continue dull, but an improved demand is looked for later on in the season.

Muck Bar.—There is considerable inquiry and prices have further advanced; we can report sales at \$28 @ \$28.50, cash, showing an advance of from 50¢ to \$1 as compared with the prices of the preceding week.

Manufactured Iron.—There is an increasing demand for nearly all kinds of Merchant Iron, as there always is when the market stiffens up, as is the case at present. The mills are, therefore, pretty well employed, and likely to be until well on toward the close of the year. Prices may be quoted upon a basis of 1.80¢ @ 1.90¢ for Bars, 60 days, 2 % off for cash for first quality Iron.

Nails.—There is no improvement to note in the Nail trade. Our Pittsburgh manufacturers are still holding for cash

rates, and refusing to sell for less, but from the fact that they are getting very few orders it is evident that buyers are able to do better elsewhere. It is reported that makers west of Pittsburgh are selling as low as \$1.80 and even \$1.75. Makers here say that rather than cut under the regular card rates, which afford a very small margin for profit, they will let their factories stand still.

Wrought-Iron Pipe.—This important branch of the Iron business continues in an unsettled and unsatisfactory condition, and there is not much prospect of any substantial improvement soon. While some of the mills are reasonably well employed others are standing idle, and, while prices have stiffened up somewhat in consequence of increased cost of Pipe Iron, they are still irregular and unremunerative. It is difficult to quote prices accurately: Discounts on Black Butt-Welded may be quoted at 55¢ off regular list; on Galvanized do., 47½¢; on Black Lap-Welded, 65¢; on Galvanized do., 52½¢; Boiler Tubes, 65¢ and 5¢ off.

Old Rails.—There is a continued active demand for Old Iron Rails, with light offerings. Since our last report there has been an advance of \$1 @ \$1.50 per ton, and there is no assurance that the highest notch has yet been reached. We can report sales of American Tees at \$23 @ \$23.50. Present prices will almost let foreign Rails come into this market from the seaboard, but it is expected that the latter will also advance. The stock of American is steadily being reduced, and as there are no new ones being made they will soon be a thing of the past.

Billets, &c.—There is a steady demand for Bessemer Steel Billets, and the market may now be quoted steady at \$29, cash, delivered on cars at makers' works, which is an advance of \$1 per ton within the past 60 days. Sales of Rail Crops and Bloom Ends at \$18.50 @ \$18.75. Steel Rails are quoted at \$30, cash, on cars at makers' works.

Merchant Steel.—The demand has improved, as it usually does at this season of the year; prices remain unchanged. Best brands Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery, 5¢; Open-hearth, 2½¢.

Railway Track Supplies.—There is a fair demand for Spikes; no change in prices, 2¢, 30 days, delivered; Splice Bars, \$1.80 @ \$1.90; Track Bolts, \$2.85 with Square and \$2.95 with Hexagon Nuts.

Old Material.—There is a good demand for all kinds of Old Material and prices are firmer. No. 1 Wrought Scrap, \$19 @ \$20 per ton; Wrought Turnings, \$13.50 @ \$14; Car Axles, \$23 @ \$24; Cast Boring, \$11.50 @ \$12, gross; Cast Scrap, \$14.50 @ \$15; Old Car-Wheels, \$19 @ \$20.

Detroit.

WILLIAM F. JARVIS & Co., under date of August 27, report as follows: The strength of the Pig Iron market and the marked advances which have taken place on nearly all grades is an established fact at the present time, although no changes of note have occurred within the past week. Some considerable lots of Lake Superior Charcoal Iron have been placed at full figures. Many of the buyers who postpone their buying until September ordinarily, have been brought to purchasing a few weeks earlier this year owing to the condition of affairs and the strength which the market exhibited. The car works both here and elsewhere seem to have taken a number of new contracts, judging by the inquiries which have been made and orders for Iron which have been placed by them. Old Wheels are strong, but quotations must be nominal except

for small lots, holders declining to part with them, considering their investment in them good for better figures in the very near future. We know of some speculative lots which have been sought for of Lake Superior Charcoal Iron, which heretofore has been a forerunner of better times. We hope the speculators will not forecast the future in error at present. The Mahoning and Shenango valleys producers are very firm at from 50¢ to \$1 per ton higher than the lowest prices of this year. Large amounts of Ore are being moved, causing strong lake freights, but no great advance up to the present time. With a firm market, we make quotations as follows:

Lake Superior Charcoal, all numbers	\$20.00 @ \$20.50
Lake Superior Coke, all ore	19.25 @ 19.75
Lake Superior Coke, cinder mixed	18.00 @ 18.50
Standard Ohio Black Band	19.25 @ 19.75
Southern No. 2	17.75 @ 18.25
Southern Gray Forge	15.75 @ 16.25
Southern Silvery	17.00 @ 17.50
Jackson County (Ohio) Silvery	18.50 @ 19.00
Old Wheels	19.25 @ 20.00

Cleveland.

CLEVELAND, August 27, 1888.

Iron Ore.—Sales of Champion and Republic Ore at \$6 have occurred during the week. Inquiries are almost exclusively confined to high-grade Bessemer Ores, and several instances of such demands having been refused are reported. Particularly is this the case with the better grades of Gogebic Ores, nearly all of the most valuable mines having sold their contemplated output. Fearing additional advances in lake freights, a local dealer is reported to have sold 18,000 tons of non-Bessemer Ore at a price equivalent to \$3.75, f.o.b. cars Cleveland, during the past ten days. Escanaba charters are reported to-day at \$1.10, while the Ashland rate has advanced to \$1.35. The lake and all rail shipments of Ore this season slightly exceed 2,425,000 tons, as against 2,675,000 tons shipped up to a corresponding period in 1887.

Pig Iron.—There has been a square advance of \$1 in the price of Mill Iron, \$15 per ton, cash, having been paid during the past week for a round lot at the valley furnaces. Bessemer Irons are also stronger and are held at \$17.25, cash, at the furnace. Standard foundry Irons are so well sold up that offers have been declined. Stocks are gradually decreasing and prices are growing correspondingly firmer. Most of the furnaces have orders enough on hand to keep them engaged for several months, and are indifferent regarding further sales except at an advance of from 50¢ to \$1 per ton.

Scrap Iron.—A sale of old Americans at \$22.25—an advance of nearly \$2 per ton over last week's quotations—is reported. There is a good demand for Old Wheels, but sellers are asking prices, considered by purchasers to be out of the question.

Manufactured Iron.—Bar Iron has sold at the mill during the past seven days at \$1.70, and inquiries are numerous. Sheet iron, all numbers, is firmer, No. 27 bringing \$3 readily.

Louisville.

LOUISVILLE, KY., August 27, 1888.

The market continues quiet, no large orders having been placed, but buyers of small lots are in the market, and the aggregate sales amount to a fair week's business. There has been no advance in prices, but the market is fairly holding its own. Furnaces are a little more disposed to meet the demands of their customers for long deliveries, and most of the Southern foundrymen will book orders to run through the next 12 months. It was ex-

pected that Chicago and St. Louis would force the market a notch higher during the past week, but advices from both of these points state business is quiet, so the expected advance has not been realized.

Southern Coke, No. 1 Foundry	\$16.75 @ \$17.75
" No. 2	15.75 @ 16.25
" No. 2½	15.25 @ 15.75
Hanging Rock Coke, No. 1 Foundry	17.25 @ 17.75
Hanging Rock Charcoal, No. 1 Foundry	21.00 @ 22.25
Southern Charcoal, No. 1 Foundry	18.00 @ 18.50
Silver Gray, different grades	14.25 @ 15.00
Southern Coke, No. 1 Mill, Neutral	14.00 @ 14.50
" No. 2	13.50 @ 14.00
" No. 1 " Cold Short	13.50 @ 14.00
Charcoal, No. 1 Mill	14.25 @ 15.50
White and Mottled, different grades	12.75 @ 13.25
Southern Car-Wheel, standard brands	23.25 @ 25.25
Southern Car-Wheel, other brands	19.25 @ 21.25
Hanging Rock, Cold Blast	19.25 @ 20.25
Hanging Rock, Warm Blast	19.25 @ 20.25

Old Wheels are in active demand, and their scarcity has caused an advance in price of \$1 a ton during the last week. They are now held at \$19.50.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, August 27, 1888.

Business men cannot fail to observe the improvement in commercial circles arising from the favorable crop returns that continue to come in from all parts of the South. At this writing it is, of course, impossible to gain a definite comparison of the result of the present year with years gone by, but, from the present outlook, the total yields will exceed those of any previous years. The wholesale merchants located on the trade centers are already buying largely of well-assorted stocks in anticipation of large sales to the interior towns, which the present outlook would seem fully to justify.

Pig Iron.—The past week has developed nothing particularly new nor interesting, but the general statement is about the same as it was two to three weeks ago. While there has been no advance beyond prices that prevailed in the early part of the month, yet there is a very firm feeling as to prices. The furnaces are nearly all sold ahead sufficient to make them quite independent whenever an offer is made that is less than the present market figure. The capacity of the stacks and the demand, so far as can be observed, are now very evenly balanced, excepting perhaps with those stacks whose output has obtained a celebrity, who could, without effort, make contracts several months ahead for their entire product at present prices if they were so disposed, but there is much less of this being done now than two or three years ago. The Southern Steamship Association have issued a circular stating that there will be no rate sheet issued for September 1, reaffirming, so far as they are concerned, the rates of August 1, which are on a basis of \$3 to St. Louis and \$2.25 to Louisville and Cincinnati.

Cincinnati.

CINCINNATI, August 27, 1888.

Pig Iron.—The volume of business in the local Pig Iron market during the past week has not been large, but no difficulty has been experienced by producers in disposing of all the Iron offered; in fact, the outlook has been very encouraging to sellers, and the sales made have been very satisfactory. Full prices have been realized, and in not a few instances higher prices have been secured. As a rule, the furnaces are heavily oversold for a month or so at least, and contracts embracing 15,000 tons Foundry Iron have been refused during the past few days. The supply of desirable Mill grades has been light, but apparently less scarce than Foundry Iron at present. In many instances standard

and desired grades not being available and buyers urgent, various other makes have been disposed of. This leveling up process has a tendency to further strengthen the general market. There is some difference of opinion among sellers as to the exact level of the market. This is no manufacture but is of more prominence now than for some time. No. 1 Mill Iron has been sold at \$14.75 @ \$15, 1000 tons selling at the outside rate, shipment cash. No. 2 Mill is nominally quotable at \$14.25 @ \$14.50; No. 1 Southern Coke Foundry Iron has been sold at \$16.25 @ \$16.50, but some holders demand \$16.75, and have sold lower grades in moderate amounts, estimated on this basis. The crops already secured, and those in prospect are larger and better than any harvested in this section for several years. With this fact as a foundation, confidence is growing fast among sanguine business men. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$17.00 @	\$18.00
Southern Coke, No. 2.....	16.00 @	17.00
Southern Coke, No. 3.....	15.00 @	15.50
Ohio Soft Stone Coal, No. 1.....	17.00 @	17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @	16.00
Mahoning and Shenango Valley ..	17.00 @	18.00
Hanging Rock Charcoal, No. 1....	20.50 @	22.50
Hanging Rock Charcoal, No. 2....	19.50 @	21.50
Tennessee and Alabama Charcoal,		
No. 1.....	18.00 @	19.00
Tennessee and Alabama Charcoal,		
No. 2.....	17.00 @	18.00

Forge.

Strong Neutral Coke.....	14.25 @	14.50
Mottled Neutral Coke.....	13.00 @	13.50
No. 1 Mill Coke.....	14.75 @	15.00
No. 2 Mill Coke.....	14.25 @	14.50

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @	23.00
Hanging Rock, Cold Blast.....	22.00 @	25.00
Lake Superior Car-Wheel and Mal-		
leable.....	20.50 @	21.50

Manufactured Iron.—There has been a fair volume of business, and a stronger and more confident feeling has prevailed without quotable change in prices. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3¼¢ @ 4¼¢ p lb.

Nails.—There has been a fair jobbing demand and a steady market, but supplies are fully ample. Jobbing prices are based upon 12d @ 40d, which sell at \$2 p keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2 and Steel Wire Nails at \$2.65 @ \$2.75 p keg.

Old Material.—All the Old Rails offered in this vicinity have sold readily, and a further advance obtains. There is an active inquiry at the close. Moderate amounts have sold at \$21.50 @ \$22.50 p ton. Old Wheels, too, have met a better demand, but few have been obtainable, and prices are nominal at \$20 p ton, spot cash.

New York.

Office of *The Iron Age*, 66 and 68 Duane street. (New York, August 29, 1888.)

American Pig.—The market continues moderately active, with reports of sales of round blocks for delivery over a series of months and a fair volume of inquiry. The opinion has become general among buyers that it is safe to make purchases for delivery during the balance of the year, but, on the other hand, very few sellers claim that there is any chance for any notable advance. The movement in the West during the past month has relieved a great deal of the pressure put on Eastern markets by eager sellers from the South, the Mahoning and Shenango Valleys, and as they are reported to be supplied with orders, in some cases up to the end of the year, a steady market is looked forward to here. We quote standard Northern Irons, \$18 @ \$18.50 for No. 1 Foundry; \$16.75 @ \$17.50 for No. 2 Foundry, and \$15.75 @ 16.50

for Gray Forge. Freights on Pig Iron from Southern furnaces to Boston have been advanced to \$4.11, net.

Spiegeleisen and Ferromanganese.—Spiegeleisen has advanced abroad from 71/ to 73/ for German, yet lots afloat and August shipments are being offered at \$25.75 for German 20 % and \$26.75 for English, with seller's option of brands. In Ferromanganese there has been an advance of 5/ abroad, due to scarcity and higher prices of Ore, and importers are asking \$50.50 @ \$51.50 for 80 %.

Steel Rails.—The market continues dull and irregular, only one transaction of 5000 tons for a coal road being reported, and one 1200 ton lot for Florida. In the East very little business is coming up. A good deal of inquiry is in hand for the South, but the great bulk of it is not in such shape that the mills care to touch it. Long time, with bonds as collateral for individual notes of contractors, merchants and promoters are generally the terms offered, the propositions at times bordering on the ludicrous. It is possible that a tide of prosperity may carry such schemes nearer consummation, but for the present they afford little relief to the rail mills. We continue to quote \$28.50 @ \$29 at Eastern mill for standard sections.

Wire Rods.—Importations this year are very much smaller than they have been for a long period, American competition on the one hand and the position of the German syndicate on the other having caused the decline. It is estimated that this year the importations of foreign Fence Rods will not be larger than 75,000 to 80,000 tons. In former years the inland German works had the advantage, because our 45 % duty is assessed on the price of the Rods at works. When two German mills one near the shipping port and the other distant from it quoted the same, f.o.b. price, the latter had the advantage. The German syndicate determined to equalize this and adopted a complicated system. From the circular issued in the spring of the current year, when the standard price was 109 marks, we quote:

The following example will explain the calculation of the respective "net at works" price for the different works belonging to the Verein Deutscher Draht-Walzwerke for arriving at the equivalent values f.o.b. Antwerp, including U. S. duty:

Remarks.

Y means the f.o.b. price for Phoenix (Standard). Z means the respective "net at works" price. n means the f.o.b. freight from works to Antwerp.

4 marks means the f.o.b. freight from Phoenix-Ruhrort to Antwerp.

Starting from this basis, the following formula is arrived at:

$$Z = \frac{y - n + 0.45 \times (y - 4)}{1.45}$$

Taking the present Standard f.o.b. price for Phoenix—viz. 109 marks.....	109.00
Adding U. S. Duty, 45 % on 109 marks less 4 marks freight, or on 105 marks.....	47.25
The f.o.b. Antwerp price, including U. S. duty per 1000 Ko., amounts to.....	156.25

The following examples will illustrate the calculation of "net at works price" for Phoenix and other works belonging to the Verein Deutscher Draht-Walzwerke—i. e., Haspe and Schalke:

Phoenix-Ruhrort.	Marks.
Present Standard price f.o.b. Antwerp.....	109.00
Freight Phoenix to f.o.b. Antwerp.....	4.00
Price net at works.....	105.00
Add actual freight to f.o.b.	4.00
U. S. duty 45 % on 105 marks.....	47.25
Total.....	156.25

Krueger-Haspe.	Marks.
Present Standard price f.o.b. Antwerp.....	109.00
Freight Haspe to f.o.b. Antwerp.....	7.80

$$Z = \frac{109 - 7.80 + 0.45 \times (109 - 4)}{1.45} = 102.38$$

Price net at works.....	102.38
Add actual freight to f.o.b.	7.80
U. S. duty 45 % on 102.38 marks.....	46.07

Total.....	156.25
-------------------	---------------

Boecker-Schalke.	Marks.
Present Standard price f.o.b. Antwerp.....	109.00
Freight Schalke to f.o.b. Antwerp.....	5.00

$$Z = \frac{109 - 5.00 + 0.45 \times (109 - 4)}{1.45} = 103.99$$

Price net at works.....	103.99
Add actual freight to f.o.b.	5.90
U. S. duty 45 % on 103.99 marks.....	46.86

Total..... 156.25

This wonderful system, devised to equalize the price at Antwerp, duty added, is a source of much annoyance to buyers of German Rods. The standard price is now 103 marks, at Antwerp. During the week the sales of Foreign Rods have been light, prices remaining weak at \$39.50 @ \$40, ex-ship.

Old Rails.—Under liberal inquiries and short supplies the market has advanced, though too rapidly to allow of much business being done. The only sales reported are one lot of 500 tons a shade under \$23 at Buffalo, a lot of 1000 tons at a shade under \$24 at Youngstown, and 500 tons also for Western delivery at about \$22 on the line of a road in this State. During the past few days \$22 has been bid in vain for Tees, and \$23 for Double Heads. Our market is still considerably below the foreign quotations, held stiff by the fact that Genoa is paying 70/, c.i.f., for Old Rails. The majority of the New England mills are holding at \$24 and \$25, and the bulk of the foreign stock controlled here is held at \$24 for Doubles.

Swedish Iron.—The market is quiet with quotations \$53 for Rough Bars \$56 for Rods, and \$60, ex-ships for Store specifications.

Track Material.—Spikes are active and stiff at \$2.10 and Angles firm at 1.90¢.

Metal Market.

Copper.—The shorts in London seem to have deemed it advisable to cover, and the market there as a consequence has once more taken a decisively upward turn. Opening on Thursday of last week at £83. 7/8, spot Chili Bars advanced all the way to £86 yesterday, while futures remained steady at £79 and good merchantable brands rose from £74. 5/ to £76; sales aggregated 1820 tons. Here a similar movement took place on a moderate scale for similar reasons, some 125,000 lb August being sold at 16.95¢ @ 17¢, while the later months also ruled higher; 16.80¢ @ 16.90¢ was the quotation for September, 16.50¢ @ 16.80¢, nominally, for the winter. This morning a fresh advance in spot Chili Bars is cabled from London from £86 to £88. 15/, futures at the same time giving way from £79 to £78. 15/, but good brands improving from £76 to £78. 5/, and Best Selected for the week from £76. 10/ to £79. Copper closes firm to-day at 16.90¢ @ 17¢ spot, 25,000 tons August selling at 16.90¢ on the first call. The following dispatch was received from Boston August 24 and 27: "The Boston and Montana mine produced 536,286 lb of Refined Copper the second week in August, against 371,560 lb the first week, and this is the largest week's output yet made. The net profit is about 5¢ p lb, or fully \$25,000 for this one week's work. The Boston and Montana directors will call a special meeting of stockholders to authorize an issue of 50,000 shares of new stock, 10,000 shares to remain in the treasury and 40,000 shares to be given to stockholders at par—\$25. The net profit of the Kearsarge mine for August is over \$6000, and work only began August 15." Rio Tinto shares gave way 17 francs last week at Paris. As per Messrs. James Lewis Son's Liverpool semi-monthly report of August 16, the import of American Copper into Liverpool and Swansea from January 1 to date had been 17,139 tons, Fine, as compared with 6856 tons during the corresponding period of last year.

Tin.—Both in London and here the market has been tame and featureless dur-

ing the week, with the tendency downward. London opened on last Thursday at £92. 10/ spot, closing yesterday at £92. 2/6, while three months gave way from £93 to £92. 15/, sales altogether not exceeding 810 tons. Here very little transpired either in a jobbing or speculative way, the quotations ranging as follows: Spot, 20½¢ @ 21½¢, and October, 20½¢. The market in London this morning shows no further change. The closing spot figure to-day in this market is nominally 21½¢, at which the market remains apathetic.

Tin Plates.—There is a fair demand springing up for all kinds of Tin Plates, but, so far as Coke Tins are concerned, it cannot be met, owing to an entire absence of stock. In some cases two grades of Charcoal have been substituted. This demand comes almost exclusively from the fruit canners, the oil canners being sufficiently provided with their special size. Futures can be had at a considerable concession on spot rates, which stimulates activity therein all the more. A thing which rarely occurs is to be noted at the present time—viz., that consumption is evidently ahead of production, but this may soon be met by the starting of new works. We quote toward the close, large lines, 3/ box, on the spot: Siemens-Martin Steel, charcoal finish, \$4.85 @ \$5.25; Coke finish, \$4.75; Ternese, \$4.30 @ \$4.40; Bessemer Cokes, \$4.50 @ \$4.60, and Wasters \$4.20 @ \$4.25; Liverpool is 13/6 with Coke Tin.

Lead.—The chief operator has again been actively at work, buying spot and futures right and left, and causing the open market to advance from 4.30¢ on the spot on Wednesday of last week to 4.80¢ last night, some 1400 tons changing hands, and the latter figure being firmly held at the close. While this was the case in the open market, activity was quite as great on 'Change. Consumers meanwhile remained passive lookers on, not buying anything to speak of. Some 1600 tons of Lead were sold on the Metal Exchange, the interest centering on deliveries up to the end of October, at rising prices, carrying the latter from 4.45¢ August to 4.87½¢ September, October to 4.85¢ and November to 4.65¢. In London Soft Spanish has remained steady during the week at £13. 2/6, while English Pig rose from £13. 5/ to £13. 7/6. St. Louis is firm at 4.60¢.

Spelter.—The situation out West has lost nothing of its strength during the week. Here but little has transpired, Common Domestic not being obtainable for less than 5¢. In London Silesian advanced from £17. 5/ to £17. 10/, and has now to be quoted 5.55¢ nominally here.

Antimony.—Hallett has recovered in London from £38 to £39. Here only a moderate jobbing trade has been transacting at 9½¢ Hallett and 13½¢ Cookson.

New York Metal Exchange.

The following sales are reported:

THURSDAY, August 23.	
116 tons Lead, August.....	4.40¢
32 tons Lead, August.....	4.45¢
FRIDAY, August 24.	
25,000 lb Copper, January.....	16.50¢
100 tons Lead, August.....	4.64¢
SATURDAY, August 25.	
30 tons Tin, August.....	21.00¢
MONDAY, August 26.	
100 tons Lead, September.....	4.65¢
100 tons Lead, spot.....	4.70¢
48 tons Lead, September.....	4.72½¢
48 tons Lead, September.....	4.70¢
25,000 lb Balto. Copper, August.....	15.45
100 tons Lead, August.....	4.75¢
100 tons Lead, September.....	4.75¢
18 tons Lead, September.....	4.80¢
32 tons Lead, September.....	4.77½¢
32 tons Lead, October.....	4.77½¢
96 tons Lead, November.....	4.66¢
TUESDAY, August 28.	
50 tons Lead, October.....	4.80¢
25,000 lb Copper, August.....	16.95¢
100,000 lb Copper, August.....	17.00¢
100 tons Lead, October.....	4.80¢
10 tons Tin, October.....	20.50¢

116 tons Lead, October.....	4.80¢
100 tons Lead, October.....	4.65¢
50 tons Lead, October.....	4.80¢
100 tons Lead, September.....	4.80¢

Financial.

The sensations of the week were extraordinary speculative transactions in wheat, which on a single day made an aggregate of nearly 35,000,000 bushels, and President Cleveland's message relating to trade with Canada and calling for an enforcement of the Retaliation act of March, 1887. The latter, although of deep interest to politicians, was not seriously regarded in business circles. Encouraged by the excellent outlook for crops, good progress has been made in opening the fall trade, and it is observed that despite the conservatism ruling in all departments—as shown by cautious buying—the general trade of the country in July and August compares well in volume with that of former years. Among dry goods jobbers in New York the market has been full of buyers from all sections of the country, with the result of increased shipments and a hardening tendency in prices. Sales are believed to differ little in amount from those of last year for a corresponding date. Wheat advanced 5½¢, but has fluctuated on conflicting reports. Corn and oats also advanced a fraction, despite favorable accounts from the West. Cotton has been lower, but spots advanced ½¢ on Monday. Coffee, sugar, and other leading staples, are firm.

The Stock Exchange markets were dull and irregular until Monday, when they became active and higher, influenced principally by higher prices in London. The most active were Reading, St. Paul, Lackawanna and Western Union. Lackawanna scored the best figures for two years. All the leaders were strengthened by the advance in the prices of Coal announced on Friday. The only perceptible effect of the President's message was a decline of about 1 % in Canada Southern and Michigan Central. In London the cables showed that there was some uneasiness, but, after an interval, selling orders were withdrawn. United States bonds are quoted as follows:

U. S. 4½s, 1891, registered.....	106½¢
U. S. 4½s, 1891, coupon.....	107½¢
U. S. 4s, 1907, registered.....	123½¢
U. S. 4s, 1907, coupon.....	123½¢
U. S. currency 6s.....	120

The Washington crop bulletin for the past week states that the weather has been especially favorable for harvesting in the Northwest. The wheat harvest progressed rapidly in the central and northern portions of Dakota and Minnesota, from which region the reports indicate that the damage to the wheat crop from the frosts of last week was largely overestimated. In the northern portion of the corn belt the weather was favorable, but the growth of the plant was retarded by the low temperature. The St. Paul *Pioneer Press* summarizes the crop situation by saying that the wheat yield in Minnesota and Dakota will be fully as large as was expected. Reports from nearly all parts are favorable to a large yield of oats. The Cincinnati *Price Current* says that "outside of some districts in Southern and Western Kansas there is continuance of an almost uniformly good promise for corn. The latest sales comprise 96,000 bushels at \$1.03½ for Manitoba spring; \$1.07 @ \$1.08 for No. 1, hard, afloat, spot and to arrive, and \$1 for No. 2 red, in elevator. Cash corn is quoted 53½¢ for No. 2 mixed, afloat, and 58¢ for No. 2 white, delivered in September. Provisions are stronger.

The cotton crop of Texas is now estimated at 1,500,000 bales, and with favorable weather may extend to 1,900,000 bales. Last year it amounted to 1,400,000 bales.

The weekly statement of the associated banks showed a further decrease in sur-

plus reserve, equal to \$732,825, reducing the excess to \$21,003,425, but this item is still maintained far above the records of the last two years. The banks were somewhat depleted of funds by the demand from the interior, but much below expectations, which is attributed partly to dullness in the pork-packing trade, but bankers look for a more urgent demand for money at an early day. In loans there was a further expansion of \$839,900. Deposits decreased \$3,499,900, and circulation increased \$55,800. Rates for money are practically unchanged. Commercial paper is fairly active. In the West the demand for funds is variable, according to locality.

Harvey Fisk & Sons, heavy dealers in Government Bonds, have issued a circular, calling attention to the "great peril" arising from the Treasury surplus. Since the Secretary of the Treasury commenced to purchase with surplus money in April last, he has, by official statements from the Department at Washington, purchased, up to August 21, \$38,601,150 4s and 4½s, on which he has made a saving to the people in future interest payments of upward of \$12,000,000. The circular argues that the existing surplus should be expended in the same way, thereby effecting a saving of \$40,000,000 more in future interest payments, and he expresses the opinion that the bonds could be bought at prices which would effect this saving.

The Gansevoort Bank was organized with \$200,000 capital and will locate near the new market. The president is Timothy C. Kimball, and Charles E. Bigelow, of the Blake & Knowles Steam Pump Company, is vice-president. A bank for the hat and clothing trade is being organized with a capital of \$250,000, and Jos. W. Conron, of the firm of E. V. Connett & Co., is spoken of for the presidency.

Sterling exchange is inactive and barely steady. The London *Economist* speaks of the continued demand for gold for South America and the large stocks of metal held by the banks of France and Germany, but as the latter will hardly care to part with much gold the Bank of England will be compelled to advance its rate again if withdrawals are made.

As the month of July began the new fiscal year the course of our foreign trade, as shown by the statistics from Washington in a comparison with former seasons, is watched with eager interest. The statement now at hand shows that the exports for the month, including the large shipments of specie, have not fallen much below the corresponding figures of last year, which was not a promising season, but the imports have gained \$2,500,000, thus increasing the balance of trade against this country. Taking the merchandise alone, excluding the precious metals, we find that the exports were only \$45,267,938, against \$49,395,912 for July of last year, and the imports were \$61,329,461, against \$56,593,226, leaving a balance of trade against this country, exclusive of specie, of \$16,061,523 for the last month, against only \$7,197,314 for July of the preceding year. In July of last year we gained over \$2,000,000 in specie; but in July of this year we lost \$3,500,000 in gold and silver. For the seven months in 1888 we have an excess of imports amounting to \$55,500,000, while for the first seven months of 1886 we had \$37,500,000 excess of exports, making a change in the comparative balance of trade of \$93,000,000.

Coal Market.

The Anthracite Coal trade continues active at firm prices, and the volume of trade is almost without precedent, but the producers seem to have slackened a little dur-

ing the past week, the total output having dropped to 832,058 tons, a decrease of 89,000 tons compared with the previous week, but still far above the usual average. Compared with the corresponding week last year there is an increase of 104,000 tons. Since January 1 the aggregate is 23,092,621 tons, an increase of about 1,000,000 tons compared with the same time in 1887. For four weeks the comparison is as follows:

	Tons.
Week ended August 4.....	754,883
Week ended August 11.....	831,615
Week ended August 18.....	920,922
Week ended August 25.....	852,058

In accordance with the action taken by the sales agents last Friday, as foreshadowed in these columns a week ago, the September price for Free-burning Anthracite at the mines will be as follows: Broken and Egg, \$2.65; Stove and Small Stove, \$2.90, and Chestnut, \$2.65 @ \$2.75. Pea Coal was left unchanged at \$1.25, and Furnace Lump at \$2.25. These new prices are 10¢ per ton higher for Broken and 15¢ for Egg, Stove, Small Stove and Chestnut sizes than the figures which have been ruling for several months past. Including tolls, this is equivalent to about 25¢ advance per ton all round.

September prices are as follows:

Hard, Broken.....	\$4.20
" Egg.....	4.40
" Stove.....	4.65
" Chestnut.....	4.55
Free-Burning, Broken.....	3.95
" Egg.....	4.30
" Stove.....	4.65
" Chestnut.....	4.55

Pea has sold as low as \$2; ruling price, \$2.25 @ \$2.35.

The several companies are said to have no lack of orders, but complaint is general of delay in shipments.

The Bituminous trade steadily increases in volume and prices are reported pretty firm on the better grades. The pool prices remain \$3.25 f.o.b.

The Reading output for the work ending August 25, was 205,000 ton, of which 12,000 were sent to Elizabethport. The Pennsylvania carried for the week ending August 18 219,680 tons of coal, and the increase since January 1 is 807,000 tons compared with last year.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]
LONDON, WEDNESDAY, August 29, 1888.

Events in the Copper market the past week strongly suggest that the syndicate has virtually succeeded in gaining complete control. English smelters who, apparently, have been left to shift for themselves experience an increased demand for their product, and Best Selected has advanced about £2 in consequence. The recently introduced G.M.B. contracts seem to be as closely controlled as are Chili Bars, and the "outside" supplies, by all accounts, are virtually exhausted. This condition of affairs naturally forces buyers to go to headquarters for supplies, and Chili Bars have been more eagerly bought there by consumers this week than at any previous time. The masters of the situation have shown the former derelicts no special consideration. To the contrary, these buyers have been allowed to run the price up on each other. Meanwhile the screws tightened almost automatically upon "short" sellers' contracts on which deliveries are due this month and next. The result of the conditions noted is reflected

in an advance to £88 for Chili Bar prompts; £83 for Chili Bar futures, and £76 for G.M.B. contracts.

The price of Pig Tin has gradually softened, although still receiving a certain degree of support from the "bull" interest. It is stated that the shipments from the Straits will be heavy during the next 30 days, and also that colonial holders have shown some evidence of inclination to realize on at least a portion of their stocks. Still it is apparent that efforts are not spared to hold prices up while the endeavor is made to accomplish their purpose, and the "bear" interest have therefore gained but slight advantage. Outside speculation in the metal has been small during the week, and the alleged support from the American market reported a short time ago seems to be missing at the present time.

The position of the Tin-Plate market is still very strong. There continues to be a brisk demand for both near and distant future deliveries. Makers are so far sold that only a moderate amount of the demand for early shipments can be accommodated, and in most cases they are reluctant to enter orders for more distant deliveries at present prices. Steels are still in relatively the greatest demand. Shipments are running very heavy. A new Black Plate mill is soon to be started at Pontypool.

The Scotch Pig market shows a continued hardening tendency, and on the Middlesboro' product and Hematites the same is to be remarked. Speculation has figured less conspicuously than heretofore in shaping the course of the market. Increased demand from consumers is now the main basis of strength. In the Scotch trade American demand is also figuring somewhat prominently as an influence. Makers' brands have advanced 6d. @ 1/; Middlesboro' is 9d. and Bessemer Pig 6d. higher.

The Steel trade, with some few exceptions, is brisk and large orders are reported placed in some branches. The Scotch makers are said to be specially active and one firm is reported to have booked an order for 1000 tons Boiler Plate. Rails, Blooms and Rods are exceptional, and the prices on these are barely maintained.

The Manufactured Iron branch also continues brisk, with noticeable activity among the makers of Plates. Staffordshire Common Bars have been sold at 5/ advance and Black Sheets at 2/6 advance.

Old Iron Rails are firmer and in more active demand, with considerable inquiry from America reported.

Scotch Pig.—The market has continued active and prices are higher:

No. 1 Coltness, f.o.b. Glasgow.....	49/
No. 1 Summerlee, " ".....	49/6
No. 1 Gartsherrie, " ".....	46/8
No. 1 Langloan, " ".....	46/8
No. 1 Cambro, " ".....	42/6
No. 1 Shotts, " at Leith.....	46/6
No. 1 Glengarnock, " Ardrossan.....	44/9
No. 1 Dalmellington, " ".....	41/
No. 1 Eglinton, " ".....	41/

Steamer freights, Glasgow to New York, 6/; Liverpool to New York, 7/6.

Cleveland Pig.—There has been a further advance with active trading; No. 1 Middlesboro', G.M.B., 36/6; No. 3 do., 34/.

Bessemer Pig.—The market firm at 6d. advance and fairly active. West Coast brands, mixed numbers, 44/6, f.o.b. shipping point.

Spiegeleisen.—Good business passing at steady prices. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—Demand has been rather slow. Standard sections quoted at £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—No change in the market for these. We quote at £3. 12/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—Business very fair at steady prices. Bessemer, 2½ x 2½ inch, £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—Very little doing, and prices rather weaker. Bessemer, £3. 15/, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—The market is without change. Mild Steel No. 6 quoted at £5. 16/ and No. 5 at £5. 14/, f.o.b. at N. W. England shipping point.

Old Rails.—Demand fairly active and prices firm. Tees quoted at £2. 15/, and Double Heads £2. 17/6, free on board.

Scrap Iron.—Trade moderate at about former rates. Heavy Wrought quoted at £2. 5/, f.o.b.

Crop Ends.—Business slow and at unchanged prices. Bessemer quoted £2. 5/ @ £2. 7/6, f.o.b.

Tin Plate.—The market remains very firm. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/ @ 15/6
IC Bessemer steel, Coke finish.....	13/3 @ 13/6
IC Siemens " ".....	13/6 @ 13/9
IC Coke, B. V. grade.....	13/ @ 13/6
Charcoal Terne, Dean grade.....	13/ @ 13/3

Manufactured Iron.—The market continues strong and active. We quote, f.o.b. Liverpool:

	£ s. d.	£ s. d.
Staff. Ord. Marked Bars.....	@ 7 10 0	
" Common ".....	@ 5 0 0	
" Bl'k Sheet, singles.....	@ 6 17 6	
*Velsh Bars (f.o.b. Wales)....	4 12 6 @ 4 15 0	

Tin.—Steady, with a fair business. Straits quoted at £92 @ £92. 5/, spot, and £92. 10/ @ £92. 15/ for three months' futures.

Copper.—Market strong and active. Chili Bars, £88 @ £88. 5/, spot, and £83 @ £83. 10/ three months' futures. Best Selected, £78. 10/ @ £78. 15/.

Lead.—Steady market; demand fair. Soft Spanish, £13. 2/6.

Spelter.—Market continues very strong. Silesian, ordinary, £17. 7/6 @ £17. 12/6.

The steamer Umbria made her last trip out in 6 days, 6 hours and 14 minutes to Brow Head, easily beating the new Inman liner City of New York.

Hardware.

The trade for the month is winding up in a quiet manner and without any feature of particular interest. It is not probable that the business for the month will aggregate very large or turn out as well as was expected at the beginning, but we hear no great complaints, and a good fall trade seems to be generally expected. Manufacturers are running full and apparently making up stocks with confidence, but are cautious about placing orders for materials to cover any very long period.

Barb Wire.

A little more business is doing in the New York market, occasional orders for carload lots being taken, which we quote 3.9 to 4 cents for Galvanized. The crop outlook is giving encouragement to manufacturers, and the belief is expressed that should the good prospects now before the farmers be realized a growing demand would soon end the demoralized condition of the Barb Wire trade in the West.

Cut Nails.

The New York market is moderately active, with prices a shade firmer. There is but little cutting of the new schedule of extras. We quote \$1.85 @ \$1.90 for carload lots on dock, and \$1.90 @ \$1.95 for small lots from store.

Wire Nails.

At the meeting of the Western Wire Nail Association, held at Cleveland last week, prices on Standard Wire Nails were advanced to \$2.65, less 10 cents per keg, in lots of 240 kegs. For miscellaneous Nails the discount on less than 1 ton lots is 70 and 10, and for larger quantities 70, 10 and 5, for Cincinnati, Chicago and East St. Louis delivery, the terms being acceptance 60 days or 10 per cent. off, ten days. Since then the market has stiffened here, the majority of sellers asking \$2.55 for carload lots and \$2.65 for store lots, at New York. Another meeting of the Wire Nail manufacturers is to be held at Pittsburgh to-morrow to discuss plans submitted.

During the session of the Fork and Hoe makers, at Rochester, the manufacturers of Scythe Snaths also held a meeting and perfected an organization with a view to controlling the prices of their goods. The result of the meeting was that a discount of 50 per cent. was adopted as the price to the general trade, with extra discounts for quantities. The terms are 60 days from March 1, or 2 per cent. discount for cash in 10 days. Deliveries are the same as those governing the distribution of Forks and Hoes. In other words, it is an equalization of freights between the different makers.

An expectation seems to exist in some quarters that an advance in Shot is likely to take place on account of the increasing price of Lead, which has advanced considerably since the recent change in the price of Shot.

A. W. Paine, Peabody, Mass., will in future make four sizes of the Peabody Door Springs, of which the trade prices are as follows, with discounts for large lots:

No. 1, for screen doors.....	\$1.25
No. 2, for house doors and heavy screen doors.....	1.25
No. 3, for store doors.....	1.50
No. 4, for heavy store doors.....	2.00

The Covert Mfg. Company have issued the following revised discount sheet:

Our Louisville correspondent writes us as follows:

The jobbers in the Hardware trade make varying reports the past week. The extraordinarily heavy rains have had some bad effects on trade, especially down in the Cotton belt. The salesmen traveling in that part of the country say the merchants who have been often hurt by a little overbuying in bad crop years were afraid the cotton would be injured, making them quite wary for the present. Consequently those dealers who strive for this business particularly find it dull. Others report the heavy demand of last week to continue, and in some lines to increase. Bar Iron has been very quiet, little is offering from the mills and limited amounts are going into consumption. Heavy miners' and contractors' supplies continue in good demand. One house handling largely of these goods makes a point of carrying in stock every article enumerated in their catalogue, which fact brings its own reward. Those jobbers making a specialty of Wagon and Carriage goods say that trade was never better—in fact it is quite large enough to handle satisfactorily. The Hub and Spoke factories are all running full.

We are informed that Mr. E. Bertram Pike, who has represented the A. F. Pike Manufacturing Company on the road for the past two years, has associated himself with Mr. C. O. Danforth, of Boston, under the style of Danforth & Pike, manufacturers' agents. Mr. Pike will start upon his fall trip about September 1, still representing the A. F. Pike Manufacturing Company and several other well-known Hardware manufacturers.

Hartley & Graham, 17 and 19 Maiden Lane, New York, having purchased the entire stock of Colt's New Line 30-caliber and Colt's Old Model 22-caliber Revolvers, offer them at a very large reduction in price. They are all regular standard goods.

We have before us Sargent & Co.'s new catalogue, which is a handsome volume of 1100 pages, bound in cloth sides, red leather back, and of convenient size for handy use. About three-fourths of the book are devoted to their own manufac-

tures, everything up to page 858 being made at their New Haven factories. The remaining pages are taken up with miscellaneous Hardware and Tools, the goods shown being all regularly kept in stock. The first 240 pages are devoted to their line of Locks, of which about 50 pages are given up to new goods, among which a greatly increased line of Bronze Metal Door Knobs is particularly noticeable. A frontispiece gives a view showing the present extent of the works, including the new Lock factory, which is the latest addition, and will enable those who can compare this with the view of the works previously published to appreciate the additions which have been made to this establishment. The catalogues issued by Sargent & Co. are noted for the clear, compact and convenient manner in which they are arranged, and the volume before us is another conspicuous example of the same qualities, which are carried still further than in its predecessors. The arrangement of cuts and type is made with a careful view to the convenience of the trade in using the book, as well as with an eye to artistic effect, and with such success that we do not know of any book which excels it either in beauty or convenience. The mechanical part of the work is thoroughly well done, and it is printed on paper which makes a very good appearance, while it is thin enough to keep the thickness of the volume within reasonable bounds. This book is now ready for delivery, and will be sent to customers with the first lot of goods ordered, or, if desired, expressed to their address.

C. M. McClung & Co., Knoxville, Tenn., have added to their stock of Hardware and Cutlery a line of Stoves, Ranges, Grates, &c., of which they issue a handsome pamphlet.

The new catalogue of Tower & Lyon, 95 Chambers street, New York, is about double the size of their previous one. It is handsomely printed and very neatly bound in flexible cloth, with red edges. We notice that they have added to their assortment of Iron and Wood Bottom Planes until they now make some 75 numbers. They have increased their line of Tools, illustrating their Excelsior Expansion Bit and Wood's Extension Level, also the Stephen's Vise, of which they obtained control last year. They have dropped some items given in a former catalogue and are becoming more and more manufacturers of high-grade Tools. They illustrate a very full line of Police Equipments, with which Mr. Tower has been so long identified.

Under date of 25th inst. C. Sidney Shepard & Co., 23 and 25 Randolph street, Chicago, Ill., issue a fall circular which is principally devoted to seasonable goods.

The St. Louis Vise and Artesian Well Tool Company, St. Louis, Mo., manufacturers of Well-Drilling Machinery and Tools, issue their catalogue C. This company supply everything necessary for boring wells to any depth, and will furnish experienced operators, if required, to go to any part of the country. They have enlarged their facilities for turning out work and are now prepared to execute orders with dispatch.

Hibbard, Spencer, Bartlett & Co., Chicago, Ill., have issued price list No. 100, which is devoted to Firearms, Ammunition, &c.

Price List No. 123 has just been issued by the James L. Haven Company, Cincinnati, Ohio, giving revised prices of their goods up to date.

The Hartman Mfg. Company, Beaver Falls, Pa., have issued their first catalogue, giving illustrations, descriptions, price lists and testimonials of their patent orna-

mental and field fencing. This catalogue is extremely well gotten up for the purpose, giving a great deal of valuable information to persons interested in this line.

S. Freeman & Sons Mfg. Company, Racine, Wis., have issued their first illustrated catalogue and price list of the Freeman Ensilage and Feed Cutter, containing illustrations, full description and prices. It also contains a treatise on Ensilage and Silos, which will give it additional value.

Parkhurst & Wilkinson, 148-164 Kinzie street, Chicago, Ill., issue circulars stating that they are prepared to furnish Sweet's Toe Calks, both sharp and blunt. They quote discount 40 per cent. to merchants, provided they do not sell to smiths at better than 30 per cent. The list prices remain the same: Swedish, 13 cents; American, 11 cents; Bessemer, 9 cents.

Buck Bros., Millbury, Mass., desire us to make public the following regarding the annoyance which they have suffered from the substitution of inferior goods:

A number of our customers in the Southwest have complained to us that they have been imposed upon by an unprincipled drummer who claimed to be selling "Buck Bros." goods. These merchants say "they gave their orders expecting to receive our goods, but found on opening the packages that they had got goods of an inferior make and brand." To all such merchants we beg to call attention to our standing advertisement in *The Iron Age*, which cautions "buyers to be on their guard and not have inferior goods palmed on them by unprincipled persons, who represent them as our make." All our tools are stamped "Buck Brothers" in full, and our trade-mark is on all our labels. None others are genuine.

In the *Sacramento Daily Record-Union* we find the following, which will interest the friends of a gentleman who is perhaps as widely known as any one in the trade:

Among other arrivals in Sacramento yesterday was Col. Harry Comstock, a gentleman who enjoys the reputation of being perhaps the best-traveled commercial man on the Continent. He has spent years in India, China, Egypt and other far foreign lands while pushing American manufactures to the front, and is better known among the nobility in those distant lands than many of our diplomatic agents, as his dealings have always been with Government officials. It is owing largely to Colonel Comstock's energy and business abilities that American-made arms are so largely used in the armies of China, Japan and other foreign lands, as it is in this department of commerce that his talents have been usually employed. Since then Colonel Comstock has established himself at Syracuse, N. Y., as one of the firm manufacturing the New Baker Fowling Piece. His long experience as a commercial traveler, he says, had convinced him that a great demand existed for a Gun that would equal in shooting qualities and durability the higher-priced Arms and at the same time be within the reach of sportsmen of moderate means, and this demand he claims his firm are now engaged in supplying. Having placed some orders here, Colonel Comstock departed for San Francisco, whence he will go through Texas, New Mexico and the Southern States, and will be in Sacramento again in the spring.

The new works of the Hartman Mfg. Company, at Beaver Falls, Pa., manufacturers of Patent Steel Picket Fence and Gates, and Corduroy and Diamond Fencing, are now in full operation and with the addition of two new fence machines, the firm have been enabled to catch up with their orders. The new machines are built especially for the manufacture of the Farm or Field Fence, which is the latest novelty brought out by the firm. This Fence is to compete with the wood slat picket fence which has had such a large sale through the West.

Dealers of Different Type.

In a recent issue of one of our exchanges appeared an article in which two types of dealers were described. One was designated as a man happy and contented, with plans outlined for the future and successful in this business; the other, nervous, irritable and gloomy, disagreeable to his

customers, and unable to give proper attention to those details which render a business profitable. The article sets forth the reasons for the conditions existing in both cases, and as it is of general interest to the retail store trade we take pleasure in republishing it herewith.

We have in mind a bright-eyed, rosy-cheeked business man, far past the noon meridian of life, but who seems as yet to be but a young man in tastes, habits and thought. You go into his store to call on him, and you are greeted with a pleasant word, a cordial handshake and an easy chair. He will sit down with you as if he did not have a large business depending entirely upon him for its successful operation. He looks you square in the eye and makes you feel perfectly at ease in his presence. He dismisses business entirely if you are making a social call, or he transacts business with you in a charmingly open, free-hearted manner that wins you at once to his long list of friends. He jokes with you about his age, says his life is not nearly spent yet, does not fear to die, has no pressing obligations, has good credit, can buy any amount of goods he needs without being questioned, because his credit has long been established. He gives an hour or so to you without appearing to feel that you have robbed him of an expensive article. He invites you to his house to dine with his family. He preaches to you of contentment and happiness, and is a living illustration of his text. He romps with his children, who meet him at the gate. He kisses his wife, who has the same contented smile, and his mother rises up and calls him blessed. He tells you, when you have enjoyed dinner, and are sitting out in the shade for a quiet smoke, why this is all so. To sum up the whole of his talk is one brief sentence: He is living six months ahead. He plans for the future; borrowed money when starting in business for six months, and paid it back at the expiration of three; bought goods on three months' time and paid in thirty days, and thus established his credit; gathers money together to conduct his business through six months' bad weather, bad trade, and bad markets, and keeps it there. He has a reserve capital, a reserve fund of good nature, capability and happiness. He dates all his calculations six months ahead, and is ready to carry them out when they mature. He has his life insured, his property insured, and his will made in due form. In a word, he is always ready. Do you know him?

We know a man who is nervous and irritable; his mouth is drawn into hard, set lines. Gridiron wrinkles furrow his forehead; his fingers are constantly winding about each other when disengaged. When you go into his place of business you are not apt to find him in, and you suspect (if you know him) that he is "shinning" to secure money to meet obligations. If you do find him in he will look over your shoulder while talking with you, as if constantly expecting some disagreeable visitor. If at his desk, he will nervously twist a pencil or pen in and out his fingers; he does not look at you, save for a moment at a time. If you sell him goods he buys them as a sucker takes the hook, without investigation or consideration, and you have a feeling that you have made a bad sale. He is not cordial or desirous of continuing conversation with you. He is gloomy, moody, desperate. He is constantly trying to force away disagreeable necessities until to-morrow. He has a note due at the bank to-day, but he does not pay it. He will take the three days of grace and then renew it at a high rate of interest. Interest is a famishing vulture gnawing at his vitals. He cannot attend to his business. The pain is so great that he must walk the street, get out of doors, where air and sunshine are perfectly free. His rent is not paid for last month. He has

accepted drafts which must be met, but he has no money with which to keep them from going to protest, so he preys on his friends and relatives for money to tide him over. His time is so occupied in attempting to bridge the chasm made by the growing flood of credit he himself started that he has no time to attend to his business. His subordinates have not the judgment or tact to manage as carefully as he needs, and things are going from bad to worse constantly. He exchanges checks with friends and deceives his banker as to his real condition. His employees are his creditors, and also are solicited to borrow money from friends to loan to him. His property is mortgaged to its full value. He borrows money with which to pay dividends or supposititious profits in order to deceive the innocents whom he has roped into his business. He pays no bills until he is obliged to in order to save action at law. He is a miserable man—a felon by implication. When he goes home he has no word for his wife and children, who have grown to have a little circle of their own into which the father does not enter. His mind is so worn with constant drudgery that it is near to breaking down with his credit and his business. Is there any man more pitiable? And why is he in this condition? Because he is six months behind in his calculations and his life is one continual jump, hampered as by heavy weights, to make up the six months and bring himself to date.

Engineer Menocal, of the Nicaragua Canal, just returned, gives a very flattering account of the progress of the survey. The perfected route as it now stands is at least 25 per cent. better than the one of 1885. The then estimated length of 40 $\frac{1}{2}$ miles has been cut down to 28 $\frac{1}{2}$ miles, and the minor surveys now going on are expected to reduce this to nearer 28 miles. The heaviest part of the work is the making of a cut 119 feet deep through a $2\frac{1}{2}$ mile stretch of solid rock. About 16 miles of the work will be dredged and the balance of the 9 miles is firm, low-lying ground that will only have to be dug to a depth of 20 feet. The canal is to be 120 feet wide through the greater part of the distance, with sharply sloping sides that will not have to be walled up. Through the rock section it will be but 80 feet wide with nearly vertical sides. The whole canal will have an average depth of 30 feet and will be able to accommodate the deepest draft vessels. Mr. Menocal expects to get authority to commence the work of construction at an early day.

The great majority of the convicts at present confined in the New York State prisons are idle, as the result of the passage of the prison bill at the extra session of the Legislature. As many as possible are employed in making repairs. Sing Sing alone previously turned out 3300 pair of shoes daily, and from 175 to 200 stoves.

Steamship men in New York are not in the least surprised that the Umbria arrived out on the other side many hours before the new steamship City of New York, bound to the same port, and the expectation that the latter will eventually rank among the fastest steamers afloat is in no wise diminished. To have forced the engines of the City of New York to their utmost capacity would have been ruinous, mechanically and financially. Even under the moderate stress to which she was subjected on her initial trip havoc was made with the brass boxes. Steamships might be named which developed surprising speed at the commencement of their career, beyond anything they were again able to attain. It is an unenviable reputation that is gained at so large a cost.

The Barton Bell Company.

This company have completed their factory at Marion, Ind., and are now ready to supply the wants of the trade in their line. They have two buildings, both of brick, with iron roofs. One is two stories high, 110 x 32, and constructed on the plan called "mill construction"—i. e., instead of floor and roof joists placed near each other they have girders 31 feet 6 inches in length and 14 x 8 inches running across the building 10 feet from centers upon which was laid double flooring. The second building is one story, brick, 90 x 32 feet, with steep roof, one-third pitch. The only woodwork in this building is the roof joists, window frames and sash. This latter building is the foundry, while the lower story in the two-story building is for offices and turning, polishing and plating bells, and the second story for the Strapping department and for assembling the various goods manufactured, as well as for storing the stock of finished goods. In the construction of these buildings the company have complied with the specifications recommended by the New England Manufacturers' Mutual Insurance Association, and the risk has been pronounced one of the best in the West. They have also added materially to their machinery. The rolling barrels were manufactured by Henderson Bros., Waterbury, Conn., and are constructed so that the air and dust are exhausted from the barrels, thus protecting the health of the operatives employed in that department and resulting in a superior finish to those Bells which go on the market without additional polishing. The engine is a high-speed automatic engine, manufactured by Chaudler & Taylor, Indianapolis, Ind. The boiler is made of three-eighth steel by the Erie City Iron Works, Erie, Pa. They claim to have a model plating room. The dynamo is a Mather machine, and was furnished by the Eddy Electric Company, Windsor, Conn. The polishing and buffing room is fitted up with patent spring bearing polishing lathes, which insure a steady motion of the wheels and consequently a superior class of workmanship. There is a natural gas well connected with the works, supplying an abundance of natural gas for the numerous processes requiring heat.

The company are enthusiastic as to the advantages of their new location, both as a producing and distributing point. They say: "Owing to the fertility of the soil farm produce is abundant and cheap and the price of labor is low. Marion is situated about the center of the Indiana gas field and the county wholly overlies the gas bearing stone, a failure to procure gas never having occurred in Grant County, of which Marion is the county seat. Marion is about centrally located in the circle formed by the following cities: Toledo, Detroit, Cleveland, Columbus, Cincinnati, Louisville, St. Louis and Chicago. We have three lines of railroads—the Pennsylvania system (Columbus and Chicago division); the Cincinnati, Wabash and Michigan, running from Indianapolis to Benton Harbor, Mich.; and the Toledo, St. Louis and Kansas City, running from Toledo to St. Louis. We have three express lines—the Adams, United States and American; also the Western Union telegraphic service. Marion has, in addition to natural gas, artificial gas and electric lights for illuminating, and a bountiful supply of artesian well water. Its superior geographical position, natural gas and the other advantages enumerated make it a most desirable place for the manufacture of our goods, which are consumed largely in the West and Northwest. We wish to call the attention of the trade to advantages which will accrue to them: Possibility of lessening the

cost of goods will inevitably result in lower prices to the consumer; the great saving in freight rates owing to our favorable location, and the fact that they will be able to procure quickly Sleigh Bells, which are generally wanted at once or not at all.

Recent Legal Decisions.

TRADE-MARK—DAMAGES FOR INFRINGEMENT.

F., a dealer in shoes, used the trade-mark of B.—"C. Benkert & Son"—on 250 dozen pairs of boots and shoes, and a suit was brought for the infringement. The damages claimed were the profits made on the goods sold, but defendant insisted that he should account only for the difference these boots and shoes would have sold for without the plaintiff's trade-mark on them, and the price at which they were sold with the trade-mark on them. In this case—Benkert *vs.* Fider—brought in the United States Circuit Court, Northern District of California, the court gave the plaintiff the full profits. Judge Sawyer, in the opinion, said: "The rule of damages insisted upon by the defendant is not the proper measure of damages. I am unable to adopt any such rule. It would be extremely indefinite, and equivalent to giving no damages or profits at all. How would it be possible for any one to say how much less a pair of boots or shoes would sell without than with the trade-mark upon it? There would be no definite measure of compensation for the injury. One who deliberately and knowingly uses another's trade-mark commits a palpable and unmitigated fraud, for which there is no possible excuse. He seeks to avail himself of the good reputation of another's goods, and puts his own goods—which are, usually, if not always, of an inferior quality—upon the market, thereby not only fraudulently cutting off the market from the party who by years of labor, and at great expense, has established a reputation for his wares, but in addition to this injury destroys or injures largely that reputation which is the foundation of the owner's business, by selling inferior goods under his trade-mark, thereby leading the world to believe that these inferior goods are those of the genuine maker. In my judgment the defendant should account, at least, for the entire profit made by him on the sale of the goods with the fraudulent trade-mark on them. There is no just analogy with respect to profits and damages between the infringement of a trade-mark and a patent for an improvement in a machine. A machine may embrace inventions for half a dozen improvements, for each of which a patent is held by different individuals. One machine might infringe them all, and then each patentee could recover the profit attributable to his separate invention. The trade-mark sells the whole article, however inferior or injurious in that particular, and prevents the sale of the owner's goods of equal amount. At least that is the fraudulent purpose and the natural tendency, whether always accomplished or not; and the injured party should have, at least, the whole profit resulting from the wrongful act, and such I understand and hold the rule to be. The damage may be much more arising from destroying the reputation of the owner's goods."

ASSIGNMENT FOR BENEFIT OF CREDITORS.

L. made a general assignment to A. on October 26, and A. at once went into possession and began to sell the property. On November 12 L. died, but A. continued to sell and dispose of the property after his death. Two months after L.'s death the balance of the stock was sold at auction, and A. applied most of the proceeds to the

preferred debts specified in the judgment. An unpreferred creditor attacked A.'s course, and sought to hold him personally liable for the appropriation of the property, but was defeated in the action, *Chattanooga Stove Company vs. Adams*, and an appeal was taken to the Supreme Court of Georgia, where the judgment was affirmed. Judge Simmons, in the opinion, said: "Though we do not agree with the court below that the assignment was valid, yet no fraud being alleged in making it, and it being shown that the assignee has acted throughout in good faith, we cannot hold him liable as one acting as an executor without authority can be held liable. This is not a case where a person intermeddles after the death of person with the goods of the deceased, but is one where the owner has put him into possession, under a deed, before his death."

ATTACHMENT—MALICIOUS ACTION.

H. & Sons were creditors of B. & McC., and they could not make a prompt collection of their bill for goods sold, and they caused an attachment to be issued, on the ground that B. & McC. were about to dispose of their property to defraud their creditors. H., who made the affidavit, said he thought he had good grounds for his action; that he had called on the firm for payment, and that B. had said to him that McC. was neglecting the business, by frequenting drinking saloons during business hours, putting the whole burden on him, and that he, H., took the course he did fearing that a chattel mortgage would be put on the stock in trade. B. & McC. were solvent, and before the attachment was served the debt was paid. But the sheriff's officer remained in the store, refusing to leave, though B. assured him that the debt had been paid, until he, B., brought word from H. & Sons that there was no claim; and he did remain until a clerk from H. & Sons came and told him that the matter had been arranged. And the principal daily paper in the city stated: "In the Superior Court, yesterday, I. H. Hinchman & Sons swore out an attachment against Charles R. Brand and Gilbert McCullough." Damages were shown in the suit brought for malicious prosecution, and a judgment was recovered for \$625 in the case, *Brand vs. Hinchman*, and the defendant appealed to the Supreme Court of Michigan, where an affirmance was had. Judge Morse, in the opinion, said: "Defendants contend that an action for malicious prosecution will not lie unless there has been a seizure of property, or the arrest of a person, but here there was, at least, a technical taking possession of property. 2. It is further contended that the action will not lie for a civil action based upon a claim, but we are notified that this action is maintainable. Plaintiffs show they were damaged by the course taken, and that there was no reasonable ground for the attachment. There are few, if any, wrongs for which the law does not provide a remedy, and if a man is hurt or damaged in his property, business, credit or reputation by the malicious commencement or prosecution of a civil suit, without probable cause, the better doctrine is that he can maintain an action for his hurt or damage."

Since July 1, 1888, Fairbanks & Co., St. Louis, have sold 14 Westinghouse engines, aggregating 1280 horse-power. They are now preparing plans for the power plant of the Omaha and Council Bluffs Bridge and Railways Company's electric railway.

An alleged discovery of nickel in Logan County, Kansas, causes much excitement in that region

Lavigne's Breech-Loading Yacht Cannon.

An improved saluting cannon for yachts, known as the Lavigne patent breech-loader, has been recently brought out by R. H. Brown & Co., New Haven, Conn. Fig. 1 shows the general appearance of the cannon, and Fig. 2 illustrates the working of the breech block. The special feature to which the manufacturers

inches, and they also inform us that muzzle loading can be remodeled into breech loading guns with this block. The Lavigne cannon is designed to take standard shot shells, either paper or brass, thus avoiding the trouble of having special shells made to order.

At last Louisville, Ky., has a genuine cotton factory in course of erection which will be completed and running by Decem-

the machinery, &c., and Mr. Lane, manager of above factory, will be manager and superintendent of the new works, the old small concern being absorbed by the new company. The capital stock of the company is \$500,000, with \$200,000 paid in. The president is W. A. Robinson, and the directors are from among the most energetic and successful men of the city. The product of the mill will be entirely warp, and they will begin with an order for \$80,000 from one woolen factory. If the warp mill meets with ready success as is expected, the company will next year put up another factory, to run on sheetings and plaids.

The Eon Fence Post.

A very practical metal fence post has been invented and patented by Charles S. Long, of Aurora, Ill. The constantly increasing scarcity of timber in many parts of the country caused his attention to be drawn to this matter, and, after years of experiment, he has perfected the Eon post. It is clearly shown in the accompanying illustration, which also covers details of the various parts. It consists of an iron or steel bar, with a base of asphaltic concrete, crushed or pulverized stone pressed on it while hot by a powerful machine. The bar is of trigonal section, as shown by B in the cut, although

Lavigne's Breech-Loading Yacht Cannon.—Fig. 1.—Breech Closed.

direct attention is the strength and simplicity of the breech block mechanism. Fig. 1 shows the breech block swung around to permit loading. It will be noticed that the pivot is directly above the bore, the advantage claimed for this construction being that the pressure is equally distributed, so that there is no danger of the breech opening when the cannon is discharged. Furthermore, the heavy rib B, Fig. 2, which, as shown, ex-

ber 1st. The Louisville Cotton Mills Company have located their plant at the intersection of the Short Line Railroad and Shelby street. They have 17 acres of ground and a frontage of 600 feet on the railroad. A switch has been run in, by which they are receiving the heavy materials for construction. The warehouse is nearly completed, measuring 150 x 60 feet, and is for storing both raw material and stock. The factory is in course of

The Eon Fence Post.

Fig. 2.—Breech Open.

tends above the bore, gives a strong support to the breech block. Another feature of this arrangement is that it allows for an increased length of barrel, from 2 inches on the small size to 6 inches on the large size. To fire the cannon a lanyard is attached to the pin A, Fig. 2, and pulled directly back, thus releasing the hammer which explodes the primer. Messrs. Brown & Co. are preparing to furnish the cannon in sizes of 12, 18, 24 and 28

erection, and will be 305 x 78 feet, three stories high. There will also be engine house and dye houses. The engine is an Eastern Corliss, 400 horse-power, made at Providence, R. I. All of the machinery is new and made expressly for this mill. It was designed by Eastern experts. Home capital almost entirely controls the enterprise. Mr. J. L. Peck, owner of a small warp mill formerly operated in Louisville, has the direction of purchasing

other shapes could be made, if desired. Each revolution of the rolls make one post, which can thus be easily tapered, so as to be heaviest at the place most likely to be broken. Nibs on the rolls 1 inch apart leave a thin web, which can be punched out to space fence wires as wished. In the cut A represents the stay for fastening the fence wire to the post; C holds the wire in the loop of the stay; D shows how C is used. The stay is made of No. 1 stiff wire. Boards can be used with these posts as well as wires. An ordinary post will contain about 5 pounds of metal. The base, as will be seen by the part cut away at E, has a cavity in the bottom, which adds to its rigidity when in position. A special machine, designed and patented by Mr. Long, is used for pressing the bases on the posts, pressing on five per minute. This base is claimed by the inventor to be moisture and water proof, so that frost cannot disintegrate or crack it, while at the same time there is no seam or crevice between the post and the base, so that water cannot enter to rust the metal nor can frost take effect at that point. The inventor desires to make arrangements for the manufacture of this post on royalty, and solicits correspondence. The arrangement will include the right to use his patent press for the bases. He further states that they can be produced at very low cost.

New Grooving Machine.

A. V. Allen, Joplin, Mo., is introducing a new form of grooving machine, an idea of which will be gained from the accompanying engraving. The lower part of the machine consists of a common hollow mandrel, a tool well known to all sheet-metal workers. Above this is fast-

New Grooving Machine, Made by A. V. Allen, Joplin, Mo.

ened a goose-neck under which runs the grooving roll. Mr. Allen informs us that any mandrel may be used, provided it is straight, or the machine is supplied fitted to the mandrel, as the preferences of the buyer may be. Special attention is directed to the fact that the power is applied directly to the grooving wheel, and that no complicated gearing is required. The features of construction in the machine are so clearly shown in the cut that extended description is unnecessary. The maker asserts that this machine is the result of long experience, and the careful trial of a considerable number of those machines which have preceded it in the market.

The Suez Canal is the cause of atmospheric changes which may have an effect of great importance in shaping the destiny of Egypt. Rains are now falling in Cairo and along the delta of the Nile, before almost unheard of. Dr. Chas. S. Robinson, of this city, notices the arrival of "new forces of disruption from without," and climatic changes most unexpected and peculiar, so that even the mummies, so long preserved in their dry cerements, are now liable to perish from the presence of moisture, before unknown, which percolates through their rocky covering. He says: "Whereas at least until 1878 such a thing as rain was entirely unknown in Cairo, there is nowadays one perpetual and almost tropical downpour, commencing in November and lasting until March," which accounts for the prevalence of typhoid and other forms of malarial fever. And, as might be expected, the manner of constructing dwellings and the mode of life are undergoing a radical change. Roofs must now be made water-tight and "fire-places and stoves have already made their appearance," instead of the old-time open braziers. The prospect of a new market for stoves, so near the equator, and from causes so remarkable, will scarcely escape the attention of American manufacturers.

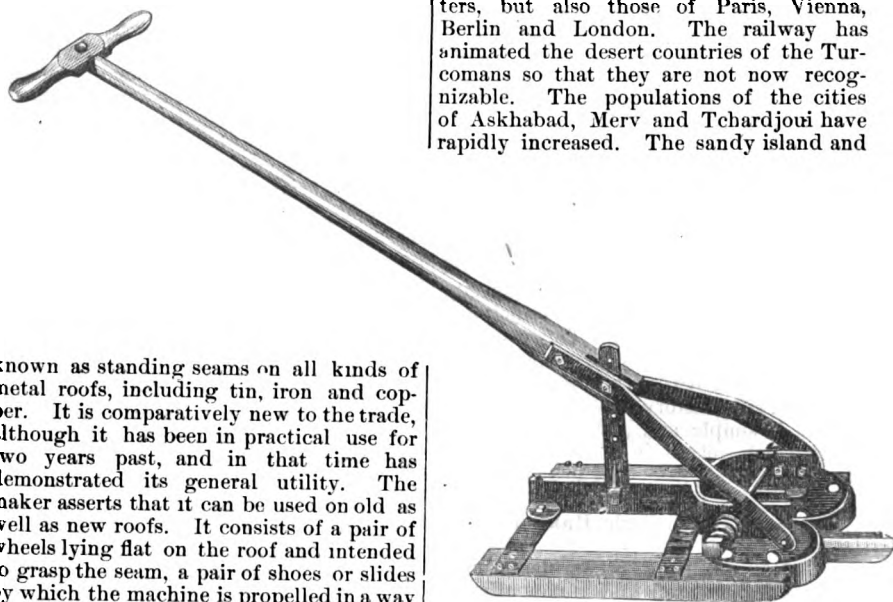

A fatal collision of the Pacific steamers City of Chester and Oceanic a week ago inside the Golden Gate was almost a repetition in its general features of the disaster that befel the Geiser and Thingvalla off Newfoundland a week before. In the latter case sight was obscured by heavy rain, while the City of Chester was run into amidships during a thick fog, the consequence of which was that she instantly sank in deep water, with a loss of 13 lives. Until there

is some method of signalizing by means of light or sound when the weather is thick, collisions at sea are unavoidable.

New Double Seamer.

F. P. Baldwin, of Baldwinsville, N. Y., is introducing a new machine for compressing the double seams on rib or raised

seam roofs. A general view of the device is presented in the first of the accompanying engravings, while the other illustrations show the work performed by it at different stages of the operation. The machine is designed for closing the seams

New Roofing Double Seamer.—Fig. 1.—General View of Baldwin's Seam Compressor.

known as standing seams on all kinds of metal roofs, including tin, iron and copper. It is comparatively new to the trade, although it has been in practical use for two years past, and in that time has demonstrated its general utility. The maker asserts that it can be used on old as well as new roofs. It consists of a pair of wheels lying flat on the roof and intended to grasp the seam, a pair of shoes or slides by which the machine is propelled in a way to avoid injury to the roofing, and the handle for operating. The wheels are adjustable, so that the seam can be closed more tightly at the bottom than at the top, thereby securing a water-tight seam and at the same time avoiding the danger of cracking the metal at the top of the seam. In using this device the seams are turned in

Fig. 2.—Different Stages of the Work.

the usual way. After the double seam is turned as shown in Fig. B of the second engraving, which may be accomplished with the mallet or tongs, the compressor is put in place and pushed down the roof. The effect of the machine is shown in C of the engraving referred to. The maker advises in the use of this machine the keeping of the springs loose at the outset and

tightening them up as familiarity with the machine is gained. The maker claims that in using this machine an absolutely watertight seam is produced; further, that the work is done faster and easier than by the old plan, and that the seams are uniform and more perfect than can be produced in any other way. At the intersection of the standing seam with the cross-seams, the latter, it is claimed, are closed more perfectly than can be accomplished by any other device now in use. The further advantage, to which allusion is made in the circular before us, is that the use of this device avoids heavy and laborious stamping, and does not jar the roof, which, in many cases, is very objectionable. A number of testimonials are presented from those who have used this device, all speaking of it in the highest terms, and several referring to the use of this device on roofs which had been leaky and which were entirely cured by this plan.

About three months ago there was completed in Russia a railway nearly 900 miles in length, connecting Central Asia with all important points in Russia, called the Trans-Caspian. Respecting its commercial importance a correspondent of the *Journal de St. Petersburg* recently wrote: "What an immense field is opened to commerce by the new line! Thanks to it, the rich Turcoman carpets, the wool of merinos, the silk of Bokhara, the leather, the silk stuffs of Samarcand and the products of the minor industries of these countries can in 12 or 13 days not only reach the Russian commercial centers, but also those of Paris, Vienna, Berlin and London. The railway has animated the desert countries of the Turcomans so that they are not now recognizable. The populations of the cities of Askhabad, Merv and Tchardjoui have rapidly increased. The sandy island and

desert of Ouzoun-Ada are transformed into a bay of the first order, with a town having its streets, squares, bazars and a church. It is entirely owing to the railway that the gigantic undertaking of the restoration of the dyke of Sultan-Bent, on the Mourgah, destroyed 300 years ago, can be executed, and thereby call back into life the ancient granary of Central Asia."

The steamship City of Birmingham sailed from Savannah on Friday for Philadelphia with a cargo of 2100 tons of pig iron brought from Alabama furnaces by the Georgia Central Railroad.

Findlay, Ohio, now has six gas wells all "gushers," whose combined capacity is about 40,000,000 cubic feet of gas per day.

The Eureka Shear.

The Smith & Egge Mfg. Company, Bridgeport, Conn., are offering the trade a very effective tool for cutting wire rods and sheet metal in strips, a view of which is presented in the accompanying illustration. From an inspection of the engraving it will be seen that the device consists of a stock shear, the jaws of which are actuated by a rack and pinion movement. At the end of one arm of the shear is a segmental rack, in which engages a pinion attached to the second arm of the shear. The pinion is turned by a lever, clearly shown in the engraving. By this arrangement of parts great power is secured. Attached to the jaws, and projecting at right angles to them, is a gauge for convenience in cutting metal to length. In cutting round wire steel dies are inserted in the shear, and these are adjustable for different sizes. In the construction of the dies and cutters we are informed that the best tool steel is employed. As will be seen from the engraving, provision is made for attaching the shear to a bench, or, if preferred, it can be placed securely in a vise.

The Eureka Shear.

It is made in two sizes, No. 1 cutting round metal up to $\frac{1}{4}$ inch and sheet metal up to $\frac{1}{2}$ inch, while No. 2 has a capacity for cutting round metal up to $\frac{1}{2}$ inch and sheet metal up to $\frac{3}{4}$ inch. The company claim that the device can be operated with great ease, that it is very convenient in a metal-working factory or hardware store, that it is simple and durable, and of a price which places it within the reach of all.

New Eave-Trough Hanger.

Mr. Henry B. Todd, of Meriden, Conn., has recently patented and is now offering to the trade an improved adjustable eaves-

New Eave-Trough Hanger.—Fig. 1.—Hanger Applied to Trough and Fastened to the Roof.

trough hanger, the general construction of which is indicated in the accompanying engravings. Fig. 1 of the illustrations

shows the hanger in position, while Fig. 2 represents the cross-bar and strap. It will be found convenient for reference to bear in mind that similar letters indicate similar parts of the hanger. In the engraving

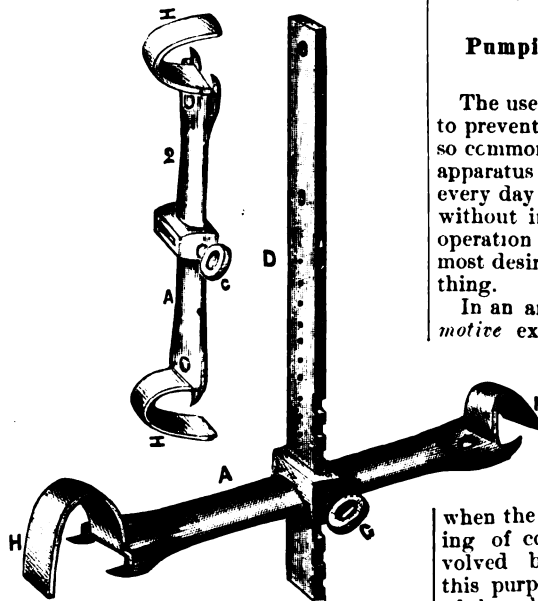

Fig. 2.—Cross Bar and Strap.

ings A represents a cross-piece of malleable iron, provided at each end with two sharp projections or points. Between the latter, and fastened to each end of the cross-bar, is a clasp H H, designed to fold over the edges of the trough and force the points above referred to through the metal composing it. This is accomplished by means of special tools furnished by the manufacturer. The strap D, shown in Fig. 2, inserted in the cross bar, is provided with notches at one end, into which is turned a set-screw, firmly holding it in place. The dots upon the side of the strap are designed for convenience in giving the trough the proper pitch or slant. The first strap is intended to be bent at the first dot, as at D, Fig. 1; the second strap at the second dot, and so on for as many hangers as are required for any particular trough. This, it is claimed, will give the proper slant, provided the building is level, but if not the trough can be lowered still further by means of the notches and set-screw already mentioned. In fastening the cross-bar to the trough the edge of the latter is inserted between the two projections and the clasp, as shown at H, the points being forced through the tin by compressing the clasp. The points on the opposite end are forced through under the sole, while the strap clasps it on the outside. By this means the cross-bar is attached to the trough in a very substantial manner, and without the use of solder. The manufacturer states that special machinery and tools have just been completed for making the clasps shown at H H in the engravings of the toughest kind of wrought material. The parts are formed and riveted to each end of the cross-bar, as shown in Fig. 2 of the illustrations, when the whole is neatly tinned. The maker claims that the use of these fasteners save much time and labor in putting up eave-troughs, and at the same time present a very neat appearance. The use of these hangers is said to allow of the adjustment of the trough at any pitch desired, and also of its easy removal for painting or repairs. The hanger is very durable in all its parts, and has been thoroughly tested. The goods are packed for shipment in one gross boxes, the straps varying in length from 8 to 12 inches.

A director of Denver says the coal traffic of the road is enormous, the Rock Island alone taking 1000 tons per diem, and ship-

ments are made over the Quincy as far as Lincoln, Neb. Anthracite is shipped as far as Kansas City and there competes with the Eastern product. Equipment is behind necessities. More locomotives and cars will be ordered.

Pumping Solvents into Boilers.

The use of something to remove scale or to prevent its formation in steam boilers is so commonly necessary that some sort of apparatus for introducing it into a boiler every day in the form of a solution, and without interfering in the least with the operation of the boiler, will be found a most desirable, convenient and economical thing.

In an article on the subject the *Locomotive* explains that in most steam plants if the use of a solvent is found to be necessary there is no way to get it into the boilers without shutting them down, cooling off, and introducing it through the manhole or hand-hole. If this is done only

when the boilers are opened up for cleaning of course no extra expense is involved but as a rule the stoppages for this purpose are so far apart that the use of the solvent amounts to very little, as in the natural course of running it will be entirely blown out and lost long before the next charge can be introduced. If a stop is made as often as the solvent should be introduced for the special purpose of putting it in, great and unnecessary expense is involved. The loss entailed by one such stoppage would more than pay for a proper apparatus for introducing it daily or oftener if desired, and in the form of a solution. And it is plain that small quantities in solution introduced at short intervals will be much more effective than a large quantity at longer intervals, and, when water is very bad, a much greater quantity of the solvent can be used in a given time than can be where large quantities are put in at longer intervals. For illustration, with some waters a charge of 30 pounds of soda ash once a month might cause serious trouble for a while after it was put in, but 1 pound a day could not possibly injuriously affect the working of the boiler.

Our contemporary accordingly gives an engraving of a very simple apparatus for attaining the desired result. It can be attached to any pump or injector at a very slight expense. To the upper end of the suction pipe of the feed pump another pipe is connected by means of the T, and extended to any convenient height. This pipe is provided with a stop valve, and carries on its upper end a receptacle for the solution which it is desired to put into the boiler. This may be an iron or a wooden vessel, as may be preferred, and of any required size. This vessel is filled with the solution while everything is running as usual. If the pump is drawing its supply, the only thing necessary to do is to open the valve connecting with the vessel above and its contents will be put into the boiler with a few strokes of the pump, when the valve may be again closed until it is wanted for use again. If, on the contrary, the pump is drawing its supply from some source which exerts pressure, more or less, as is frequently the case, the stop valve in suction pipe should be closed while the connection to the open vessel of solvent is open, or it would be driven out of the top of the vessel. But in either case a few moments suffice to complete the operation without any interruption to the operation of pump or boilers.

The Germans have successfully established themselves at 14 trading ports on the coast of Zanzibar.

AUGUST 29. 1888.

THE IRON AGE

THURSDAY, SEPTEMBER, 6 1888.

SPEECH RECORDERS AND REPRODUCERS.

For years the registering and reproducing of sound by mechanical means have been subjects of interesting study, the prosecution of which has finally given results promising to be of direct commercial value. There are undoubtedly some among our readers who remember the first measurable successful attempt in this line made public about ten years ago, the apparatus used being the Edison phonograph,

ferred the sound vibrations of the disk. A series of indentations were thus produced on the tinfoil, which, being a non-elastic substance, retained them. If now the part which the mouthpiece played was reversed, the indented tinfoil could be used to reproduce the sound. This was best effected by a special mouthpiece of larger size, with a diaphragm of similar construction. This was so adjusted that the point was made to work along the indentations, setting the diaphragm in vibrations, which, being communicated to

a number of experimental stages. In its present shape it gives every promise of meeting the requirements of a practical substitute for a stenographer, taking dictations as readily and, in fact, more accurately and reproducing them for transcription by typewriter or other means when required. For this purpose it will shortly be offered to the public. The main principle of Mr. Tainter's phonograph-graphophone is the same as that underlying Mr. Edison's improved apparatus, though in detail the two differ, as will be

Fig. 1.—The Edison Phonograph.

SPEECH RECORDING AND REPRODUCING APPARATUS.

to descriptions of which it is of some interest to refer at the present time. Compared with what has more recently been accomplished, this original machine appears as a rather crude device, though the character of the results which it yielded was striking and the mechanism exceedingly simple. Briefly described, it consisted of a cylinder coated with tinfoil, and so mounted in a frame that by means of a crank and screw a rotary and at the same time a longitudinal motion could be imparted to it. The sound to be recorded was directed into a mouthpiece closed by a thin elastic metal disk. By means of a spring a small steel point, rounded at the end, was fixed to the back of the disk and pressed gently against the surface of tinfoil, to which it trans-

ferred the sound vibrations of the disk. A series of indentations were thus produced on the tinfoil, which, being a non-elastic substance, retained them. If now the part which the mouthpiece played was reversed, the indented tinfoil could be used to reproduce the sound. This was best effected by a special mouthpiece of larger size, with a diaphragm of similar construction. This was so adjusted that the point was made to work along the indentations, setting the diaphragm in vibrations, which, being communicated to

the air, reproduced the sound more or less accurately. Experiments with this early instrument, which we witnessed at the time, showed that sound could be reproduced with it so as to be heard by a large audience. The sheet of tinfoil could be kept for an indefinite period, and could be made to give reproductions when desired. The tinfoil cylinder was turned by hand, the attempt being made to give it as uniform and regular a motion as possible. For physical laboratory researches the apparatus was employed to a slight extent, but was not adapted to any special practical use.

The engravings which we give in this issue, however, show the latest and most improved form of the phonograph, which, as may be readily imagined, passed through a number of experimental stages. At present there are in existence only a few of Mr. Edison's phonographs of the latest type, and we were kindly given opportunity to examine, photograph and sketch one, and are thus enabled to first present it to our readers. It is in this form that it will be offered for public use. The general view will show at once that important modifications have been made. To begin with, in the later instruments, as in this one, the recording cylinder coated with tinfoil has been superseded by one of hardened wax. This is slipped over a mandrel mounted on a spindle which at the opposite end is threaded and rests in two bearings. Behind the spindle and the wax cylinder is a rod, upon which is arranged a slide, having at one end an arm, carrying a pivoted head with two dia-

phragms, one for recording and the other for reproducing sounds, and at the other end an arm adapted to engage a screw cut on the spindle, and also, by a hooked portion, another screw nearer the front, called a "kick-back" screw. The manner in which the arm is thrown into and out of gear with the screws will be better understood from Fig. 4. In Fig. 1 it will be noticed that at the extreme front right-hand end of the machine is a milled head controlling, as shown in Figs. 4 and 5, a small cam which can be made to tilt the pivoted bar A through a certain angle, which will be shown by an index and marks on the head B. Upon the angles through which the bar is tilted depends the height of its front edge. On this rests the hooked portion of the arm shown at the left in Fig. 1. The hook itself engages with the "kick-back" screw underneath, while the main spindle screw is engaged on the top by a threaded section on the under side of the arm. The recording and reproducing diaphragm frame also is supported on the edge of the bar A (Figs. 4 and 5). When this bar is so turned that its edge is at its lowest position, the arm at the left in Fig. 1 also is at its lowest position, and consequently its threaded position is in gear with the main spindle screw, imparting to the diaphragms a lateral movement. By slightly turning the head B the edge of the bar A is raised, raising with it the diaphragm frame, so as to have the stylus of whichever one may be in working position clear the wax cylinder and raising also the hooked arm, throwing it out of gear with the main spindle screw. The spindle and cylinder then revolve idly. By turning the head B further and raising the edge of the bar A still higher, the hook of the arm is brought into gear with the "kick-back" screw. This screw is of much coarser pitch than the other and revolves in the reverse direction, its office being, in reproducing, to bring the stylus on the reproducing diaphragm back to any desired point, as may be determined by the scale and index on the front of the machine, so as to repeat any particular part of the record. The arm may be thrown into or out of gear with the main screw by a treadle arrangement not shown, so that in transcribing the record on the wax cylinder by means of a typewriter, for example, the operator may stop the reproduction with his foot at any point, after having heard as much as he can conveniently remember, and proceed again when ready for the next sentence.

The position of the diaphragms can be readily adjusted by swinging the head in which they are mounted so as to bring either the recorder or the reproducer, as required, in its proper place in front of the wax cylinder. Suitable adjusting screws are, moreover, provided for securing a proper degree of pressure between the stylus of each diaphragm and the cylinder. The recording diaphragm, shown in its working position in our engraving, is furnished with a funnel-shaped mouthpiece, attached to a short, flexible tube, and in Fig. 2 is represented, with its accessories, on an enlarged scale. The diaphragm proper consists of a very thin plate of malleable glass and the stylus is attached to its center, being, in addition, pivotally connected to a spring arm fixed to the side of the diaphragm holder. Fitted slightly in advance of the stylus is a small knife, clearly shown in the illustration, which prepares a new, clean surface for the impression, cutting away all traces of previous records should there have been any on the wax. Of the reproducing diaphragm we give a detail view also, in Fig. 3. It consists of bolting silk thinly coated with shellac, and the needle or stylus is attached to its center through the intervention of a small piece of cork, being, besides, connected with the side of the diaphragm-holder, as in the case of

the recorder, by an arm, as shown. In reproducing musical notes the cork support just mentioned is replaced by rubber, this material having been found more satisfactory for the purpose because of its greater elasticity. The sound waves produced by the diaphragm are transmitted through a rubber tube, which is branched and provided at its extremities with ear pieces similar to those of a stethoscope. These are lightly placed in the ears of the operator. To make the necessity of this clear, we will explain that in the early form of phonograph distinctness and accuracy were sacrificed to volume of sound, while in the present instrument the reverse is the case; so that while

for action on the wax cylinder, or phonogram, as it is called. As this revolves the small knife previously mentioned, operating similarly to a lathe tool, prepares a smooth surface on the wax, and, in virtue of the arrangement adopted, is immediately followed by the recording stylus, which, under the influence of the vibrations of the glass diaphragm produced by the sound entering the mouthpiece, cuts into the wax and produces corresponding indentations.

The diaphragm with its stylus and knife is fed along by the screw cut on the main spindle, the "kick-back" screw being out of gear, and slowly traverses the wax cylinder. After the record is made, the carriage is again returned to the point of

Fig. 2.—Recording Diaphragm.

Fig. 3.—Reproducing Diaphragm.

Fig. 4.—End View of Disengaging Gear.

Fig. 5.—Elevation of Disengaging Gear.

SPEECH RECORDERS AND REPRODUCERS.

the reproduced sound is audible only to the operator equipped with the branched tube and ear pieces referred to, it is heard exactly as it was delivered into the mouthpiece against the recording diaphragm, all the variations of tone being faithfully given. So delicate is the reproduction that there is no difficulty in recognizing all the peculiarities of a familiar voice which may have been brought to act on the recorder. Motion for the instrument is supplied by a small electric motor in the box forming the base of the apparatus, connection being made with a battery. The governor only of the motor can be seen in Fig. 1, at the extreme left. The motion is transmitted to the main spindle and to the "kick-back" screw by a number of small belts and pulleys. From what we have thus far said it will perhaps have already been understood that in using the phonograph the recording diaphragm is first placed in its proper position

starting, the recording diaphragm is replaced by the reproducing diaphragm, and the carriage is again moved forward by the spindle screw as the cylinder revolves, causing the stylus of the reproducing diaphragm to traverse the path made by the recording needle. As the point of the curved wire attached to the diaphragm follows the indentations of the wax cylinder, the reproducing diaphragm is made to vibrate in a manner similar to that of the recording diaphragm, thereby faithfully reproducing the sounds uttered into the receiving mouthpiece.

A little thought will suggest a variety of uses for the phonograph. It may be employed for dictations and testimony in court, for reporting speeches, for the reproduction of vocal music, for teaching languages, for correspondence, &c. In dictating, one may talk as rapidly as one chooses, every word and syllable will be caught upon the delicate wax cylinder,

and afterward the latter may be transferred to the phonograph of a copyist, who may listen to the words of a phonogram and write out the manuscript. If any portion of the speech is not understood by the transcriber, it may be repeated as often as necessary. In a similar manner a compositor may set his type directly from the dictation of the machine, without the necessity of "copy," as it is now known. The wax cylinders are very light, and may readily be mailed in specially devised mailing cases. A number of records may be made on each cylinder owing to the thickness of the wax walls, the surface of which is cleared before every new series of impressions by the knife which travels in advance of the recording stylus. A performance of the apparatus which we had the pleasure of attending a few weeks ago was very striking and demonstrated in an entirely satisfactory manner, its capacity for accurate sound reproduction.

Similar in principle to the phonograph, as we have stated in the foregoing, is the

pared hardened wax and is very light. Not more than one tracing over its surface can be made, but its cheapness obviates the objection which might otherwise be raised to throwing it away and substituting a new one with a fresh surface. Below the cylinder is arranged a pan for receiving the fine shreds of wax which the recording stylus cuts from it, the number of grooves to the inch being about 160. At the right hand of the instrument is arranged a small rock shaft, provided with a cross arm and two keys working a clutch, by which the driving wheel is thrown into and out of connection with the gearing of the machine.

Upon the tube which incloses the feed-screw is placed a counter-weighted saddle, A, provided with a follower, which enters the slot of the tube and engages the feed-screw. The saddle carries a frame, in which is arranged a diaphragm of mica provided with a stylus, which engraves the record in the surface of the cylinder. The arrangement will be more readily understood by referring to Fig. 7, which repre-

recorder, a light spring, however, being used to press the stylus against the record cylinder. This spring is not necessary in the case of the recorder, since the weight of this with its attachments is much greater and amply sufficient to give a satisfactory impression on the wax.

In reproducing what has been recorded on the cylinder the recorder is replaced by the arrangement just described, and ear pieces of the branched tube are adjusted in the ears of the operator. The apparatus being put in motion and one of the small clutch keys shown on the right of the machine being pressed the reproduction of what is recorded on the wax cylinder commences, and when as many words as is desired are produced a slight pressure on the second key stops the cylinder, while the motion of the driving-wheel at the left continues, and the words reproduced are printed by the type-writer. The first key is then pressed again, and a few more words of the record produced, which are in turn printed by the type-writer, and so on throughout the record. The capacity

Fig. 6.—The Phonograph-Graphophone.

SPEECH RECORDING AND REPRODUCING APPARATUS.

phonograph-graphophone, invented a number of years later by Mr. Charles Sumner Tainter and rapidly developed by him into a practical and commercially valuable machine. Our engravings of it will show that, as compared with Mr. Edison's device, it is an exceedingly simple piece of apparatus. Fig. 6, which we prepared from a photograph, represents a general view. The frame of the machine consists of end pieces connected by longitudinal rods. In the top of the frame is journaled a fine screw inclosed in a slotted tube, the screw being driven through a train of spur-wheels from the main shaft journaled in the lower part of the left-hand end piece. The main shaft, besides carrying the gearing which moves the feed screw, is provided with a conical chuck. In the opposite end of the frame is journaled a spring-pressed spindle, which also carries a conical chuck of the same form and size as that on the main shaft. The cylinder upon which the sound is to be recorded is received between these chucks in much the same manner as the bobbin is placed in the bobbin winder of a sewing machine, the cylinder being revolved by frictional contact with the chuck on the main shaft. The cylinder consists of a spirally wound strip of paper coated with a specially pre-

sents a section through the recording diaphragm and clearly explains its construction. It will be noticed that a metal bridge extends across the face of the diaphragm, being attached to opposite sides of the diaphragm holder, and rests, at its middle, upon the record cylinder a little in advance of the stylus, thus supporting the weight of the diaphragm and its direct attachments. The depth to which the stylus penetrates the wax coating is in this way also regulated. Fig. 7 shows, further, that the saddle A is made up of two parts, hinged on top so that, together with the diaphragm holder, it can readily be removed. The recording action is much the same as in the phonograph, the diaphragm with its stylus being fed along the axis of the wax-coated cylinder by the screw B, while tracing its record on the wax. A separate and smaller reproducing diaphragm also is used, its construction being illustrated in Fig. 8. The reproducing stylus is pivoted, as shown, and transmits its vibrations to the diaphragm through a delicate rod. From the diaphragm holder is led a flexible tube, branched as in the case of the phonograph, and similarly provided with ear pieces, the whole being shown in Fig. 9. It is mounted on the tube inclosing the feed-screw B, like the

of a wax cylinder 6 inches long and 1½ inches in diameter when dictated to at the rate of 150 words per minute is about 700 words, this, however, depending upon the surface velocity.

The groove cut in the wax by the recording stylus is only $\frac{1}{160}$ inch wide and less than this depth, and 161 grooves to the inch are cut on the cylinder. The total length of the record on a 6-inch cylinder will therefore be about 250 feet. Cylinders 2, 4 and 6 inches long are used. The operation of changing them does not occupy more than a few seconds. Motion is derived from a small electric motor of special design, the invention of Dr. Orazio Lugo, of New York, worked by a battery. In Fig. 6 it is seen at the left toward the rear. Changes of speed may be effected by a switchboard alarm in front, at the right.

It is of no little interest to note that within the past half year phonograph-graphophones have been to some extent in practical every-day use, and have demonstrated their entire practicability and value as labor-saving devices. They were used in Washington in both houses of Congress for work in connection with reporting the proceedings and also by members for the dictation of their correspondence, &c. We

understand that many of the leading stenographers and lawyers at Washington are also using them, and find them of great help in their work. Thousands of record cylinders have been issued to supply these machines. Like the wax cylinders of the phonograph, they can be made to reproduce the records on them over and over again, and can be sent through the mails in specially devised boxes.

Both Mr. Edison's and Mr. Tainter's machines are controlled by the North

Mr. Tainter's design bids fair to be the more extensively employed, the character of its work being highly satisfactory for the purpose held mainly in view, and its construction throughout being simpler than that of the phonograph proper. Perhaps our readers have arrived at the same conclusion after having compared the general views Figs. 1 and 6. At the same time, we do not wish to be understood as desiring to disparage in any way Mr. Edison's apparatus. Its design and con-

cent atlas which the Geological Survey of that State have prepared and published, will be sold at the price of 25 cents each, either singly or in lots. This price is said to cover simply the cost of paper, printing and postage. Nothing finer in the way of topographical maps has been done by any of the State Surveys, and a real public service has been rendered in making these sheets available at a price so reasonable.

Steam Trials of the Italian Armored Lepanto.

A paper of special interest was presented at the last meeting of the British Institution of Naval Architects by Major Soliani, giving particulars of the steam trials of the Italian ironclad Lepanto. In these trials it was the first time that a power of 16,000 indicated horse-power had been developed on board an ironclad, giving her a speed of over 18 knots, and that a large number of locomotive boilers, in connection also with boilers of a different kind, had been worked together with complete success. The principal dimensions of the Lepanto are as follows:—

Length between perpendiculars	400 feet 6 inches.
Breadth	72 feet 9 inches.
Depth, molded	46 feet.
Mean draft, normal	28 feet 4 inches.
Area of midship section	1843 square feet.
Displacement	13,851 tons.

The ship is entirely built of steel, and has no sheathing on her bottom. There are six compartments of boilers, but only the two near the engine-rooms have marine oval boilers, four in each, and the remaining four compartments have locomotive boilers, four in each, making a total num-

Fig. 9.—Reproducing Diaphragm and Attachments in Position.

SPEECH RECORDERS AND REPRODUCERS.

American Phonograph Company, 160-164 Broadway, New York, and will be offered to the public at the same fixed rates per year or part of a year, this plan being adopted in preference to disposing of them by outright sale. Prospective users can thus have their choice of either of the machines uninfluenced by difference in cost, and the demand for either the one or the other will be, to some extent, a measure of its popularity and special adaptation to every-day requirements. On our part it would seem to us that, for general utility, the phonograph-graphophone of

struction are characteristic of the inventor's high attainments in the line of applied science, and we are inclined to think that for special uses, as in laboratory work, it may be found superior to the other. But its greater complication in its present shape would seem to be a drawback of some importance. Whether or not we are correct in this will be shown by future developments.

Prof. George H. Cook, of New Brunswick, the State Geologist of New Jersey, announces that the sheets of the magnifi-

ber of eight oval marine boilers and 16 locomotive boilers. The trials were to be made in accordance with the following programme, proposed by Messrs. John Penn & Sons, and accepted by the Ministry of Marine:—(1) A trial with only two oval boilers lighted, and the after engines only at work on the compound system, to ascertain the most economical steaming of the ship. (2) A trial with the eight oval boilers lighted, the four engines working compound. (3) Ditto, with the four engines working direct expansion. (4) A forced draft trial with

only the after set of engines and boilers at work, the engines working direct. (5) A forced draft trial with all eight oval boilers and eight locomotive boilers lighted, the four engines working direct. (6) A full-power forced draft trial or trials with all the engines and boilers at work, the engines working direct. This programme was not completely carried out, on account of the ship having been put into commission, which prevented the final 18,000 indicated horse-power trial being made. The trials were made along the eastern coast of the Gulf of Genoa, from Spezia to Genoa and back, the two runs being altogether of over 80 nautical miles. A portion of the forward run from Spezia to Genoa was taken in each trial to bring up the engines to the desired speed. After the rather discouraging experience with locomotive boilers working in sets on board some ships, as the Flavio Gioja of the royal Italian Navy and the Polyphemus of the Royal English Navy, some fear was entertained that similar troubles might be experienced with the Lepanto, in which the difficulty appeared to be still greater, considering the large number of boilers to be worked together in so many different separate compartments. But nothing of the kind happened. Everything went to prove the contrary. From the very beginning of the preliminary trials, which took place toward the end of last year, the locomotive boilers gave evidence of their good working, which went on increasing trial after trial, so as to be now an established fact. They never primed or gave any trouble whatever. The feeding was occasionally uncertain, but the fault was due to air that collected in the main feed-pipe. This imperfection was removed, and on the last two trials the feeding was quite satisfactory. After each one of the last three forced-draft trials the locomotive boilers had tubes leaking, but in small number, and not more, comparatively, than the oval boilers, which, even in this respect, did not behave better. Moreover, there were discrepancies between the different compartments of boilers, locomotive as well as oval, which shows that the management of the fires has a great deal to do with this matter. The engines worked very satisfactorily all through the trials, without the slightest hitch occurring in any part of the whole machinery. This circumstance helped, no doubt, to some extent the good performance of the boilers, which had never to be checked or hampered when in full swing. The power developed was 16,150 indicated horse-power, which gave a speed of 18.38 knots, the displacement of the vessel at the time being 14,860 tons, and the mean draft of water 30½ feet.

This association of locomotive with ordinary marine boilers as a cheap way of getting a portion of the power required in war ships has attracted attention for many years, and would, no doubt, have been more widely developed had it not been for the somewhat discouraging experience which the system gave rise to in the English navy.

A Chicago Elevated Project.—Another elevated railway scheme has been projected in Chicago. On the 29th ult. articles of incorporation were recorded in the office of the Secretary of State of the Chicago West Division Elevated Railroad Company, with a capital of \$10,000,000. It is intended to construct a railroad from a point in the south town of Chicago, north of Harrison street, west of Clark street, south of the river, to the western limits of the city, between Harrison and Lake streets, with four branches. The board of directors are Andrew Onderdonk, of New York; James Ross, of Sherbrook, Quebec; William D. Howard, John J. P.

Odell, James Deering, George S. Willits and William G. McCormick, of Chicago. Henry B. Robbins and Charles L. Brooke are incorporators, but not members of the board of directors. The scheme of the incorporators is a big one. The route proposed is sufficiently indicated above, but it is claimed that with the exact line of travel they have in view no fine residences or buildings will be interfered with. The incorporators will, at an early day, apply to the Council for an ordinance permitting them to go ahead with their scheme. It is the idea to cross the river by means of the bridge, and it is said that the inconvenience caused by the opening of the bridge during the navigable season will be but small, as the cars, running on their own unobstructed roadbed, can make good time when in motion. The fare is to be 5 cents.

Paper Belting.

Messrs. Crane Bros., of Westfield, Mass., have contributed to Mr. Cooper's book on "The Use of Belting," some interesting particulars relating to their paper driving belts. These are made from pure linen stock and can be made of any desired thickness, width and length. They are recommended only for straight and unshifted belts, and none are made less than 5 inches wide. They will not stretch nor change shape, and being made all in one piece, of even thickness, will run smoothly and straight. They are claimed to be equal in durability with leather, and equal also in strength. They adhere to the pulleys very closely and generate no electricity while running. Furthermore, they are quite flexible, and are claimed not to crack in passing over pulleys even as small as 6 inches in diameter. They are not affected by heat at ordinary temperatures, nor by dust or oil, but will not run in water. Compounds similar to those used for stuffing leather belts, or black lead, mixed with sperm oil, are said to be very good to apply to these belts when dry and slipping.

Electric Motive Power.

The electric motor business which was in a nascent state a few years ago is now developing at an even faster rate than the electric light business, though the amount of capital invested and the value of the plant is comparatively small. At the present time there are in use, in Boston for example, a large number of small motors for various purposes, furnishing in all about, roughly estimating, 500 horse-power. In New York City it is estimated that there is about 800 horse-power furnished by electric motors for various small industries. In Philadelphia there are a considerable number of electric motors in constant use, and the same is true of Buffalo, Cincinnati and Cleveland and their number is rapidly growing in all the large cities. In Chicago and Detroit the number is smaller and the use somewhat restricted owing to the efforts being made by municipal authorities to have the wires put underground and the consequent difficulty in making additions to the systems of overhead wires. The motors in use range in power from ¼ horse-power to 15 horse-power. A number of motors of ½ horse-power and others of 25 horse-power are also in use. In addition to the largest cities mentioned above, there is a considerable number of motors used in the smaller cities, such as Bangor, Me.; Lowell, Newburyport, Lynn and Springfield, Mass.; Providence, Pawtucket and Woonsocket, R. I., and other of the smaller cities of the East, and in St. Louis, Kansas City and other Western cities.

The question naturally arises as to the uses which these motors, furnishing as

they do small amounts of power, are put. In a general way it may be said that they are employed in all those industries and work which has formerly been done by a small amount of steam-power or by the gas engines and water-motors which have been quite extensively employed during the last few years. They are employed for driving air compressors, bookbinding machinery, bakers' machinery, blowers, cranes, carpenters' machinery, cash carriers, coffee mills, churns, drug mills, dumb waiters, dentists' lathes, drill presses, elevators, grindstones, hydraulic presses, hatters' machinery, ice-cream freezers, jewelers' lathes, knitting machines, lathe working machinery, laundry machinery, looms, paper box machinery, polishing machines, pile driving, printing presses, quotation transmitters, sewing machines, stamping machines, ventilating machines, washing machines, and a hundred other small uses.

Perhaps the most important use of motors at present is on elevators, printing presses and sewing machines, and in each line a large and increasing number are constantly being used. The increase in the many different outside uses is even faster. Wherever a moderate amount of power is needed the electric motor can supply it. The economy of the stationary electric motor over small steam and gas engines is claimed to be considerable. It is based upon the fact that large engines consume much less coal for the power furnished than do small engines.

In the transference of power through the dynamo and motor to the machinery about 20 or so per cent. is lost, but even with this it can be seen that large power may be produced at a central station and sold out to consumers cheaper than they could produce it by small engines. Incandescent electric light lighting companies can afford to sell the motor power cheap, as the motor business is of great and positive advantage to them in giving employment and earning capacity to their plant when it would otherwise be idle and profitless. This arises from the fact that most of the electric lighting is done at night, and the machinery and plant of the company is then employed, while during the day time it would be idle. The advantage to the consumer of electric power is found partly in the greater neatness, cleanliness and compactness of the motor as compared with engines, and from the fact that the motors require no attendance and the power can be turned on or off by a switch. The motors themselves as mechanical devices are claimed to be about 25 per cent. cheaper than engines. In most cases the motors are sold outright to the consumers, and the power is leased, but sometimes both motor and power are leased.

The Italian Admiralty have recently caused to be carried out a number of experiments with a view to testing the comparative merits of castor oil and of olive oil for lubricating purposes on board ship. From the results obtained they have given orders that henceforth all exposed parts of machinery are to be lubricated exclusively with castor oil, while mineral oils are to be used for cylinder and similar lubrication.

The Southern Railway and Steamship Association have issued in pamphlet form the new classification of freight for the use of all lines between Eastern and Western points and Southern points. This classification went into effect on the first of this month.

Evans & Howard, of St. Louis, Mo., manufacturers of fire-brick, gas retorts and sewer-pipe, have issued a new catalogue.

Peculiar Electrical Phenomena.

Some very singular electrical phenomena were observed on two very dry days at a printing office in Mayence, Germany, when the establishment seemed to be converted into a huge electrical battery. According to the *English Mechanic* electric sparks several centimeters long could be drawn with the fingers from all parts of the printing machinery, just as may be done from a charged electric machine. The action of the sparks became so pronounced that the layers-on and takers off (who, it should be remarked, in German printing offices are mostly young women) refused to work, as burning sparks were emitted every time the machines were touched with the hands. The electrical phenomena were most striking in the machines used for lithographic

The floors of the several machine rooms are also laid thick in asphalt, and the machinery is fixed direct to this flooring, so that it is likewise perfectly isolated. There are only a few iron columns having direct connection with the earth. On the morning of the day on which the startling phenomenon described was first observed, all the machine belts had been greased with a mixture consisting of resin and linseed oil, serving to increase the friction between the belts and the pulleys. As soon as the machinery was set in motion, each individual pulley was converted into an electric machine on a large scale, negative electricity being formed on the belt covered with resin, and positive electricity on the iron pulley. The stored electricity, of course, was immediately given off whenever one of the machines, which for the

ing only been issued November 22, 1887. Chester A. Hodge is the inventor of the present form of fencing made, also the owner of the machinery patents and builder of the machines, while the Larm Mfg. Company have the exclusive license for the use of the machinery and the manufacture of the fencing. At present four machines are in operation, but others are being built and six more will be running in time for the fall trade, to be followed by additional machines as fast as they can be completed.

The principles involved in the construction of the machine to make this fencing and to twist and spool it are very ingenious, and worthy of detailed description and illustration. We find, however, that the space at our command is too limited to admit of showing all the engrav-

MACHINE FOR MAKING SPUR WIRE FENCING, AT THE WORKS OF THE LARM MFG. CO., CHICAGO, ILL.

printing. A strong paper made of cellulose was being printed at the time, and the takers-off observed a slight crackling as the sheets, which adhered pretty closely to the oil-cloth covering of the cylinder, were being withdrawn. This crackling was finally developed into a loud explosion, accompanied by beautiful flashes from 10 to 12 centimeters (from 4 inches to 5 inches) in length. The discharges are stated to have been more effective the more quickly the sheets loaded with electricity were withdrawn. A small circular saw mounted about 4 inches from an iron column discharged at intervals of from 20 to 30 seconds, when driven, powerful electric sparks, accompanied by loud explosions, upon the column. These phenomena were observed for hours, and continued two days, when the printing office became free from electricity, and has remained so since.

The following explanation is given of the occurrence: The outer walls of the building in which the printing machinery is placed are separated from the surrounding soil by a thick layer of asphalt, serving to keep the moisture arising from the soil from penetrating the walls. In the present case the asphalt at the same time served to isolate the electricity generated within.

time being were changed into accumulators or secondary batteries, was "tapped."

Spur Wire Fencing Machine.

The Larm Mfg. Company, 84 and 86 Market street, Chicago, have succeeded, after a long series of experiments, in perfecting a machine to manufacture their "Harmless Spur Wire" fencing. This fencing is intended to compete with barb wire, to which it is claimed to be preferable, as it will turn cattle without severely pricking them. Instead of a rigid barb the Larm wire has a revolving spur, or toothed wheel, which works on a small piece of wire extending between the two strands. The engravings on the opposite page explain the construction. The spurs are 3, 4 or 6 inches apart, and consist of star-shaped pieces of steel so mounted on a cross wire as to revolve easily. Fig. 1 shows the twisted wire with the spurs thrown at right angles, and Fig. 2 shows the strands straight, both kinds being made by the company. This fencing was invented several years since, but the machinery for its manufacture has so recently been perfected that it is a comparatively new article in the market, the patents hav-

ings (about ten in number) that are necessary to a full understanding of the various operations, and must confine ourselves, therefore, to the use of a perspective view only. This, however, will give a fair idea of the general character of the design. We would refer those of our readers who are specially interested in the machine to the patent office records, the specification bearing the number 373,458.

The main idea is, of course, the revolving spur, which takes the place of a rigid barb, and thus overcomes an objection often made to the use of barb wire fencing. This spur, as mentioned above, is of star shape and is cut from steel hoops or strips, 1 inch wide and of No. 22 gauge. At first these stars were cut out by one machine and fastened in place by another, but now this work is all done on the single machine, which we illustrate. The steel hoop is coiled on a reel on top of the machine, as shown at the left. It is intermittently fed forward into position in front of a punch for punching the central hole in the star, this hole being punched before the star is cut out.

The punch and die for cutting out the star are located further along in the path of the star-strip, and operate to cut out the star at the end of the strip at the same

time and by the same movement that the hole is punched in the strip for a succeeding star. The star-punch and its operating rod or slide are made hollow, and a rod or pushing device reciprocating in it serves to push the star cut from the strip out of the female die and in front of or into the star-pocket of a reciprocating slide, by which the star is fed into position between the two fence wires and in front of the cross pivot wire. This star-feed slide operates in a vertical plane passing between the two fence wires. The

Spur Wheel Fence Wire.—Fig. 1.—Twisted Wire.

pivot wire is then pushed forward just under the fence wires and inserted through the hole in the star. A horizontally reciprocating slotted pivot-bending nose or horn having guide holes through which the two fence wires pass is then moved forward into position for supporting the pivot wire, while the ends of the pivot are bent over or around the slotted horn, and the fence wires, and at the same time a vertically reciprocating knife moves up and severs the pivot from the pivot-wire. This knife operates in conjunction with an opposing stationary knife. A pair of vertically reciprocating pivot benders or slides—one on each side of the fence wires and the horn, and one of which is integral with the movable knife before mentioned—move up (their motion being simply a continuation of the upward movement of the knife) and bend the two ends of the pivot up vertically or at right angles. A pair of horizontally reciprocating benders or slides then move inward toward each other over

Fig. 2.—Wire with Straight Strands.

the top of the lower or vertically moving reciprocating benders and bend the ends of the pivot down horizontally together. The slotted nose or horn then withdraws, and a clincher, occupying the space between the vertically moving benders and secured rigidly thereto, moves up and gives the finishing bend to the middle of the pivot. The benders and knives are then withdrawn and simultaneously the two fence wires and the star-strip are fed forward, and the star-feed slide also at the same time moves a second star into position between the fence wires.

The wire for the strands is fed from two reels in the rear, and the wire for the cross piece or pivot supporting the spur is fed from a reel at one side. The right-hand portion of our engraving represents the spooling and twisting machines, of which the operation, we think, is readily apparent.

Returning to the product of the machine, we note that the makers claim the wire to be harmless to stock, because it will not gash the skin, although it will prick sufficiently to warn animals away, and to be more plainly seen by stock than ordinary barb-wire fencing. The manufacturers assert, also, that the increasing demand from a widening circle of consumers supports these claims and demonstrates the satisfaction which the use of the wire is giving.

The new railroad freight tariff from Pittsburgh to all Pacific coast points was issued on Friday, the 24th ult., and will

go into effect on September 1 next. The rates have been advanced slightly. In some cases the advance is on the commodity and others on the rate. The new rates from Pittsburgh, Buffalo, New York and common points East, and West of Atlantic seaboard common points will be: First class, \$4; second, \$3.50; third, \$2.80; fourth, \$2.20. Class A, \$1.95; B, \$1.75; C, \$1.40; D, \$1.25; E, \$1.15. The rates on iron will be: Carloads, \$1; less than carloads, \$1.20. This rate is special. The rate formerly was 99 cents and \$1.08.

Labor at the Pencoyd Works.

Two Philadelphia newspapers, the *Record* and the *Times*, published charges that the A. & P. Roberts Company, of the Pencoyd Iron Works, near Philadelphia, employed imported Hungarian and Polish labor, and the employees were huddled together in "dirty" houses, and that the men were kept poor by means of a "pluck-me" store. In reply thereto the firm have prepared a statement, from which we quote the following:

The Pencoyd Iron Works at present employ about 1400 men. Of this number 132 are Hungarians and Poles. The appended table gives their number, wages per day and character of the work performed:

No. of Men.	Wages per day.	Occupation.
37.....	\$1.10.....	Laborer.
1.....	1.15.....	Laborer.
1.....	1.20.....	Laborer.
62.....	1.25.....	Laborer.
20.....	1.35.....	Laborer.
2.....	1.40.....	Shears.
2.....	1.50.....	Bridge shop.
2.....	1.55.....	Bridge shop.
4.....	1.80.....	Mill.
1.....	2.50.....	Mason.
1.....	2.75.....	Mason.
1.....	3.00.....	Mill.

132

The men paid \$1.10 per day perform a class of shifting labor which is necessary around every works of this size and character. It is not steady work, but embraces such occupations as loading ashes, unloading cars, &c. The work being irregular in its character varies from day to day and has always been supplied from men who have been in the country apparently only a short time and have not, as yet, been able to find more permanent occupation.

We positively deny ever having imported any cheap contract labor, and there is no Hungarian or Pole at present in our works who has not applied for work of his own accord and has been hired entirely upon the question of his fitness for the intended occupation, with no more reference to his nationality than to the names and residences of his grandparents.

There are at present 49 tenement houses belonging to the works, occupied as follows:

No.	Nationality.	Average No. each house, including children.
13	German.....	6.0
4	English.....	5.7
13	American.....	5.0
14	Irish.....	6.4
2	Welsh.....	6.0
3	Polish.....	3.3

49

The four houses referred to by the *Record* as "Noah's Ark," and containing "about half a hundred men," are leased to four German families. Each house contains three sleeping rooms, with beds. No room has more than two adults. Each house has four boarders only. By an examination of the table it will be seen that the highest percentage of inmates are in the houses occupied by persons of Irish nationality, while the lowest percentage are in the houses occupied by Poles.

Referring to the statements made by the *Record* in regard to a company store, we have to say that the store spoken of is a

small one, started some years ago for the purpose of supplying necessary goods to people living on the west side of the Schuylkill River, who were obliged to cross the river daily for the necessary articles of food. There is no compulsion whatever used in the matter, and many of the customers are not from among our own people. The sales average \$800 per week, while our pay-roll is \$15,000 per week, and, except in a small number of cases, mostly made up of single men, all accounts are paid in cash by the customers.

The steamship agency we are accused of holding for the purpose of importing emigrants has been for many years in the hands of our paymaster for the purpose of sending money to families and friends of the employees of the works who may not be in this country, and has sold during the last 20 months the following tickets: For 6 men, 15 women, 22 children and 1 excursion ticket.

English Armor Plate Trials.—Recent English armor plate trials have given some noteworthy results according to the *London Engineer*. The plate tested was manufactured by Messrs. Cammell & Co., and was forged under their new hydraulic press, which is capable of exerting a pressure of 5000 tons. In its way it was quite as remarkable as the compound plate which broke up all the shot, both steel and chilled, directed against it. It measured 8 feet x 6 feet, and was of a thickness of 10 inches. The composition of the steel is a trade secret, but its flexibility was such that it passed through the ordeal under fire without splintering or falling in pieces like the Creusot plates. Five shots were discharged against it from a 6-inch gun at 30 feet range. Two were chilled Palliser projectiles, while the remainder were Holtzer solid forged steel shot. The charge was 42 pounds, the muzzle velocity 1920 feet per second, and the muzzle energy 2556 foot-tons. The chilled shot were entirely broken up, but the indents in the plates were deeper than in the case of compound armor. The steel projectiles were pointed diagonally across the face of the plate, from the bottom right corner to the top left corner, the difference in the inclination of arm having an important effect upon the ballistic value of the various rounds. The first shot fired at the normal penetrated the plate, the base being about 5 inches below the surface. The second shot, fired at an inclination of 8°, buried itself in the target with the exception of 2½ inches; while the third and last round, fired at a deviation of 16° from the normal, protruded about 7 inches from the face. None of these projectiles were broken up, but plugged themselves into the plate, where they remained firmly fixed. The armor plate itself at the end of the experiment, though cracked in places, retained its position on the backing, and was in a fair state of preservation. Though the shot discharged point-blank at the target penetrated the plate, none succeeded in getting through, but were arrested and held firmly in the grip of the metal.

The Jersey City Board of Works received bids for purifying the present water supplies and for a new supply outright. The bids for purifying included the erection of a plant capable of aerating 24,000,000 gallons daily, as follows: Jewell Water Company, of Chicago, \$263,975; Philadelphia Water Purifying Company, \$210,000; United States Sanitary Filter Company, of New York, \$250,000; Hagerman & Olyphant Filter Company, \$275,000; American Filter Company, of Chicago, \$250,000; Hyatt Pure Water Company, \$350,000. The proposals for the new water supply were for the delivery at the

Belleville reservoir of 20,000,000 gallons daily. The Montclair Water Company, which proposes to obtain its supplies from the upper Passaic, bid \$40 per 1,000,000 gallons, and the Lehigh Valley Railroad, which proposes to use the Morris Canal to bring water from Lake Hopatcong to Jersey City, \$42 per 1,000,000 gallons. The Commissioners decided to call a public meeting for September 8, to discuss the entire question.

Improved Screw Gang Saw.

The Merriman screw gang for sawing stone, one modification of which is here shown, has been in use for a number of years and has demonstrated itself to be one of the best stone sawing machines made. Its superiority is largely due to the fact that the frame which carries the saws is fed down to the stone by a positive feed which is automatic and adjustable to stone of different degrees of hardness, and at the same time the frame is held firmly down while in action, so that the pressure of the

The "Carload" Lot Cases.

A "brief" has just been filed with the Interstate Commerce Commission which will undoubtedly prove of interest to the entire commercial community. The "brief" appears in what have been popularly denominated the "carload lot cases," three in number, which were brought on behalf of a committee of the New York Board of Trade and Transportation, by Thomas L. Greene, as manager of the Merchants' Freight Bureau of New York, on behalf of some hundreds of retail merchants in the interior States, and by Francis H. Leggett & Co., of New York, against the Trunk Line railroads. They were tried before the Commission in January last, after a mass of evidence had been taken at Mr. Fink's office in this city by deposition, and have just been submitted for decision. The plaintiffs' counsel are Simon Sterne and Charles F. Beach, Jr., of New York, Mr. Thomas L. Greene appearing in person. The counsel

and conditions attending the transportation to warrant such increase. The testimony shows that these great differences between carloads and less than carloads were imposed by the railroads for two reasons: one was to give back to the local roads their old local rates. It is a well-known fact that grocery staples were carried from station to station before the passage of the Interstate Commerce Act by the railroads at rates which were grossly out of proportion to the charges made for the transportation of like articles between competitive points. This gross discrimination against the small towns and villages was one of the main reasons for the passage of the Interstate Commerce Act, and it is shown that the present classification and tariff was arranged in this manner to give back to the local roads under another form the same local rates which they had before the passage of the act and which the act forbids.

It is also of interest in this connection to notice that before the 1st of April, 1887, twenty thousand pounds constituted the

IMPROVED SCREW GANG SAW, BUILT BY THE LINCOLN IRON WORKS, RUTLAND, VT.

saws upon the stone is uniform. This construction also counteracts the thrusting action of the pitman upon the saw frame, which becomes excessive when the saws are either at the top or bottom of a block, causing a jumping motion of the frame and saws, largely neutralizing their cutting action and destroying the machine itself.

The machine as shown is made by the Lincoln Iron Works, of Rutland, Vt., and has a saw frame of iron, the sides being made of heavy wrought-iron tubing and the heads or ends of 12-inch channel bars, two for each head. These are secured to each other by a strong casting, and when the saws are in it the frame is absolutely rigid. The crankshaft is made of hammered iron, and is 4½ inches in diameter. The bearing on the crank end is forged larger, being 6½ inches, and the pillow block for this end is made adjustable. The crank-wheel, which is keyed on this enlarged part, is made with a counter weight which balances, or nearly so, the weight of the pitman and its attachments. The wrist-pin is cast on to the crank-wheel and is made of ample size to prevent cutting and wear. The increase of speed and the addition of automatic feeding devices have made a great difference in the amount of cutting one of these machines will do. Some of the later machines have cut as much as 8 inches per hour, actual depth of cut, in Bedford, Ind., limestone, and as high as from 3 to 4 inches per hour in granite.

for the railways include such well-known lawyers as Judge Logan, for the Pennsylvania; Frank Loomis, for the New York Central; James A. Buchanan, for the Erie, and John K. Cowen, for the Baltimore and Ohio Railroad. The review of testimony and "brief" summary, as furnished to the press by complainants' counsel, reads substantially as follows: The matter complained of is the imposition of excessively high rates upon less than carload shipments from the East to the West on grocery staples and various articles of household and common use, as compared with very much lower rates for the carload quantities on the same articles. These discriminations were put by the railroad people into their West-bound tariffs since April 1, 1887, so that whereas ten years ago the classification from the seaboard West-bound had only 30 articles which took a less rate in carloads than for small quantities, the number now having such differences for quantity exceed 900 articles.

To arrange for the new state of things which was necessitated by the passage of the Interstate Commerce law, the railroads advanced the rates for small quantities of these staples on the 1st of April, 1887, to figures higher than for any time during the previous ten years, so that at the present time these rates for small quantities exceed the rate on the same articles when in carloads, in some instances, by more than 100 per cent., and this, too, without any change in the circumstances

capacity of a car and was considered a carload quantity, but since that time no shipment for less than 24,000 pounds can, according to the rule imposed by the new tariffs, have the reduced rate, and as the carload is an increasing quantity really meaning any specified tonnage upon which the railroads may wish to insist, and as the newer cars have a capacity of 40,000, 50,000, and sometimes 60,000 pounds, the tendency is to make the arbitrary limit of a carload increasingly large, so that next year it may be advanced by the railroads from 24,000 pounds to twice that quantity, as it has just been advanced from 20,000 to 24,000 pounds, and may possibly be made ultimately as large as what constituted a trainload in the early history of railroading.

The railroad piers and stations in New York and all large cities receive large quantities of merchandise which individually are less than 24,000 pounds, but which bunched and loaded into cars to their full capacity make up full carloads, so that without any additional expense the railroad people get from such cars so loaded to their full capacity, on which the highest possible less than carload rate is charged, three times the revenue which they receive from carloads loaded with one kind of freight which go at carload rates. This is a gross wrong to the small shippers whose freight is so bunched and loaded, and who are, therefore, equitably entitled to the benefit of any such economies in transportation.

The testimony of the witnesses for the railroads in these cases fails to justify these differences, the witnesses, however, disagreeing among themselves as to the reason of such differences. The theory of difference in the cost of service was one of the main reasons advanced by the witnesses for the railroads in defense of the present rates, but it was shown that this cost bears no relation to the difference in the rate, and indeed in this regard the whole tariff seemed to be arranged by "rule of thumb," no definite principle being discovered.

It was shown in the testimony that the difference in the rate of freight charges in the case of most of these articles equals or exceeds the jobber's net profit, so that such a freight rate practically prohibits sales of these goods at the seaboard and shipments West-bound in the smaller quantities.

The result of the present classification is, therefore, that the retail grocer throughout the country is restricted in his buying to his own home market; the lack of competition resulting therefrom increases the prices he has to pay and decreases the quality of his goods, so that the consumers, who are the customers of the retail grocer, and the majority of whom are included in what is known as the laboring class, must, if the present state of things becomes permanent, pay higher prices for poorer goods.

The Tube and Pipe Makers.

Their Argument Before the Senate Finance Committee.

On the 24th ult. William J. Curtis, of the law firm of Sullivan & Cromwell, appeared before the Finance Committee of the Senate as the representative of the following tube and pipe manufacturers of the United States:

Haxton Steam Heater Company, Kewanee, Ill.; Crane Bros. Mfg. Company, Chicago, Ill.; A. M. Byers & Co., Pittsburgh, Pa.; Chester Pipe and Tube Company, Chester, Pa.; Continental Tube Works, Limited, Pittsburgh, Pa.; Conshohocken Tube Company, Conshohocken, Pa.; the Allison Mfg. Company, Philadelphia, Pa.; James Hooven & Sons, Norristown, Pa.; Morris Tasker & Co. (Incorporated), Philadelphia, Pa.; Pennsylvania Tube Works, Pittsburgh, Pa.; American Tube and Iron Company, Middletown, Pa.; Pittsburgh Tube Company, Pittsburgh, Pa.; Reading Iron Works, Philadelphia, Pa.; Spang, Chalfant & Co., Pittsburgh, Pa.; Syracuse Tube Company, Syracuse, N. Y.; Duquesne Tube Company, Pittsburgh, Pa.; Oil City Tube Company, Oil City, Pa.; Riverside Iron Works, Wheeling, W. Va.; Curtis & Co., Syracuse, N. Y.; National Tube Works, McKeesport, Pa.

He presented the following argument, the petition having been prepared under the supervision of Mr. Converse, of the National Tube Works:

To the honorable the members of the Senate Committee on Finance: GENTLEMEN.—The manufacturers of wrought iron and steel tubes and pipes in the United States beg leave to request a revision of the tariff affecting their manufactures as established by the Mills bill, and to ask also for a new classification of their products. The proposed change will read as follows:

I. Plain-end boiler tubes, flues or stays, of wrought iron or steel, of diameters of (outside measurement) $2\frac{1}{2}$ inches or less, 8 cents per pound.

II. Plain-end boiler tubes or flues or stays, of wrought iron or steel, of diameters of (outside measurement) over $2\frac{1}{2}$ inches, $2\frac{1}{2}$ cents per pound.

III. Gas, water and steam tubes and all other classes and kinds of wrought iron or

steel tubular goods having threaded, flanged or socketed ends (permanent or detached) 2 cents per pound.

IV. All tubular goods having plain ends—i. e., no threads, screws, sockets or flanges shall be included in Classes I and II.

We shall justify the proposed duties by calling your attention briefly to the growth, magnitude and importance of the industry we represent.

Ten years ago there were only eight mills manufacturing wrought-iron pipe in the United States, and these were located in the States of New Jersey, Pennsylvania and Illinois. Under the fostering care of the American system of protection the industry has increased in the last 10 years from eight mills to thirty, scattered through eight States. The annual value of the product in 1878 was from \$15,000,000 to \$20,000,000, and from 6000 to 8000 hands (men and boys) were employed. To-day the value of the output is from \$30,000,000 to \$40,000,000, and the number of laborers engaged from 12,000 to 16,000. It will therefore be seen that there has been a growth of 100 per cent. in value of product during the last decade, due, as we claim, to the protection afforded, and this without injury to the consumer, as we shall hereafter show.

During this period there has been a growing demand for wrought-iron and steel tubes and pipes, caused by the growth of the country, the development of other manufacturing interests, and the creation and discovery of new enterprises, notably natural gas supply companies and oil wells. This active demand stimulated the manufacturers to increase their capacity, and while new mills have been erected they do not alone indicate the growth caused by extension and enlargement of old plants. At the present time the capacity of working mills is about one-half the whole amount, 15 mills being idle, having been closed because of too active competition, the business proving for the time being unprofitable. Since January, 1888, there have been two failures, besides the suspension of operations of three other large concerns. Even now, with 15 mills running, the capacity to produce is from 20 per cent. to 40 per cent. in excess of the present demand. This industry is very wide-spread in its usefulness, as the output of the mills enters into various manufactures and trades, such as locomotives and steam boilers of all kinds, gas and water mains, buildings and nearly all classes of construction work. The amount of capital invested may fairly be estimated at not less than \$15,000,000, involving a payment to laborers of not less than \$4,500,000 to \$6,100,000 annually. This capital is, of course, subject to all the influences of like investments, such as wear and tear, fluctuation in prices of raw material, and active home competition, and was embarked in the various enterprises in expectation of all these influences and conditions. The ordinary risks of business have been anticipated, and the manufacturers have confidently relied upon a reasonably stable governmental tariff policy, but they have not expected to be menaced by the dangers of foreign competition induced by a too radical change of the tariff.

The existing tariff has furnished substantial protection from foreign competition, the home demand being almost entirely supplied by home manufacturers. The class of goods in question are manufactured outside of this country, principally in Great Britain and Germany, which countries have an advantage of nearly 100 per cent. in cost of material and about 40 per cent. in cost of labor. This statement is very conservative, as it is based upon a comparison with the cost of labor and materials in Great Britain, whereas in Germany labor and materials are even lower than in Great Britain. Persons well informed in

the trade are bold enough to affirm that the time is not far distant when English manufacturers will be seeking protection against German importations.

Of the 16,000 laborers employed in this country about 75 per cent. can be classed as skilled labor. Many of the more skillful have been trained in their work from boyhood, and have acquired sufficient means to obtain comfortable homes. They are unfitted for any other trade or employment, and if, by reason of any diminution in the demand they were forced to become idle, great and serious results would flow to them and bring disaster and ruin to many happy and contented homes—a condition that could not be cured by seeking other occupations for which they are unfitted and unable to prepare themselves owing to want of skill and adaptability and local and family ties.

Notwithstanding the protection received, the result has not been injurious to the consumer. This fact is conclusively proved by the fluctuation in prices of pipes and tubes, which have varied according to the natural influences of trade. The excess of capacity over the demand, and the absence of any combination, pool or trust have stimulated manufacturers to excel each other in the cheapness of their goods and have caused a healthy rivalry in business, the benefit of which has been enjoyed by the consumer. This condition is likely to continue, as any increased demand would stimulate production, cause the silent mills to renew work and thus counteract the rise in prices.

Another and most important result of the protection hitherto enjoyed has been in the superior class of goods made in this country. The character of goods made in Great Britain, where most foreign pipes and tubes are produced, is inferior to our own, both in their crude and manufactured state. While the English make three distinct grades of goods for gas, water and steam purposes, grading the thickness, quality and perfection of workmanship according to the tests to which these goods are to be subjected in actual use, we manufacture one class, suitable for gas, steam and water; and, while it is true that our factor of safety, where goods are used for gas, is very much larger than necessity calls for, the consumer and the public derive the advantage of this precaution. It would, therefore, result in great injury to the public to mix the different classes of goods, either through the designs of dishonest merchants or the carelessness of purchasers. A change of system so long and so favorably established and known would bring chaos and confusion to the trade, as well as loss and danger to consumers. The English and Germans are noted for cheapness and the Americans for quality. It may be said that the superior quality of our pipes and tubes would afford some protection to our manufacturers and keep their rivals out of this market; but it is a well-known fact that advantage in price is a greater danger than advantage in quality is a protection. It will, therefore, be seen that protection benefits instead of injuring the consuming in quality.

Any demoralization of the pipe and tube trade in this country will react upon other industries. With us, as with almost all other trades and arts, there are many supplying materials, &c., with which we work. One of the mills represented by us (the National Tube Works Company) itself manufactures from 50,000 to 60,000 tons of iron and steel by three or four different processes, all of which is consumed in its own mill. This company employs in this branch of its business alone 2000 workmen. It also purchases as much more material from other rolling mills and forges. While all rolling mills and forges are not dependent upon the trade we represent

for their business, the strips of steel and iron used in pipe-making are of special form and size, and rolling mills are now engaged making this specialty alone, producing at least 500,000 tons annually, and employing about 22,000 workmen. We might follow the chain further back and consider the number of steel ingots, blooms, and the amount of pig-iron necessary to supply these rolling mills, but our purpose will have been accomplished if we have directed your attention to the intimate relation one branch of trade bears to another, and to the great injury that would result from crippling the manufacture of one line of goods, which in itself, as compared with the great total of iron and steel production, is comparatively insignificant; but when considered in the light of its effect upon trade and upon business, supplies the difference between success and failure. These interests are all kindred, and what affects one is sure to affect the other. A serious disturbance of the present relation must, therefore, injure many workmen and impair many millions of capital. The closing of all the pipe and tube mills and kindred rolling mills in this country, could such a contingency arise, would cause at least \$100,000,000 of capital and 100,000 workmen to lie dormant and be idle.

The proposed tariff and classification differ from those in the existing law, those in the bill now before you, and your own suggestions as they have been conveyed to us. A frank consideration of the necessities of the case has warranted a revision and a substantial reduction provided the classification can also be adopted. The language used is justified by experience, as the present tariff can be, and, as we believe, is, being evaded by importers. For the purposes of ready comparison we copy the various provisions:

Present Tariff.—"Boiler tubes, or flues or stays of wrought iron or steel, 3 cents per pound.

"Other wrought iron or steel tubes or pipes, 2½ cents per pound."

Mills Bill.—"Boiler tubes or other tubes or flues or stays of wrought iron or steel, 1½ cents per pound." (Page 18, lines 247, 248.)

Proposed Senate Bill.—"Boiler tubes or other tubes or flues or stays of wrought iron or steel, 2½ cents per pound."

Our Classification.—I. Plain-end boiler tubes, flues or stays of wrought iron or steel, of diameters of (outside measurement) 2½ inches or less, 3 cents per pound.

II. Plain-end boiler tubes or flues or stays of wrought iron or steel, of diameters of (outside measurement) over 2½ inches, 2½ cents per pound.

III. Gas, water and steam tubes and all other classes and kinds of wrought iron or steel tubular goods having threaded, flanged or socketed ends (permanent or detached), 2 cents per pound.

IV. All tubular goods having plain ends, i. e., no threads, screws, sockets or flanges shall be included in Classes I and II.

It will be readily seen that the recommendation we make has the merit of clearness and simplicity, although somewhat longer than any of the others.

By a curious coincidence the word "pipes" is entirely omitted from the Mills bill, and also from the first section of the existing law.

So quick is the foreign competitor to catch at these significant distinctions that German tubes have been imported and invoiced as pipes, thereby obtaining the advantage of the lower duty, and securing a market for their goods at prices against which it is impossible for our clients to compete.

We have presented these general views for your earnest consideration, without burdening you with a mass of statistics and figures to justify our facts; but should

you crave the confirmation we are prepared to give, and your patience and strength will permit you to peruse them, we will gladly furnish the data collected for the purpose of enabling us to present the views herein expressed. They warrant us in laying down the following propositions:

I. The system of protection in practice during the last ten years has stimulated the growth of the manufacture of wrought iron and steel pipes and tubes.

II. It has protected the home industry without injury to the consumer.

III. Home competition is now so active as to prevent unnatural and artificial prices and exorbitant profits.

IV. The addition of foreign competition would result in disaster to our home mills.

V. We cannot compete with foreign manufacturers.

(a) They have 100 per cent. advantage in the cost of material.

(b) They have at least 45 per cent. advantage in cost of labor.

(c) Their goods are inferior in quality.

VI. The present investments in manufacture were made on the faith of protection and an expectation of reasonable stability of the tariff.

VII. The home consumer has been benefited by a natural fluctuation in prices, and a superior standard of goods.

VIII. A radical change in the tariff would imperil the capital invested and injure the laborers, who must, of necessity, prosper or suffer according to the condition of trade.

These considerations warrant the appeal we submit, and in view of the reasonable concessions made in our recommendation, we confidently hope you will be justified in reporting them in the bill to be proposed by you to the Senate.

Grate Areas for Boilers.

The *Locomotive* directs attention to the fact that one of the greatest mistakes that can be made in designing boilers, and the one that is most frequently made of any, consists in putting in a grate too large for the heating surface of the boiler, so that, with a proper rate of combustion of the fuel, an undue proportion of the heat developed passes off through the chimney, the heating surface of the boiler being insufficient to permit its transmission to the water. This mistake has been so long and so universally made, and boiler owners have so often had to run slow fires under their boilers to save themselves from bankruptcy, that it has given rise to the saying, "Slow combustion is necessary for economy." This saying is considered an axiom, and is regarded with great veneration by many, when the fact is, if the truth must be told, it has been brought about by the wastefulness entailed by boiler plants proportioned badly by ignorant boiler-makers and ignorant engineers. Direct experiments have been made to settle the question. The grate under a certain boiler was tried at different sizes with the follow result:

With grate 6 feet long ratio of grate to heating surface was 1 to 24.4.

With grate 4 feet long ratio of grate to heating surface was 36."

The use of the smaller grate gave, with different fuels and all the various methods of firing, an average economy 9 per cent. above the larger one, and when compared by burning the same amount of coal per hour on each, 12 per cent. greater rapidity of evaporation and economy were obtained with the smaller grate.

The *Ironmonger* prints the following: "An example of the serious manner in which trade is hampered by high railway rates has just come under our notice, and may be mentioned in order to encourage

the movement which is in progress for securing improved water communication for certain of our inland districts. A firm in mid-England purchased in the United States 600 tons of American charcoal pig iron. That iron was produced at Elk Rapids, Mich., a place, as most of our readers are aware, several hundred miles west of New York. The iron was shipped to Liverpool at a freight rate of under 16/ per ton, including all dock and other dues in the United States. The distance thus covered was about 3800 miles, so that the freight charge was extremely favorable. The dock dues in Liverpool and the railway rate from Liverpool to the consignee's sidings, a distance of 80 miles, amounted to 11/ per ton, a charge which compares most unfavorably with the ocean freight."

The World's Wheat Supply.

According to a recent review in *Bradstreet's*, the world as a whole has wheat sufficient for the world's consumption in 1888-9, but on a higher plane of prices. The price may become speculative, may be carried too high, higher than the situation warrants, in which cases there will be reactions. From the information in hand it appears true that wheat supplies will be so much smaller than usual and that the reserves will be so much depleted as to warrant an advance in values. The higher freights ruling will be a factor in bringing about this result.

Europe's Wheat Requirements and Supplies.

	Bushels.
United Kingdom.....	155,000,000
France, probably.....	75,000,000
Spain and Portugal.....	10,000,000
Switzerland.....	10,000,000
Italy.....	20,000,000
Belgium.....	16,000,000
Holland.....	7,000,000
Sweden.....	1,000,000
Germany.....	18,000,006
Greece.....	5,000,000

The total will reach.....331,000,000

Russia will probably supply.....	90,000,000
Austria-Hungary.....	12,000,000
Egypt.....	3,000,000
Algeria.....	2,000,000
Denmark.....	30,000,000
Turkey, Roumania, &c.....	5,000,000
Persia.....	90,000,000
United States.....	4,000,000
Chili.....	8,000,000
Argentine Republic.....	10,000,000
British North America.....	18,000,000
Australia.....	35,000,000
British India.....	305,000,000

Apparent deficiency.....26,000,000

But these estimates, both supplies and requirements, may need considerable modification. Any very considerable advance in the price would necessarily diminish consumption, as greater economy would be exercised, which would leave no real deficiency. It may be safely stated that there will be no wheat famine in the world during 1888-89.

The first full cargo of iron ever shipped north, says the *Atlanta Constitution*, was carried out last Thursday from Savannah, loaded for Philadelphia, on the new freight steamship City of Birmingham, of the Ocean Steamship Line. The iron came from Birmingham, via the Central Railroad of Georgia, and indicates the growth of the new industry in the South. The cargo consisted of 121 car loads, or 2079 tons of pig metal, and the steamer went out drawing 16 feet 8 inches mean draft. After discharging her cargo at Philadelphia the Birmingham will go to New York and load railroad iron for Savannah. While large quantities of pig iron have been going East via the Central Railroad and its ocean steamers from Savannah, this is the first full cargo that has ever gone from any Southern port.

THE WEEK.

The President has designated Lieutenant Jacob J. Hunker, United States Navy, as Supervisor of the Harbor of New York. He is to act under the direction of the Secretary of War in enforcing the provisions of the act to prevent obstruction and injurious deposits within the harbor and adjacent waters of New York City by dumping or otherwise, and he is to detect all offenders against this act. He is to direct the patrol boats and other means to detect and bring to punishment offenders against the provisions of the act.

Chairman Blanchard, of the Central Traffic Association at Chicago, pronounces the new Pacific Coast rates, which took effect September 1, unfair, and he advises shippers in the transcontinental trade to appeal to the Interstate law. Mr. Blanchard stated that he would not accept them, neither would the Eastern trunk lines. He didn't think the California roads had any right to make a lower rate from New York to San Francisco than from an intermediate point like Pittsburgh. These lines fall back on the winter clause of the Interstate law, and claim that under this act they are justified in making these unfair rates. As it is now, the Pittsburgh iron manufacturer, in shipping to the Pacific Coast, will find it cheaper by far to send his iron to New York and have it returned from there. The California lines say they will not withdraw the tariff, and Mr. Blanchard said the only way to settle the difficulty is to appeal to the Interstate Commission. He also thought that the Interstate commissioners should have more authority. The law is merely advisory at present, and the railroads cannot be forced to obey it. He believed certain changes should be made which would give the commission the authority to coerce the roads into obeying the letter and injunctions of the laws laid down by the Senate. He said further that the business done by the roads so far this year does not compare with the traffic handled in 1887.

The New York Corporation Council pronounces the law void which was passed by the last Legislature creating an office for the weighing of coal, being in violation of article 5 section 8 of the Constitution, which says: "All offices for the weighing * * * any commodity whatever are hereby abolished, and no such offices shall hereafter be created by law."

An English resident of Ecuador is about to establish a fortnightly steamship service, under Colombian colors, between Chilean ports and Panama, and the United States Consul-General at Panama believes it will be successful.

Three eminent Chinese engineers at New Orleans are examining the jetty system and are to decide whether it can be used advantageously in deeping the mouths of the Yellow River.

Charles H. Lichman resigned the general secretaryship of the Knights of Labor.

Jacob Souder, a prominent coal operator at Pottsville, and for many years sales agent of the Reading Company, was killed between the bumpers of the cars at Crystal Colliery on Friday last.

The contract for putting the city Fire Department wires underground was awarded to the Standard Underground Cable Company. The contract calls for an expenditure of \$47,717.25.

The advocates of the proposed East River tunnel are urgently pushing their scheme before the New York Board of Aldermen. The tunnel under the city streets would run through Thirty-eighth street from the East to the North River, with lateral branches connecting with the

New York Central and Hudson River Railroads. Everett P. Wheeler, representing the Long Island Railroad Company, said the tunnel will be 5 miles long, and will pay to the city in taxes \$50,000 a year. There will be an opening to the tunnel at every block, and access will be had to it by a system of commodious elevators. It is not proposed to run locomotives in the tunnel, but to use either electricity or cable as a motive power.

It is reported that the importers of tropical fruit have organized a trust in New Orleans. Six houses are in the combination, representing a total capital of \$10,000,000. It is said \$6,000,000 have been advanced by London parties to build railroads in Central America and concentrate the trade at selected ports.

Jute bagging as a covering for cotton bales has been considered indispensable, but a combination of the manufacturers to advance the price is resolutely resisted by cotton planters, and to such an extent that deliveries at shipping ports may be seriously delayed. The question excites deep interest on the New York Exchange, the legality of any substitute for jute bagging under the regular delivery contract being questioned. In New Orleans, according to one of the local papers, "the suggestion to use cotton cloth as a substitute for jute and hemp in covering bales of cotton appears eminently practical and wise from every point of view," but in some instances difficulty is encountered in effecting fire insurance.

The Contract Labor Committee authorized by Congress will resume its investigations about November 1, but the testimony already taken is voluminous, and, according to Representative Ford, has convinced the committee that something positive must be done. The laws relating to contract labor have been violated to an alarming extent because of the lack of machinery to enforce them. Italy is flooded with steamship agents who make false statements to induce emigration. One of the facts brought to light incidentally was that naturalization papers are being issued fraudulently to an alarming extent. It is very easy to get out these papers under our law; any one having access to the seal of a court can get them out and sell them. Another fact developed was that the New England fishermen are aliens to the extent of 75 per cent. As to the remedy, the committee have not agreed upon the form it shall take.

The annual report of the Commissioner of Pensions shows that the amount expended for and on account of pensions during the year ending June 30, 1888, was nearly 31 per cent. of the entire disbursements of the general Government. The amount of pensions paid during the year was \$78,775,862, an increase over the previous year of \$5,308,280. The total amount disbursed by pension agents for all purposes was \$79,646,146. The cost attending such disbursements was in the aggregate \$3,262,524, it being a fraction less than 4 per cent. of the total expenditures of the Bureau. The total amount expended for all purposes was \$82,038,386, being 21 1/2 per cent. of the total estimated gross income of the United States Government for the period.

Mr. Jenner, of the British Legation, Buenos Ayres, in a recent report on the finances of the Argentine Republic and on the last Presidential message, states that the country is in a more prosperous condition than it has ever been before. As compared with 1886, almost every branch of industry and commerce showed an important increase in 1887. The total value of imports and exports rose from \$194,000,000 to \$218,000,000, and the first quarter of the current year shows an increase of \$4,000,000 over the same portion

of 1887. The number of vessels entered and cleared increased by 4000, with an increased measurement of 1,000,000 tons. The revenue in 1886 was \$46,762,000, while in 1887 it rose to \$58,135,000, and the excess of revenue over expenditure was \$6,217,000. The floating debt has been reduced by \$5,000,000, and about \$3,500,000 of Treasury bonds have been paid off. The credit of the Government with European banks is maintained by the deposit of a large number of shares of the Central Argentine Railway, but the President proposes to sell half of these, the remainder being sufficient to maintain the Government credit account in Europe. The external debt amounts to \$92,427,000, which the President calculates can be paid off in eight years. The Argentine credit, as shown by the quotations of the national bonds in the London market, is higher than it has ever been before.

In England, as in the United States, there is an increased demand for tonnage to be employed in the transportation of grain, so that shipowners are fast recuperating their weakened resources. A London circular relating to steamship tonnage says a large number of orders for new steamers have been given out, and several laid down on the strength of an expected further demand. Prices asked and obtained show about 5 to 15 per cent. advance on the lowest points touched, according to dates of delivery.

Judge Fairall has filed his opinion in the Iowa railway cases against the Iowa Railroad Commission, and in the test suit of the Chicago, Rock Island and Pacific Railway against the Commission, sustaining the injunction against the commission at all points, and quoting authorities to sustain his position. The Judge holds that the court has jurisdiction over the commission, and says that while the commissioners have discretionary power to fix rates, yet when they fix them so low that the earnings are thereby diminished to such a point that the company is unable to pay its fixed charges and operating expenses, then their act contravenes the spirit of the statute and is in violation of the constitutional right of the common carrier to a just and reasonable compensation and reward for his services. When the rates are not compensatory a court of equity has the authority to intervene. The Iowa Railroad appeal from Judge Fairall's decision will be heard at the October term of Court.

A retired iron manufacturer of Pennsylvania, Thomas Beaver, uncle of the Governor of the State, has erected and presented to the town of Danville, 50 miles from Harrisburg, a noble building called the Thomas Beaver Free Library. It was in Danville that the donor amassed his wealth in iron, and the institution stands as evidence of his regard for the people. The gift amounts to \$150,000. Of this sum about \$100,000 has been spent in the purchase of the ground and the erection of the building, \$10,000 has been used at once in purchasing books and \$40,000 of securities are given to the trustees as a permanent endowment fund.

The California vintage for 1888, as estimated by the secretary of the State commissioners, is 20,980,000 gallons, Napa and Los Angeles counties leading off with 3,500,000 gallons each. The raisin production is placed at 1,000,000 boxes or more.

Chief Arthur, of the Locomotive Engineers, on several public occasions lately has referred to the disastrous strike on the Chicago, Burlington and Quincy Railroad, and, at Pittsburgh, made a speech in which he said: "We are ready to submit the case to the arbitration of any three railroad managers in the country." Respecting the dynamite trial, he does "not

hold the Brotherhood responsible for a few weak men, whose actions were unauthorized," but there were "extenuating circumstances which trial will reveal." Mr. Arthur says the Brotherhood has a membership of 25,000 men and the firemen almost as many. He claims that morally and financially the Brotherhood has made great advances since it was organized, 25 years ago, when engineers got \$90 per month; firemen, \$30 per month; freight conductors, \$40 per month; freight brakemen, \$25 per month and passenger conductors, \$60 per month. To-day engineers get \$3.50 per run of 100 miles. Firemen get from 50 to 60 per cent. of that amount, and brakemen get \$4 per day.

Wm. Cramp recommends that the large war ships be built in dry docks and gives for his reason that they are too heavy to be built on stocks and that the risk of launching them without injury is very great. The dry dock now in course of construction at Newport News will be completed some time next month. Work on the Brooklyn and Norfolk docks is progressing rapidly.

The monthly chart just issued by the Hydrographic Office, at Washington, says in reference to the general understanding that now prevails among practical navigators respecting the northern and southern limits prescribed for steamers bound east or west in the Atlantic trade, that "this recent disaster would not have occurred had the Geiser been further to the southward, as recommended for eastward bound vessels, and the collision thus emphasizes the importance of this matter not only to owners, agents, masters and marine underwriters, but to the public generally."

The receipts of flour and grain at Buffalo by lake for the month of August aggregate 17,079,000 bushels, and for the navigation season 55,760,000 bushels. The railroad shipments to the East of grain received by lake are unusually large this season and aggregate 18,073,000 bushels to 19,711,000 bushels by canal.

The bow of the Thingvalla, which arrived at Halifax after her collision with the Geiser, is gone clean down to the keel, and from the collision bulkhead forward she must be built anew.

A Sugar Bounties Convention was held in London, August 30, at which nearly all the principal sugar-growing countries were represented, and the several delegates affixed their signatures to a document providing for the abolition of bounties for the manufacture and exportation of sugar. England agrees not to impose differential duties on cane and beet imports from the countries party to the convention. The countries signing the convention will exclude refined sugar, molasses and glucose coming from countries that have not signed the convention. The parties to the convention may be exempted from its operations by giving a year's notice, under certain conditions. The convention goes into operation September 1, 1891, and remains in force ten years. The trade in this city regard the negotiations as unlikely to result in any change affecting the American market.

The great trunk-line pool, of which Albert Fink is Commissioner, is reported to be so badly demoralized that its dissolution is probable, every effort to "fix up things" having proved futile. "Every line," we are told, "is making its own freight rates to all points; every passenger agent signs an agreement one day, only to break it the next, and when caught by one of Mr. Pierson's detectives the agent is called before the commissioner and asked for an explanation, whereupon a promise is made to reform, and the irregularities are continued." The further statement is made that "the Pennsyl-

vania is about to withdraw from the entire association unless it is abolished by mutual consent. Neither the Erie nor the Baltimore and Ohio pretends to live up to its agreements, and the managers of both agree that the present association is incapable. Every one is dissatisfied, and nearly all are in favor of saving the vast expense of the office, nearly or quite \$200,000 per year, and which, it is regretfully admitted, has not by any means succeeded in accomplishing its purposes. As yet there has been no positive course outlined so far as can be learned, but there is no doubt whatever as to the fact."

The annual report of Hon. Nicholas M. Bell, Superintendent of Foreign Mails, shows that of the Transatlantic mails dispatched in 1888 from this country 43 per cent. of letters and of postal cards and 51 per cent. of other articles went to Great Britain. Germany is next, with 21½ per cent. of letters and 20 per cent. of other articles. Then comes France with 6½ per cent. of letters and 7½ per cent. of other articles, and Sweden with 6½ per cent. of letters and 4 per cent. of other articles. The total number of letters sent from the United States to all foreign countries, including Mexico and Canada by rail, was 43,510,037. The total number of letters received from all countries was 38,451,364. The total cost of the foreign mail service was \$464,910. The estimate for 1890 is \$760,000. The compensation to Transatlantic steamers of foreign lines at the rate of 44 cents per pound of letters and 4½ cents per pound of printed matter was as follows for domestic mails: North German Lloyd, \$174,022.89; Cunard, from New York, \$88,385.17; White Star, \$14,204.76; Liverpool and Great Western, \$28,505.44; Anchor, \$5,094.40; Hamburg-American, \$14,628.76. The mails are awarded on the 15th of each month for the next calendar month to the steamers which show the greatest average speed for three trips immediately preceding the award, and under this system the mails have been materially expedited. With regard to subsidies to American vessels Mr. Bell says: "The policy of dispatching the mails by the fastest steamers tendered has met with so much favor with all classes of people that if at this late day they were deprived of the privilege of dispatching their letters by the quickest possible route it would undoubtedly create much dissatisfaction." The rates of compensation for sea conveyance of mails to foreign countries paid by Great Britain, Germany and the United States to national and foreign steamship companies is shown by the following table:

	To national steamers.		To foreign steamers.	
	Letters, per lb.	Prints, &c., per lb.	Letters, per lb.	Prints, &c., per lb.
Great Britain.....	72¢	6¢	44¢	4½¢
Germany.....	56½¢	4.3¢	44¢	4½¢
United States.....	\$1.00	8¢	44¢	4½¢

The last span in the great bridge across the Hudson River at Poughkeepsie was finished on the 30th ult., and the event was duly celebrated.

The forthcoming annual report of the General Land Commissioner will show that during the last fiscal year there were made 59,095 cash land entries of all classes, aggregating 5,907,254 acres, for which the Government received \$11,203,071. The whole number of entries of all classes, including Indian lands, made during the year was 255,119, embracing 24,485,833 acres. The total receipts from the foregoing were \$13,523,185. Of the whole number of entries 46,236 were original homesteads, embracing 6,676,616 acres; 22,413 were final homestead entries, embracing 3,175,400 acres, and 24,572 were timber culture entries, having an area of 3,733,305 acres. During the year the land grant

railroads made 40,786 selections, embracing 6,525,300 acres. Under school, swamp land and other grants by the Government to the several States and Territories 8029 selections were made, covering an area of 1,265,452 acres. In addition to the 24,485,833 acres entered under the various public land laws during the year the area of commuted homesteads, final desert entries, final homesteads, and final timber culture entries aggregated 5,647,543 acres.

Labor Day was more generally observed in this city and in many other large cities than on previous like occasions. In New York the number actually in the public parade is variously estimated at from 3000 to 8500. The building trades were not so well represented, but of slate and metal roofers there were some 500, and of journeymen horseshoers there were 350 in leather aprons. The tin and sheet-iron workers were also in good numbers, and a steam drill in operation attracted much attention. At Troy, where the iron mills were closed, also in Albany, Boston, Cincinnati, Buffalo, Newark, St. Louis and other points, there were large processions. At Cleveland the iron molders forcibly pulled down a red flag, causing much tumult, and in this city one arrest was made for distributing anarchist circulars; otherwise good order was preserved.

St. Louis is to have a new union railroad depot, to cost \$500,000.

An actual beginning has been made in clearing New York City of dead wires and dead poles. As a substitute the Fire Department has already contracted for cables to enable it to avail itself of the underground service, and the Brush Electric Light Company are drawing their first cable into the Broadway conduits, while the East River Electric Light Company have ordered an underground cable which is to be ready within ten days. Of the 1700 lines of wire entering the Central Telegraph Station in London not one is above ground.

It is now estimated that the new library building in Washington City, if built in accordance with the plans adopted, will cost \$10,000,000, so that all calculations heretofore made are thrown into confusion.

It is charged that millions of feet of Canadian lumber are smuggled into the United States free of duty. A letter from Calais, Maine, says: "The St. Croix River, with its source in the timber lands of Maine, forms a natural waterway from the logging camps to the mills. Further north the St. John River is used for the same purpose, though on the latter the logs are to a great extent manufactured in the interior of New Brunswick and shipped via St. John. The logs floated down the St. Croix are manufactured into lumber at the mills along its banks, of which a majority are situated on the Canadian side. These mills, at Frederickton, Edmonston, Woodstock, Deer Lake, Benton and Magaguadavic, all in New Brunswick, and a number of others near Calais, approachable only from the Canadian side, are the stations for the vast amount of lumber that has been illegally entered free of duty at Calais. During the last quarter of the fiscal year ending June 30, 1886, of a total of over 6,000,000 feet of lumber entered at the port of Calais, over 3,000,000 feet were admitted to free entry as original product of American forests."

Ten large business houses in Baltimore were destroyed by fire on Tuesday morning. Among those burned out were the hardware merchants H. S. King & Sons and Tabb Brothers & Dimmock, whose losses respectively are estimated at from \$40,000 to \$45,000.

MANUFACTURING.

Iron and Steel.

Recently the report has been extensively published that the Jackson Iron Company, of Fayette, Mich., were considering the advisability of removing their furnace plant from its present location, in order to secure better facilities for obtaining fuel. We are authoritatively advised that there is no truth in the rumor whatever. The company are making extensive improvements to their plant at the above place, with the intention of considerably enlarging their capacity for the manufacture of charcoal pig iron. They have no intentions whatever of moving from their present location.

The plant of the Stewart Iron Company, Limited, at Sharon, Pa., which has been idle for some time, resumed operations in full on Monday, the 3d inst., for the manufacture of steel blooms, with 13 puddling furnaces in operation. Employment was given to about 40 hands.

All departments of the Atlantic Iron Works of P. L. Kimberly & Co., Limited, at Sharon, Pa., are now in full operation, with the exception of the bar mill. Employment is given to a large number of hands.

Winona Furnace, of the Columbus and Hocking Coal and Iron Company, in the Hocking Valley, Ohio, which has been undergoing repairs for some time, has resumed operations again.

Steel rails weighing 90 pounds per yard have recently been rolled in the rail mill of the Bethlehem Iron Company, at Bethlehem, Pa., for use on the Philadelphia and Reading Railroad.

The Bellaire Nail Works, at Bellaire, Ohio, are running full in all departments, except the nail factory, which is still idle. Some embarrassment has occurred by shortage in gas, but nothing serious, as the appliances for using coal were not discarded when gas was put in. The blast furnace is making its usual output.

Frankstown Furnace, at Frankstown, Pa., operated under lease by James Pierpont, has been levied on by the sheriff on executions issued by G. W. Jackson & Co., J. R. Reynolds and W. F. Reynolds. The furnace has been in operation about two years, and was making about 20 tons per day.

A press dispatch from Youngstown, Ohio, under date of the 28th ult., reads as follows: "J. N. Whitman, of Syracuse, N. Y., the owner of a patent process for rolling hoop iron, is here negotiating with local capitalists in regard to erecting a mill for the manufacture of his specialty. His process, by which hoop iron can be rolled to any desirable length, and automatically rolled instead of bundled, has been tested at the Warren Rolling Mills and has proven satisfactory. It is likely that a mill will be established here."

Mill No. 2, of the A. French Spring Company, Limited, at Pittsburgh, which was recently damaged by fire, is again in operation, the repairs having been made.

The second furnace of the De Bardeleben Coal and Iron Company, at Bessemer, Ala., is to blow in at an early date.

Moorhead, Brother & Co., of Pittsburgh, proprietors of the Vesuvius Iron and Nail Works, located at Sharpsburgh, Pa., are adding a new heating furnace to their plant, which is an addition to the guide rolls. The motive power, which has heretofore been insufficient, has been increased by another engine, which has just been erected. The present run of the works turns out a greater amount than has ever

been known before, though formerly the mill has been on double turn in every department. Since the new improvements have been added the daily output is about 125 net tons, while the raw product of muck bars is little more than 50 tons a day.

The Belfont Iron Works Company, of Ironton, Ohio, who closed down their plant about two months ago to make extensive repairs, have started up again full time in all departments. During the stoppage one gas-producing furnace and two heating furnaces were added to the plant. They were constructed by Alex. Laughlin & Co., engineers and contractors, of Cleveland, Ohio.

The Gadsden Furnace (coke), at Gadsden, Ala., is to blow in on the 10th inst.

Wm. Clark's Son & Co., proprietors of the Solar Iron Works, at Pittsburgh, are about to place in their puddle department a rotary squeezer of 50 to 60 tons weight, which is to be driven by a reversing engine, so that in case of a "sticker" the ball can be backed out. The machine is being constructed by the Lewis Foundry and Machine Company, Limited, also of Pittsburgh.

It is stated that an effort is being made to start up the plant of the Cartwright Iron and Steel Company, at Steubenville, Ohio, which made an assignment about two months ago. The works were formerly known as the Alikanna Rolling Mill. The unsecured claims amount to \$45,000. Some of the heaviest creditors now propose that the company give long-time notes for 40 per cent. of the indebtedness in full satisfaction of the same, the notes to bear 6 per cent. interest. Then the company will spend \$10,000 in making betterments to the plant and resume operations. The plan is likely to be accepted by the balance of the creditors as a possible means of making good a portion of their claims.

Norway Furnace at Bechtelsville, which went out on the 23d ult., has begun to reline, and will probably start late in October.

Katherine Furnace at Carlisle, Pa., went into blast on the 29th ult.

Some months ago the Carbon Iron Company, of Pittsburgh, secured control of the Fort Pitt Iron and Steel Works, in that city, and have since been busily engaged in making extensive additions and changes at the plant with the object of making the manufacture of structural steel a specialty. Horace W. Lash, formerly with Park Brothers & Co., Limited, of the Black Diamond Steel Works, was secured as general superintendent. Mr. Lash is the inventor of the well-known Lash steel melting furnace. The company have just finished the erection of an open-hearth steel-melting plant consisting of two 15-ton Lash steel melting furnaces, and have commenced the manufacture of steel. They have also put in a large universal mill that was completed on the 1st of September to furnish universal rolled plates 36 inches wide of any length or thickness required for structural purposes. Also slabs from 6 to 30 inches wide, and from 2 to 6 inches thick, and blooms from 4 to 8 inches square. The mill has been run to work down its bearings.

Emma Furnace, of the Union Rolling Mill Company, Cleveland, Ohio, was blown in on the 30th ult.

Crafts Furnace, at Greendale, Ohio, one of the furnaces of the Columbus and Hocking Coal and Iron Company, has blown in.

The extensive improvements now being made to the Soho Furnace of the Moorhead-McCleane Company, at Pittsburgh, are rapidly approaching completion, and

when finished the furnace will have a capacity almost double what it was before the improvements were commenced. The bosh has been increased from 16 to 19 feet, and height of stack from 65 to nearly 90 feet. Along with the increase in diameter and height, the further improvement of fire-brick stoves in the place of cast-iron stoves has been made, and other changes of minor character, but so many of them as will in the aggregate add greatly to the convenience and economy of operating. It is expected that the furnace will be ready to commence operations about October 1, next.

Fannie Furnace, operated by J. C. Hamilton, Shawnee, Ohio, trustee, will resume operations in a few weeks. A new bosh has been put in, general repairs have been made, and a new brick casting house, 37 x 85 feet, is being put up to replace the old one recently destroyed by a wind storm.

Walton Furnace, charcoal, at Max Meadows, Va., one of the plant of the Lobdell Car-Wheel Company, of Wilmington, Del., was blown in on September 1.

Machinery.

At the recent sale of the assets of the Smith, Beggs & Ranken Machine Company, of St. Louis, John D. Ranken, a member of the firm, purchased the realty, buildings, tools and patterns for a sum slightly exceeding \$63,000. Stock, finished and partly finished, and other minor assets, will be sold later on.

Eynon & Marshall, engine builders and machinists, of Cleveland, Ohio, are receiving numerous orders for their slab-milling machine. On account of an increase of orders the company have been compelled to erect a new factory, which they expect to occupy in November next.

The American Manufacturing, Mining and Milling Company, of Cleveland, Ohio, have just completed the erection of a 50-ton crushing and concentrating plant for the Humboldt Mining Company, at Lordsburg, New Mexico.

P. F. Goode, proprietor of the American Nail Machine Company, at Ashtabula, Ohio, has signed a contract for the removal of his establishment to Findlay, Ohio, and has already let the contracts for the new buildings, which are to be large and commodious and will be completed in November next. When completed the new works will give employment to about 150 skilled workmen.

The Oakland Iron Works have been incorporated, at Oakland, Cal., with a capital stock of \$50,000, to manufacture machinery, milling supplies and foundry work of all kinds. The directors are George Cottrell, T. L. Armstrong, Edward Clark and others.

Messrs. Curtis & Curtis, of Bridgeport, Conn., manufacturers of the Forbes patent die stock, pipe cutting and threading machinery, are still running overtime in their new works. Their July shipments were the largest of any month since they have been in business, but they overran even this in August, when the shipments exceeded those of July by over \$500. They are particularly busy filling orders for their power pipe machines, among which are orders from South Africa, Texas, Montana and San Francisco.

The Cleveland Twist Drill Company's new works are progressing rapidly. They expect to get into the buildings on November 1. The main building is 100 x 40 feet, with tempering and forge shops adjoining. New machinery will be added to keep up with increase in business.

Messrs. Lodge, Davis & Co., Cincinnati, Ohio, expect to have the addition, now being erected, to their plant fully com-

pleted by September 15, when they will have 6000 square feet of floor surface devoted to manufacturing purposes. Their business has more than doubled in volume within the past few years. August was the largest in point of business in the history of the establishment.

Hardware.

The Iron City Chain Works, of James McKay & Co., on Twenty-ninth street, Pittsburgh, resumed operations on Monday, the 27th ult., after a stoppage of nearly two months, to make repairs. Orders at this establishment are reported as being rather scarce.

The Baltimore Nail and Screw Company have been incorporated at Baltimore, Md., with a capital stock of \$15,000, to manufacture nails and screws. The incorporators of the new enterprise are Joshua J. Underhill, James T. Armstrong, George C. Galch, William S. Dorman and Jacob S. Barnes.

The Empire Wringer Company, Auburn, N. Y., advise us that while their sales in 1887 were larger than ever before, the sales to July 1 this year show an increase of 25 per cent. over the corresponding period of last year. They have enlarged their facilities somewhat since January 1, but the factory is now closed for necessary repairs, but will start up again with some new machinery and an additional force in a few days.

Miller Lock Company have removed their office and works to Frankford, Philadelphia. The new location is an advantageous one in many respects, more especially in the matter of working space and shipping facilities. The new plant is located on Tacony street, below Orthodox, the dimensions of which are 100 x 200 feet, with two-story factory 50 x 84, and foundry 20 x 40. The company inform us this step was necessary on account of the constantly increasing trade, which often taxed their facilities in the old plant to make seasonable deliveries. With their present capacity they are in a position to readily meet double the demand of the past year.

Miscellaneous.

From the Marquette, Mich., *Mining Journal*, of the 25th inst., we take the following: Lake shipments of iron ore for the week ending with Wednesday, the 15th, amounted to 202,384 gross tons. Of this total 49,564 tons went from Marquette, 82,804 tons from Escanaba, 3138 tons from St. Ignace, 52,076 tons from Ashland, Wis., and 14,802 tons from Two Harbors, Minn. The lake shipments for the season now amount to 2,431,330 gross tons, or within 219,782 tons of the quantity shipped at the corresponding date in 1887. By ranges the shipments are as follows: Marquette range, 950,305 tons; Gogebic range, 711,562 tons; Menominee range, 579,147 tons; Vermillion range, 190,316 tons. The following table shows the shipments by port up to date this season in comparison with the shipments for the corresponding portions of the two preceding years:

Port.	1886.	1887.	1888.
Marquette.....	403,328	499,306	553,488
Escanaba.....	1,172,875	1,232,787	886,397
St. Ignace.....	68,671	55,469	41,689
Ashland, Wis..	597,140	652,018	401,146
Two Harbors,			
Minn.....	190,316	211,442	189,227
Total.....	2,431,330	2,651,112	2,071,947

The Gorham Manufacturing Company, silversmiths, of Providence, R. I., have begun the erection of a monster factory in Elmwood, a western suburb. The big factory will consist of 12 buildings, to be completed a year from next November. There will be a little short of one mile of foundations. The main structure will be 419 x 256 feet, two buildings will be 419 x 225 feet and each will be 44 feet wide and

three stories high. The main preparatory building will be 225 x 80 feet, one story, and here will be carried on the heavy press and drop work. The exhibition room will be 200 x 65 feet and two stories high. The buildings are all to be of brick, with granite and brown stone trimmings. About 1300 hands will be employed.

A press dispatch from Charleston, W. Va., under date of the 28th ult., reads as follows: "The property of the Boone & Raleigh Coke and Coal and Railroad Company, and of the Black Band Iron Company, consisting of 3690 acres of land, was sold to-day to L. B. Russell, of Lynn, Mass., for \$250,000."

The Avonmore Coal and Coke Company, of Pittsburgh, with a capital of \$10,000, were chartered at Harrisburg last week.

The Perry Stove Mfg. Company's works at South Pittsburgh, Tenn., 20 miles west of Chattanooga, are again overtaken by disaster, the boiler having exploded early on Monday morning, September 3. Six men were instantly killed, among whom were Charles Taylor, the superintendent of the works, J. B. Mills, a machinist, M. Donovan, foreman of the mounting department, George N. Carter, a leading jeweler of the town. The boiler and engine were in the corner of the molding room and the whole side of the building was torn away for a distance of 40 feet.

The S. Obermayer Foundry Facings and Supply Mfg. Company, Cincinnati, have again been compelled by reason of their largely increased business to erect an additional structure to their already large plant in the nature of a new ware and storage house, the dimensions of which are 121 by 82 feet. The new structure, when completed, will enable the company to devote more space to the production of their goods.

Two notable buildings are in course of erection in New York. Perhaps the most interesting piece of work now in progress is the office building which J. Noble Stearns is erecting at Nos. 50 and 52 Broadway and Nos. 41 and 43 New street. It will be the highest structure on the same width of ground which has ever been erected. It will be 13 stories in height on Broadway and 15 on New street, and when completed will enjoy the distinction of containing more stories than any other office building in the city, and probably in the country. It will also have the curious reputation of having been built upon a lot which has only a frontage on our greatest business artery of 21.6 feet, while it will be 39.4 on the other side, with a depth of 159.7. The construction is exceptional, the building being carried up to the fifth story with iron, the stories above being of brick. It will be fire-proof throughout, and cost about \$225,000. The architect is Bradford L. Gilbert. The most expensive down-town building in progress is that being erected for the Bank of America, on the northwest corner of Wall and William streets. It is to be nine stories in height, 70 x 80 in size, and perfectly fire-proof. The front will be of stone, the first two stories of granite and the seven floors above of Indiana limestone. The architect, Chas. W. Clinton, estimates that the new structure will cost complete about \$400,000. To the foregoing may be added the *Times* building, fronting City Hall Park, whose lofty arched walls are reaching a conspicuous elevation.

One of the late fast train runs from London to Edinburgh was made in seven hours and fourteen minutes, exclusive of stoppages, at an average speed of 55.4 miles an hour.

NEW PUBLICATIONS.

THE LIXIVIATION OF SILVER ORES WITH HYPOSULPHITE SOLUTIONS. By Carl A. Stetefeldt. Published by the author, 18 Broadway, New York. Price \$5.

The penetration into greater depths of our mining operations in the Rocky Mountains, coupled with the possibility of treating leaner ores, has considerably enlarged the field of the metallurgist, and the old days of the "muscular amalgamator," as Mr. Stetefeldt calls him, are fast passing away. He is being superseded by men who have at their command both theoretical training and practical experience, a class of whom the author has been a pioneer and is still the acknowledged leader in this country. When some years since Mr. E. H. Russell, then connected with the famous Ontario mine of Park City, Utah, discovered that a solution of a double salt of cuprous hyposulphite and sodium hyposulphite acts powerfully as a solvent of silver and its compounds, Mr. Stetefeldt took an active interest in developing the possibilities of what is now known among silver metallurgists as the Russell process. Both the inventor and Mr. Stetefeldt freely published the results of their investigations in contributions printed chiefly in the "Transactions of the American Institute of Mining Engineers." The work was thorough and painstaking, its latest fruits being given to the public in the work before us, which may well serve as a model of special metallurgical treatises.

It would carry us too far to discuss in detail the contents of the book, since the subject is one in which but few of our readers are directly interested. Suffice it to say that Mr. Stetefeldt treats in the first part the chemistry of the process throwing a clear light upon many formerly obscure and neglected points, largely upon the basis of special experimental researches. The second part deals with the practical execution of the process, including a description of plant and appliances, the points to be considered in connection with the solutions, the handling of the ore and the liquors, the precipitation of the metals dissolved and the treatment of the sulphides resulting therefrom. He gives notes on the construction of the plant, its cost and the expenses of running a mill, and, finally, goes into a comparison of the new process as compared with amalgamation as shown by actual results obtained at a number of mills. Mr. Stetefeldt's is a standard work which has met with well-deserved praise by those interested in the metallurgy of silver.

A Winnipeg dispatch reported that the Manitoba Legislature ratified the agreement with the Northern Pacific Railroad by a vote of 26 to 10, five supporters of the Government being among the minority. The main feature of the document is the transfer to Northern Pacific control of the Red River Valley Road from Pembina to Winnipeg, and the extension of 51 miles from Winnipeg, which the Government is now building. The Northern Pacific agree also to build a line from Winnipeg 135 miles northwest to Portage la Prairie, and guarantee a very low maximum rate on freight from Northwestern points to Duluth.

The Island of Cuba, Edgar L. Wake-man says, in a letter to the *Republic*, offers a splendid field for the culture of coffee. One-half of the southern slope of the island is cultivable as the finest coffee lands of the world.

Collector Magone at this port is showing more vigilance in returning paupers to Europe

The Iron Age

Protection and Progress.

Mr. David Wells, who certainly cannot be fairly suspected of a tendency to underestimate the importance of the tariff question, has shown, in a series of striking articles on the economic disturbances of the past 15 or 20 years, that a cause has been operating, in the presence of which tariffs, currencies, banking systems and economic legislation of all kinds are relatively insignificant—so insignificant, in fact, that it is scarcely possible to detect their effect in the experience of this or that civilized country, during the period named, in modifying the effects of the greater, deeper and more general cause. The one thing that can be declared of the unparalleled economic disturbances of this period is, that they have affected different nations in proportion to their advancement in civilization, as measured by the use of machinery. This fact alone is sufficient to indicate, what is abundantly susceptible of proof in other ways, that this main cause has been the almost revolutionary progress of every branch of industry, and the astonishing reduction of cost in every department of production and exchange. A very large proportion of the invested capital of civilized nations has thus been destroyed, and a very large proportion of their industrial laborers has been forced to change of employment, with the inevitable result of a visible increase of the number who are, at a given moment, temporarily out of employment.

These stupendous changes are the sudden result of a century of invention and preparation. As the rains on the upper tributaries of the Nile, swelling hundreds of streams at once, produce a flood in the main stream that comes on like a tidal wave, so innumerable labor-saving contrivances and scientific discoveries, new applications of steam and electricity, new enterprises like the Suez Canal, new materials like petroleum and natural gas, have combined with well-nigh catastrophic results; and thousands of men, both rich and poor, have had sad experience of the irresistible nature of Progress.

It is not true, as Mr. George insists, that this world-wide force tends to increase poverty. It is not true that of the greater wealth produced the laborer gets less than ever. On the contrary, the manual workers are those who have been most benefited; and it is capital which has suffered the greater loss, and receives, and will continue to receive, a diminished gain. We need not travel again the well-worn road of this demonstration. Starting from the proposition that progress is a good thing, we wish to point out some relations between it and protection, the importance of which has been overlooked; and under the head of protection we include the patent laws and the tariff.

Let it be remembered that this progress which has produced such immense results

in recent years has been general throughout Christendom. Our proposition is, that the patent laws and the protective tariff of this country have been important factors in it. We do not concern ourselves at this time with any other relations of either factor. We do not purpose to discuss them "on their merits." We shall simply indicate facts which ought to be taken into account in such a discussion.

The principal means of the progress we are considering is the interchange of ideas. Free trade in these is worth more, to producer and consumer alike, than free trade in anything else could possibly be. This principle lies at the foundation of patent laws. It is recognized that society will be the gainer if a man who has devised a new and valuable improvement in any art will tell plainly what it is, instead of keeping it as a trade secret, perhaps to die with him. Consequently he is paid for making public what he would otherwise conceal. A monopoly is granted him—a monopoly which is, in this country, more absolute in its nature and longer in its term than in any other. At the end of its period the public inherits the advantage of a free use of his invention. During the period it is directly his interest to explain it, to demonstrate it, to advertise it and to introduce it as widely as possible in practice. This stimulates other inventors in the same line to seek similar rewards. With all the defects in administration which characterize the American patent law, it must be admitted that it has been a chief cause of the extraordinary fertility of invention among us. And the principal reason is that American inventors are so well rewarded and protected that they would rather take the absolute monopoly offered them by our laws for 17 years than try to protect themselves by secrecy. Important trade secrets are rare among us. Everything patentable—in other words, everything new, useful and capable of the necessary precise description—is patented, and so made public. The resulting revenue is poured for a while into the pockets of the monopolist and his grantees, but the intellectual treasure, the contribution and the impulse to progress, is bestowed instantly upon the public. The protection of the patentee against home competition makes him communicative, and this communication of new knowledge is cheaply bought by the community at the price of a monopoly.

Now, the protection against foreign competition afforded by a tariff has a similar effect. The reason that an English ironmaster traveling in this country can obtain easy access to all our great establishments, see anything they contain, watch all their operations and obtain analyses, samples and drawings, while an American in England or on the European Continent finds it hard always, and impossible often, to obtain such facilities, is that our manufacturers do not fear that their improved methods adopted abroad will come back to plague them with competition. Of course the Belgian or British manufacturer has in most cases no fear of direct American competition, and Americans will be admitted if anybody is; but the danger that valuable secrets of practice may thus leak out and get to the knowledge of the enemy is often too important to be trifled with, and hence "No

admittance" is inscribed upon the door. These deficiencies are not due half as much to any national characteristics as to the features of the business situation as determined by international commercial competition. It is often said that if all barriers were removed American ingenuity would enable us to compete on equal terms with foreign rivals. Those who say this overlook two things: First, that to be effective in competition such ingenuity must operate secretly; secondly, that to keep secrets from foreigners we must keep them from each other, and that this would destroy the very atmosphere of free interchange of ideas in which our national ingenuity has been bred. It is not an inherent quality in our blood which must find expression. Foreigners who come among us manifest it speedily enough. As a factor of progress it is the product of our laws, and it may be nullified by changing the conditions which now favor it.

To complete our demonstration it remains to show that the two agencies of protection above named operate internationally to produce and to accelerate progress. If our contention be true, we ought to find not only that within our own country the free interchange of ideas favored by protection has rapidly improved industrial practice, but also that the dissemination of American ideas abroad has been exceptionally free and wide, and has perceptibly affected foreign practice. This we shall undertake to show in another article.

Proposed Restoration of a Central American Union.

The necessity or desirability of reuniting the five Central American republics is so universally felt that a serious effort is to be made this time to bring about the event, and lay down the foundations for a permanent union. With the example of regenerated Mexico at their doors and the Panama Canal work still going on in the neighboring Colombia at the south, and the revival of a Nicaragua Canal scheme, Central Americans feel that the time has come for a strong State to hold the balance of those two nations. The feeling is strengthened, moreover, by the harmony at present existing between the five republics and their respective presidents. Costa Rica has in this instance taken the initiative, and in a month or two a Central American Congress is to assemble at San José de Costa Rica for the purpose of framing the new compact. The first union lasted from July 1, 1823, to 1840. On February 28, 1885, General Barrios, President of Guatemala, issued a proclamation attempting a restoration; finding, however, that there was not the response he counted upon, he invaded Salvador with an army and fell in the first engagement, at San Lorenzo, on April 2. One of his generals, Francisco Menendez, continued the war, and seized the Presidency or rather Dictatorship of the invaded State. He has remained the President of Salvador ever since, and, after a short, desultory warfare, peace was restored throughout Central America. The absorbing individuality of General Barrios having disappeared, there seems to be no further obstacle.

The main staple produced in Central America is coffee, which since 1885 has risen so much in value that the planters

have grown rich, and prosperity has extended over the length and breadth of the land. The finances have vastly improved, indebtedness has either been reduced or consolidated at a lower interest, and railroad building resumed. In fact, the combined public debts of the five republics do not reach \$30,000,000 silver to-day, and with a joint population of 3,000,000 the new Union would owe less money relatively than any country south of us, while its credits abroad for the prosecution of public works would not fall much short of that of Chili. In other words, both American and European capitalists would undoubtedly be eager to complete the Central American railroad system if the new State were to allow some subsidies or merely guarantee the interest on railroad bonds issued by private companies. A prosperous, strongly constituted State, with the prospect of continued peace, would indeed have greater loaning power than the five comparatively poor republics as they stood in 1885.

The census of 1880 showed the population to be distributed as follows:

	Area. Kilometers.	Inhabit- ants.
Guatemala.....	121,140	1,357,900
Salvador.....	18,720	634,120
Nicaragua.....	133,800	259,794
Honduras.....	120,480	323,274
Costa Rica.....	51,760	213,785
Totals.....	445,900	2,788,873

Indians form a large portion of the population, but they are peaceful and industrious, and constitute a valuable help on the coffee estates. Although immigrants from Europe would be welcome, and find a healthy climate on the great plateau and mountain slopes, Central America can dispense with them. Even on the low lands the climate is so salubrious that the American surveying expedition in Nicaragua did not lose a single man; there was even a total absence of sickness, although they were often busy in the swamps. There is not a plant indigenous to tropical America which does not flourish in that part of our continent. At the same time, the mineral resources, of Honduras in particular, are magnificent. American capital is largely interested in mines, gold especially, and has been in railroads for 15 years past, in Costa Rica notably. Our trade has been as follows:

Import.	
1886.....	\$5,966,769
1887.....	8,420,491
Domestic Export.	
1886.....	\$2,467,632
1887.....	3,668,506
Totals.	
1886.....	\$8,434,401
1887.....	12,094,997
Increase.....	\$3,660,596

This increase is equal to 44 per cent. It is due, chiefly, to the rise in coffee and increased prosperity, calling for more American goods. San Francisco also does a large Central American trade, both import and export. There are few, if any, countries with which our trade increases as rapidly, especially now that the fruit business is being entirely transferred from sailing vessels to steamers.

Everybody, besides, wishes the Nicaragua Canal enterprise good success. This time it is systematically pursued; all the necessary preliminary steps have been taken, nor will there be a lack of capital. The canal will not be a work so expensive that there will be a necessity for appealing to

European capitalists; all the money that is wanted can be procured among us, and it will be an essentially American enterprise. It does not matter whether the Panama Canal be abandoned or not, for there will be traffic enough for both. At any rate, what we have shown will suffice to prove the growing importance to us of Central America, and the deep interest which the union movement has for us.

The Advance in Old Rails.

The rapid advance in the price of old iron rails in the West, which occurred in the third week in August, was one of those surprises in the iron trade which confuse the wisest. There had been some premonitory symptoms, it is true, but they were of a character to be accounted for in almost any condition of the market by a mere temporary increase in the demand. The price had fallen steadily from the beginning of the year, when they were sold at \$21 to \$22 at Chicago, until \$17.75 was touched in the middle of June, and \$18 to \$18.50 seemed like a very fair price to both buyer and seller. Up to that time old rails had been neither scarce nor yet over plentiful in the Western market. The supply was about equal to the demand, and prices simply moved in sympathy with the fluctuations in the value of other iron and steel. But when the lowest price named was realized there was a sudden revulsion as though bottom had been struck and a reaction was imminent. It is possible that if the Western rolling mills had not been just then on the eve of stopping to enter the fight for the wages scale for the coming year the rise in price would have taken place at that time.

This was an unfortunate suspension of animation in the old-rail trade for some of those interested in it. They misunderstood the exact situation of affairs, and presuming that another downward plunge would follow they either took contracts at ruling prices for future delivery or deferred purchases to fill old contracts until prices were lower. Herein they erred, but they were no more mistaken in their forecast of the market than their colleagues who refused to purchase at the prices offered and to take the chances of unloading at a higher or lower price in August or September.

Those who "went short," however, at \$18 to \$18.50 were unable to cover their contracts without loss in July, and when August came they found the Western rolling mills their active competitors in bidding for all available lots of old rails. The most active demand and the most decided upward movement in prices occurred in the third week of August, when a sudden jump was made from \$21 to about \$24 at Chicago. No warrant seemed to exist for such a sudden advance beyond the one very important fact that the supply of old rails was limited, but this was by no means a new discovery. It was known as well in June as in August. The rolling mills starting up needed a supply of material, it is true, but the condition of their business would hardly seem to justify the payment of 25 to 30 per cent. more for it than they were paying when they shut down. For a time rumors were current in the West of a combination of capitalists endeavoring to "corner" the old rail supply, but diligent

inquiry develops circumstances totally at variance with such a scheme. The "short" contracts taken when old rails were very cheap were hardly of sufficient importance to influence the market, although the efforts of the parties to cover became an interesting feature of the rapid advance. A speculative movement has developed, too, as the result of the existing condition of affairs, and some lots are being held in the West which the owners state that they do not propose to sell until the spring.

Other materials have begun to appreciate in value, either in sympathy with old rails or from the same cause which advanced their price, whatever that may be. The concurrent conditions of the general iron market may therefore favor the continuance of the higher rates for old rails which have been established, especially as the supply has apparently grown no more plentiful since the advance. As the price of new steel rails and old iron rails represents a difference of but \$6 to \$7 per ton, it would seem to be a very good time for railroad companies to make renewals, as a very small expenditure of cash would be required, unless they have now but a limited mileage of iron track in use. This is an important consideration in prognosticating the future course of old iron rail prices. The supply must, in the nature of things, get less and less every year with the exclusive use of steel rails for new tracks and renewals. Possibly this very year has been the first in which the long-expected curtailment of the supply of old iron rails has made itself manifest.

The English Naval Maneuvers.

The recent British naval maneuvers have shown England's naval forces in a pitiful light. So persistently have her war vessels been held up by every one as models of what modern fighting ships and cruisers should be, and so confident have always been the official statements of high speeds, that the accounts of the first completed performance will, no doubt, be surprising to the general reader. We have always held that the trial-trip speed schedules, according to which warships are customarily rated, are not only untrustworthy, but seriously misleading, and give no assurance whatever that a vessel listed as a 15-knot ship, for example, can ever attain this speed in regularly running. The trial trips, as conducted, last only from four to six hours; with this short time even the contract speeds can be maintained and the ships made to fill the stipulated requirements only with the greatest care, straining everything to the utmost. The most favorable conditions, moreover, are secured during these trials, conditions in part, which are rarely, if ever, realized in regular service, and the ships which go forth as 14, 16 and 18 knot vessels, as the case may be, are in truth anything but the promising specimens as which they are represented. It would perhaps be difficult to obtain a more striking demonstration of the truth of this than the maneuvers in question. The failures, as given in the available accounts, were of two kinds, all the ships, with one or two exceptions, having shown themselves to be much slower than claimed, and the machinery having in many cases broken down or got out of order. The slowness of the ships

was indeed something surprising, though the general state of inefficiency was none the less marked, and is graphically portrayed as follows, by the London *Engineer*.

We have no very definite information on the matter as yet, but enough is known to prove that little dependence can be placed on the marine engine in the navy. We do not speak now of torpedo-boats, but of large ships. Admiral Baird doing his best to get to Dover was severely hampered on the way. On Saturday Admiral Baird took his six fastest ships, leaving behind him what ought to be a powerful force to join him as soon as possible. The utmost that could be got was a pitiful 9 knots. The old Northumberland did this with two boilers to spare. The boilers of the Shannon were in trouble, and the Northampton could not keep up; when asked to get on a little quicker she telegraphed that she was doing her best. The Inflexible broke down with her starboard engine and dropped astern, still keeping her port screw going. On the preceding Wednesday the big ends of the Neptune's connecting-rods began to knock so hard that, although the enemy was believed to be in sight, she had to go into Holyhead for four hours to take up the slack. Seeing that the ship has not steamed 500 miles continuously, this seems a strange state of affairs. Next the Shannon blew the packing out of her high-pressure piston-rod gland, and she had to stop for half an hour.

Truly a remarkable condition of things. Had all these mishaps occurred in actual warfare our English cousins would have been badly handled. But comment is scarcely necessary. The facts, as presented, speak for themselves and certainly do not add to the glory of the British navy.

Waterways and Railways.

The new Railway Regulation act passed by the English House of Commons makes some decided changes in dealing with the difficult subject of transportation regulation. It provides that freight rates on the canals shall be reduced by the commissioners whenever it shall appear that they are made unjustly high by the railways. This is so worded because the railways in England have acquired ownership of many of the most important canals, and have so arranged the water tariffs as practically to divert traffic to their own rail lines. It was the opinion of the House of Commons that the merchants should have the benefit of water competition, if necessary, under compulsion of law.

The question of water and rail competition is an old one, but has lately called out more discussion. Waterways are to-day receiving great attention from the governments of Continental Europe. It is proposed to make the already fine rivers of Russia, Austria and Germany more capable of carrying a large freight traffic, while there are many proposals for artificial canals—such as the one to connect the Baltic with the North Sea. In the United States we have already had deep sea conventions to urge the necessity of a suitable port upon the Gulf of Mexico and the importance of the matter to the citizens of Colorado and other Western States, as well as the one more immediately interested—Texas. It is undoubtedly true that the days of usefulness for short and disconnected canals have passed away. Such waterways not forming parts in through routes cannot compete with the railroads, but the case is otherwise where such great through lines by water can be established. There is no danger of the commerce of our

lakes falling into permanent decay, nor, indeed, upon any canal or river connecting with them, except from neglect on the part of the Government and the people directly concerned.

Are such rivers and canals, supported at public expense, unnatural and unjust competitors with railroads? Facts do not show any real ground for this assumption. At first, indeed, we see the waterways taking from the railroads, by reason of lower prices, a certain amount of business which, were it not for the waterway, would go by rail; but the loss is not a real one. There are certain articles which for successful manufacturing demand the lowest possible rate per ton, a rate which for any distance the railroads, under our present circumstances, can scarcely be expected to quote, or if they do, it is under compulsion. But these raw materials once moved at the cheap water rate, there arise large manufactories which give to the railroads carloads of finished product, tons of freight to and fro at comparatively high figures, breadstuffs and supplies to the tradesmen and finally a large passenger travel. All these advantages to the railroad arise from the establishment of a manufacturing center, whose profits in turn may depend upon the cheap water carriage of its raw material. Under such conditions it is an economic error to give undue prominence to the cheap traffic lost to the rail carrier without regarding the far more valuable tonnage at higher rates which these conditions secure to it. It is in the long run no disadvantage to a railroad to have even severe water competition; the situation of many of our most thriving railroads confirms this view. If this be the true view to take of the establishment or maintenance of connecting waterways, it follows that the opposition to them on the part of our transportation men is not dictated by a far-sighted policy, and their evident distrust of the first effects of water competition should be allowed only its due weight in considering the enlarging of our water system. What will benefit the manufacturer and dealer will in the end benefit the carrier also. Here, too, appears the error in allowing the railroads to buy up and abandon or but partly use their competing canals. The Pennsylvania Railroad has followed English precedent in this respect, as we think to its own detriment as well as to that of towns and cities interested. At least no more of our waterways should pass into railroad control without carefully guarded provisions as to operation. This, then, is the justification for the spending of money by the Government, either State or national, upon improved and cheaper means of transportation. It is a public work which, if done in reason and with a wise policy, must inure to the benefit of all our interests, our railways being included.

The law of compulsory insurance of workmen against injuries in Germany has now been in force for over two years, and ironmasters in that country are getting into a position of being able better to count the cost. The results of such an investigation are not calculated to make them very contented with the law or to lead them to look with equanimity at the efforts to force them to acquiesce in the proposed act providing pensions for work-

men. A recent issue of *Stahl und Eisen* contains some very instructive figures. When the insurance act was passed the Government presented estimates to show how the payments for compensation to men injured at work might be expected to grow, taking the sums paid in the first year as the unit. Tabulated, the progressive increase is as follows:

1st year	1.00	17th year.....	19.67
2d "	2.48	20th "	21.88
3d "	4.00	45th "	32.07
10th "	13.10	70th "	33.23

The increase from year to year is, of course, due to the growing number of men receiving compensation for injuries rendering them invalids. Now, for the first 15 months, from October 1, 1885, to December 31, 1886, the money paid to injured workmen was 67,118.98 marks in the association of iron and steel works of Rhenish Prussia and Westphalia, the largest branch in the country. The number of men insured was 70,313, on an average their total wages for the 15 months being 83,841,224.71 marks. In 1887 the sum paid was 226,347.09 marks on 72,101,410.79 marks wages paid to 74,179 men. These figures are exclusive of the cost of administration, 43,753.20 and 35,014.65 marks respectively, and exclusive of payments to reserve fund, which was 201,356.94 marks for 1885-86 and 452,694.18 marks for 1887. Per capita the damages, exclusive of cost of administration and reserve fund payments, were 0.95 marks in 1885-86 and 3.05 marks in 1887, while per 1000 marks of wages the payments for compensation to workmen injured footed up to 0.80 marks in 1885-86, rising to 3.14 marks in 1887. It is this rate of increase which is staggering to German ironmasters contrasted with the official estimates. The sum is nearly four times greater during 1887 than during 1886, instead of being less than two and a half times greater. If the present rate goes on German ironmasters will soon have to pay 2 per cent. of the wages earned for damages for injury sustained, exclusive of the cost of administration.

According to reports on the industrial situation in England, made to the London Board of Trade, there is every indication of a moderately prosperous autumn and winter, in pleasing contrast to those of the last three years. Seventeen trade societies have reported that of their membership of 186,120 persons 7000 are unemployed. During the past month the proportion of unemployed workmen reported has fallen from 5 to 4 per cent., in comparison to 9 per cent. unemployed at this time last year. The industrial situation is not up to that of seasons of really good trade, but is steadily improving.

M. Nathan, of the firm of Swarts & Nathan, among the most prominent Chicago wholesale dealers in old iron, returned on August 29 from a four months' trip through France, Germany, Austria and Russia. He received a most flattering ovation from his friends and business acquaintances on his arrival home.

Contracts for materials for the armored steel cruiser Maine were awarded as follows: Calvin A. Baynon, New York, screws, \$396; Rowland A. Robbins, New York, wrought iron, lead, zinc, tin, hardware, varnish, ship chandlery and leather, \$14,475; J. J. Donovan, New York, nails, locks, hinges, linseed, sperm and lard oils and alcohol, \$1834.

CORRESPONDENCE.

The Influence Of Aluminium Upon Cast Iron.

DETROIT, September 1, 1888.

To the Editor: My attention has been called to a criticism of my tests, by Mr. A. E. Hammer, on page 318 of *The Iron Age* of August 30.

The question as to the influence of the contained silicon is a fair one, but, as against my published results, he makes positive statements regarding the effect of very small percentages of silicon upon my white cast iron, is it not fair for me to demand of him experimental proof of his statements?

He evidently is not familiar with the characteristics of this white iron, containing only 0.03 sulphur and 0.186 silicon, when he says that "the carbon is near the balance—that is, near the point where it will readily assume either the combined or the graphitic form," and his erroneous statement that my iron contains 0.3 sulphur makes his assumption vastly more wide of the mark. Until he produces experimental proof to support his statements, the only way for me to disprove them is to give results from my own experiments.

He states that 0.02 per cent. of silicon would produce a perceptible change, and that 0.44 per cent. would be sufficient to account for the gray grain and the taking out of chill that I ascribe to aluminium. The facts are that this white iron is most persistently white, and the result of a large number of experiments with this iron shows that such balance as he speaks of is not reached until 2 per cent. of silicon is added, and it took 3 per cent. to produce the effect upon the carbon as to color of the casting which was produced by the 1 per cent. of aluminium. In taking away the tendency to chill, 1 per cent. of aluminium left $\frac{1}{4}$ inch chill, while 2 per cent. and even 3 per cent. of silicon was required to bring it down to $\frac{1}{8}$ inch.

I stated in my paper that "silicon and aluminium work together in the same direction," but all of my experiments prove that with this white iron such small percentages of silicon as he mentions produce no appreciable effect upon grain, chill, shrinkage or fluidity, and that until about 1 per cent. of silicon is added the result is not sufficient to be seen, and then not enough to be measured. Understanding perfectly the effect of silicon on this white iron, I knew that even 0.44 per cent. would not influence the metal enough to affect the measured results of the influence of aluminium.

I do not think it can be proved by experiment that this small percentage of silicon which he names would produce the effect that he claims—or, in fact, any effect whatever—although by inference we have a right to assume that any amount of silicon does produce a corresponding effect. I endeavored in my paper to state plainly that the crucible might give up or the metal be deprived of much larger percentages of silicon than he mentions, and that, therefore, on account of these errors in the most carefully conducted experiments, none but general conclusions can be drawn. The error due to these small percentages of silicon, added with the aluminium, is less than the error I have spoken of, and neither of them alone, or added together, is sufficient to materially affect general results.

The gray iron that I use for tests has its carbon on the balance that he speaks of, and for delicate tests I use this iron. It was to this and not to the white iron that I added the 4 per cent. of aluminium. It gives $\frac{1}{4}$ inch chill; 3 per cent. of aluminium took out all chill, but with twice that amount of silicon there still remains a chill. So far as blowholes are concerned,

some of the effects of small percentages of silicon may be measured by the increase in strength to resist weight and impact. What my experiments prove, is that aluminium acts in this manner.

In the short time that I had at my disposal I treated only of the influence of aluminium. When Mr. Hammer calls for a publication of more facts, does he not forget that he has met the facts that I have already published by mere suppositions? I shall soon be ready to publish the results of a very large number of carefully made tests, to show the influence of silicon upon cast iron. And, in the meantime, if I have not given a complete answer to the objections raised, I shall endeavor to give further information.

W. J. KEEP.

OBITUARY.

C. P. BUCKINGHAM.

Gen. Cartherinus P. Buckingham, president of the Chicago Steel Works, of Chicago, died at his residence in that city on the 30th ult., after a brief illness. He was born in 1808 at a small village called Springfield, near Zanesville, in Muskingum County, Ohio. His father was a merchant, and his mother was Catharine Putnam, daughter of Gen. Rufus Putnam. He graduated from the United States Military Academy at West Point in 1829, standing third in a class of exceptionally bright students. Entering the Topographical Corps of the Army, he was detailed after a year's service to West Point as Assistant Professor of Natural Philosophy, which position he resigned a year later to fill the chair of natural philosophy in Kenyon College, at Gambier, Ohio. He removed to Chicago in 1856, and in connection with Solomon Sturges built the Illinois Central grain elevators. In 1861 he re-entered the United States Army, was made Brigadier-General, and was selected to perform delicate and important functions in connection with raising troops, locating arsenals, &c. He resigned shortly before the close of the war and for several years was engaged in the elevator business in Brooklyn, N. Y., removing to Chicago in 1868 to assist his brothers John and Ebenezer in managing the elevators he had himself built. In 1873 he and his brothers established the Chicago Steel Works, which have been successfully operated by them from that time until the present. These works are among the few mills in the country making a specialty of manipulating old steel rails and putting them into merchantable shapes, for which they use machinery of original and very ingenious design. Under General Buckingham's active supervision, with the cordial co-operation of his brothers, this machinery was perfected and the works have steadily grown in importance, their products being used in the leading plow and other agricultural manufactories throughout the West.

Reports of the Edinburgh meeting of the Iron and Steel Institute, just at hand, show that, as expected, no matters of startling interest came up. The most valuable paper presented was that of R. A. Hadfield, of Sheffield, on the manganese steel with which his name is coupled, and a description by Daniel Adamson of a testing machine. A number of Americans took part in the discussions, among them T. C. Clark, of the Union Bridge Company; Capt W. R. Jones, of the Edgar Thomson and Homestead Steel Works, and Dr. T. Sterry Hunt. The latter spoke, too, in reference to the proposed meeting in this country, but as the institute is to go to Paris next year, the visit has been further postponed.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., September 4, 1888.

The caucus of the Republican Senators has materially changed the programme of that wing of the higher branch of Congress. At the gathering at Senator Edmunds's residence last Wednesday night, it was determined to shorten the time for hearing of representatives of the industrial interests to ten days, and the Subcommittee on Finance have since been faithfully working up to that point. It is now confidently expected that the whole bill will be reported to the full committee by next Tuesday. Senator Beck, though next to Senator Voorhes on the Democratic side of the committee, is really the active leader on the tariff. He said to-day that he could not say what the policy of his side of the committee would be on the bill when reported there, for the reason that the Republicans had not yet permitted them to see it, nor had they said anything to them as regards even an outline of the measure. He said it might only receive a *pro forma* opposition in committee, reserving the main contest for the floor of the Senate. He said he would know more about that after he examined the bill. He admits that there will be a lengthy discussion in the Senate. The Democrats there will stand upon the platform of the Mills bill and will attempt to show that it is not a free trade measure, nor a stride in that direction, but purely a movement to reduce the revenue.

The bill as it stands makes no material changes in the metal schedule neither in raising duties where they should be nor lowering them where it can be done. Steel rails are scheduled down to \$15, but even this may be changed. The chief grounds of difference have been on the lumber, wool and sugar schedules. An increase of duty of one cent on the finer grades of wool has been assented to in the subcommittee, and lumber has been allowed to remain unchanged, but sugar comes in for a 50 per cent. cut, which is objected to by the Kansas Senators on account of the sorghum interests of their State. The sugar reduction would foot up but \$30,000,000, and the balance of the reductions proposed would be more likely to increase than decrease the revenues, so that the rest must come from internal revenue. Senator Allison says that the bill which will be reported will receive the united support of the Republicans, but the length of the debate and the time of its passage will depend largely upon the course of the Democrats. They will be accorded full swing in discussion, and when they get through a vote will be taken.

The passage of the bill in the Senate will be followed by conferences and non-concurrences, which will depend entirely on the amount of time consumed upon the obstinacy of the conferees and the disposition of the two Houses to enter into much of a debate on the conference reports. After one or two disagreements the House may refuse to appoint conferees, which will bring matters to a standstill. This may lead to a recess or an adjournment some time in October. The tariff question is remote from being settled as far as legislation in this Congress is concerned. It is more likely that the representatives now in nomination for election to the Fiftieth Congress will have that knotty question to deal with. The 6th of November will determine whether Mr. Mills or a Republican committee will prepare the bill for that Congress to dispose of, and whether Grover Cleveland or Benjamin Harrison will exercise the Presidential power of approval or veto.

Recent Legal Decisions.

PROMISSORY NOTE—PAYMENTS MADE TO AGENTS.

Q. gave his note for \$800 to H., but did not pay it, and H. placed it in T.'s hands for collection. T. was a lawyer, and in the course of the month H. advanced more money to Q., and took a note for the whole sum due. Q. fell into the habit of paying the interest on the note to T., though the note was made payable at the Bank of California, and he, also, made a payment on account of the principal to him, all of which payments were sent to the Bank of California. The payment on the principal was credited on the note but the interest was not indorsed. T. did not have the note in his possession when the payments were made, but H. knew that Q. was making the payments under the impression that T. was still his agent. H. transferred the note to his daughter, after its maturity, but did not give Q. any notice that he had done so. Suit was brought to enforce the payment of the note, and Q. sued to restrain its collection, he having paid in full to T., but he was defeated. H. carried the case—*Quinn vs. Dresbach*,—to the Supreme Court of California, where the judgment was reversed. Judge Hayn (of the Commission of Appeals), in the opinion, said: "It was negligence in H. to allow Q. to act in the belief that T. was authorized to receive payments on the note. He, H., knew that T. was acting in some way as his agent in making these collections, for the bank knew this, and the knowledge of the bank, which was H.'s agent, must be imputed to him. Here T. had ostensible authority to act for H.; it would not be supposed by H. that he was acting for Q. Ostensible authority is defined to be 'such authority as a principal, intentionally, or by want of ordinary care, causes or allows a third person to believe his agent to possess.' The fact that the note was not in the possession of T. does not change the result. The want of this possession is a circumstance to be considered in determining the question of authority, but is not conclusive. The fact that the bank held the note for collection would not prevent the owner from collecting it himself. And the transfer to H.'s daughter gave her no right, the note having matured, her father did not have, as no notice thereof was given to Q. The judgment must be reversed."

PROTEST—PRESENTMENT.

M. H. and T. H. made their note March 11, 1884, payable in 10 months, with F. as nominal payee, E. being the actual payee. E. indorsed the note, and both he and F. put over their names "waive notice and protest." The note was dated at Belleville, Kan., but the H.'s did not live at Belleville, nor did they receive their mail there. The note was not paid, and in the certificate of protest it was stated that the note was presented to the H.'s at Belleville for payment, and that it had been refused; that notice of dishonor had been sent to the H.'s in an envelope, postpaid, directed to Seape and Concordia, Kansas, respectively, and that at the same time the same notice was sent to E., directed to Belleville. E.'s post office address was not known, and, in fact, neither he nor the H.'s got the notices sent. An action was brought on the note against E. and the H.'s, and E. depended on the ground that there had been no demand made on the H.'s and that he had had no notice of dishonor. Plaintiff had judgment, and E. carried the case—*Davis vs. Eppher*—to the Supreme Court of Kansas, where there was an affirmation. Judge Holt (of the Commission of Appeals), in the opinion, said: "1. The residence of the maker

being unknown, it was sufficient that the note was ready for presentment at the place where it was made. 2. Notice was properly sent to E., at Belleville, his residence not being known. 3. The waiving of notice and protest made the indorsers absolutely liable without protest or notice."

INNKEEPER—LIEN ON GOODS OF DRUMMER.

D. was the traveling salesman or "drummer" of N., and he carried with him trunks and packages of samples of the goods he was selling. He stopped at the hotel of C. and there ran up a bill of board, on which, from time to time, he made payments. The account was extended over the greater part of the year. No information reached N. of D.'s default in payment until after the debt was incurred, when he found that the innkeeper held the samples under claim of a lien thereon, on the ground that N. was liable for the bill, as it was made by D. in the course of the work done for N., as his agent. N. had recovered the sample goods in an action therefor. N. refused to pay the balance of D.'s bill when C. demanded payment, and an action was brought therefor—*Covington vs. Newberger*—and the plaintiff recovered. N. carried the case to the Supreme Court of North Carolina, where the judgment was reversed. Judge Davis, in the opinion, said: "The plaintiff relies upon the implied promise of the defendant to pay this debt. He seeks to establish his liability by the rule that where a principal sends his agent through the country to sell goods for him the principal gives the agent, by implication, authority to bind him for all charges incurred in the performance of his duties. Conceding this rule to be well settled, can it be easily assumed that it is within the scope of the agent's authority to make debts and charge his principal therewith? He was employed to sell goods, and it may be that all reasonable and necessary expenses (whether he be furnished with the money by his principal to pay or not) as he travels through the country may be an implied charge against his principal as a necessary incident to the business of the agency; but this must be within the limits and subordinate to a well-known custom. But the plaintiff has testified that it was the general custom of transient patrons, as D. was, to pay cash for their bills. There were exceptions, he said, but he did not show that this case was an exception. The long and continued failure of D. to pay his bills for board in full, according to the general custom, ought to have put plaintiff on inquiry; and he should have gone to his principal with notice, else he put himself open to the charge of collusion with the agent against the principal. It is insisted by plaintiff's counsel that if he cannot hold N. for the debt, still plaintiff had a lien on the goods in possession of D. for the hotel charges, he being a guest, unless he knew the goods to be the property of another. But assuming that plaintiff had notified the defendant that his agent had failed to pay for his bill, and assuming that a lien would then arise to bind the goods for the bill, still, if the innkeeper allowed the agent to take the goods away, though he brought them back again, and extended the credit given for board from time to time to the agent, as the amount here indicates, he would have no lien for the amount of the unauthorized credit on the goods of the principal. The judgment was reversed."

ACCOUNT STATED—MISTAKES—DELAY IN OBJECTING.

H. rendered to M. his account against him, and the latter held the account without objection for three months. An action was brought to recover the balance stated to be due, and M., in his defense, attempted to show that mistakes had been made in stating the account; but the Court ruled against this evidence, and H.

recovered a judgment. The case—*Hendy vs. March*—was carried to the Supreme Court of California, where the judgment was affirmed. The case was decided by the Commission of Appeals, the judgment of which was approved by the Supreme Court. Commissioner Hayne, in the opinion, said: "The delay of three months to object to the account is a sufficient acquiescence in its correctness, and such acquiescence is an admission that the account is correct. Between merchants at home an account which has been presented, and no objection made thereto, after the lapse of several posts, is treated, under ordinary circumstances, as being by acquiescence, stated account, and between merchants in different countries a rule founded on similar considerations prevails. But the defendant contends that even if this is the case, he is entitled to show mistakes made in stating the account. The answer to this is this: An account stated becomes a contract, for an account stated alters the nature of the original indebtedness, and is itself in the nature of a new promise or undertaking. Therefore, an account stated with a new firm may include debts due to a former firm, or to one of the partners. An action upon an account stated is not founded upon the original items, but upon the balance ascertained by the mutual consent of the debtors and creditors. If there is any mistake in the contract thus created it must be made, as in any other case, an issue in the pleadings, and tried upon that issue; it cannot be shown as a defense to the original indebtedness."

PARTNERSHIP—FRAUDULENT CONVEYANCE BY PARTNER OF HIS OWN PROPERTY.

S. & R., merchants, were indebted to S., S. & Co. for goods sold and delivered to them, and they became insolvent. S., one of the debtor firm, conveyed to J. J. S., who acted in good faith, certain land, in consideration that he would pay his individual creditors \$3500, the amount of their claims, they accepting J. J. S. as their debtor for S.'s debts. The property had a possible value of \$4600, or \$1000 in excess of the consideration got. S., S. & Co. brought suit to set aside this conveyance as fraudulent as to them as creditors, and they had judgment. The defendants made a case on appeal, *Smith vs. Sely*, to the Supreme Court of Indiana, where the judgment was reversed. The chief justice (Mitchell), in the opinion, said: "When it is established that a grantee has taken a conveyance of a debtor's property under circumstances which make him guilty of positive fraud, and the transaction is fraudulent in fact, the conveyance will be deemed absolutely void as to the grantor's creditors, and will not be permitted to stand even as an indemnity for any payment the grantee may have made. If, however, a court of equity finds that property has been purchased from a failing debtor without any positive fraud upon the part of the purchaser, and yet under such circumstances as make it a highly injurious act and inequitable as to creditors that the conveyance should stand as a conveyance, it may be set aside on such terms as will protect a purchaser whose purchase is only constructively fraudulent. In the one case the transaction is fraudulent in fact, and the conveyance is utterly void as to creditors, and cannot be permitted to stand for any purpose; in the other the conveyance is fraudulent by construction of law, and is set aside upon consideration of public policy only, and then upon the condition that the equities of the purchaser, who was guilty of no actual fraud, be protected. The conveyance in this case, if fraudulent at all, is constructively fraudulent only; and equity must be done to the grantee. It is our opinion that the conveyance should not be disturbed. There was but a barely possible margin of \$1100 on the property, taking the highest esti-

mated value, and when we consider that an honest debtor in embarrassed circumstances is sometimes compelled to sell real estate under its value, and that honest purchasers are not compelled to pay the highest value possible, we are unwilling to concur in the conclusion arrived at by the court below, that the conveyance ought to be set aside as constructively fraudulent.

Mill Roofs.

Although the constructive features of mill roofs are well defined there is a wide diversity of experience and opinion with regard to roof covering. The extract which we give below, from a lecture on "The Evolution of the Modern Mill," delivered a short time ago by C. J. H. Woodbury at Sibley College, will therefore prove specially interesting.

The present form of factory roofing, says Mr. Woodbury, resembles a floor in its construction, being made in a similar manner of plank laid upon beams which project through the walls, where they act as a bracket to the cornice, the ends being sawed after any suitable ornamentation. The inclination for such roofs is about $\frac{1}{4}$ inch to the foot. Where a mill is narrow enough for a single beam to reach from the wall to the ridge they form cantilevers, the second point of support from the wall being by the columns one-third of the distance across the mill, and the ends of the beams are further secured together by means of iron dogs. For mills of greater width the beam would reach only to the row of columns, and over the middle of the mill a beam is placed, usually horizontal on the under side, and hewn down from the middle to each end, so as to preserve the same slope on the upper side of the beam as for the roof. In many instances mills are built with brick cornices, without any of the wood projection from the side, and in other buildings the walls are carried above the roof, which slopes toward the center, and all water falling on it or melted from the snow is conducted from it by pipes leading down through the middle of the mill. It is not desirable to place gutters around the edge of the mill as they serve no useful purpose and are in continual need of repairs. By leaving the edge of the mill plank square and protecting it by sheet metal flashing the rain falling from the roof can be received by a concave walk of coal tar concrete placed on the ground around the building. Suitable porches over doors, or some guard on the roof at these points, will prevent people who may be passing in at doors from being unduly wet by water from the roof.

There are numerous forms of roof coverings, the use of the different varieties being to a great extent local—that is, the sheet-iron coverings used in the Middle States are almost unknown in New England, and in the latter place the ordinary tinned iron roofing is universally painted, while in the Dominion of Canada it is laid obliquely and never painted. It is conceded by all that the sheet copper forms the most desirable method of covering a roof, and if one could be assured of the permanence of the structure, irrespective of the necessity for making changes every half year in order to keep pace with the march of invention, it would doubtless be shown that under such conditions of permanency copper would form the cheapest roof. The most widely used roofing materials for this class of buildings are the asphalt and the coal-tar roof, the latter being the most widely used in New England. There are numerous varieties of these composition coverings, which are applied by various methods. Some of these are of the most satisfactory character, while others are poorly designed and unskillfully

applied, and are a constant source of trouble and expense to the occupant of the building.

One of the leading manufacturers, the efficiency of whose work for many years over a large amount of mill property I can vouch for by personal knowledge, uses the following method of applying the roofing: Three layers of roofing felt are placed on the plank parallel to the eaves, and continued by lapping each additional layer two-thirds of its width upon the preceding one, and in this manner covering the roof with three thicknesses of the felt, breaking joints. This is secured to the roof by nails through tin washers and coated with a melted composition, and then two additional layers of felt are placed over the whole. Another coat of composition is then applied and gravel is placed over the whole while soft. This maker does not approve of the practice of cementing each sheet of felt when it is laid, because it does not allow the felt freedom to yield from the expansion and contraction of the roof. When tin is applied to roofs, rosin-sized building paper should first be laid on the roof plank, and the sheets of tin should be painted on the lower side before being laid.

Of late years cotton duck has been applied as a roof covering, and has been watched with a great deal of anticipation, although it has been used for similar purposes in covering ships' decks for many years. But the two uses are not strictly comparable, because the ship's deck is calked tight, and therefore the covering is free from the application of moisture underneath, while the roof is never tight, and the warm air underneath, heavily charged with moisture, which permeates the cracks between the planks, becomes chilled and condenses as it nears the top, carrying on a process of distillation. As an example of the extent to which this can be carried on, I have known of instances where people presumed they were making a good roof by leaving slight air spaces by means of the furring laid between the roof plank and the top boarding. The circulation of air in these spaces deposited sufficient moisture to rot the boards. A mill manager, wishing to have a roof over a very warm room, which should be both tight and a very perfect non-conductor, made a roof containing a space of about 16 inches, which was filled with sawdust, and the roof boarding on top of this was covered with tar and gravel in the usual manner. In a few weeks the water began to drip through the ceiling as if the roof was leaking, although there was no snow on the top of the roof. Investigation showed that within that short time a sufficient amount of water had condensed with the sawdust to saturate the whole. I would say in this connection that 3 inches of plank afford an ample protection against condensation over any ordinary processes of manufacture, although 4 inches of plank have been used as a roof over paper machines in order to be safe beyond peradventure; but it is necessary that nails should not be driven into the bottom of this roof plank, because the point of a nail will reach to a lower temperature near the outside of the roof in the winter, and being a better conductor, it will cause moisture to condense upon the head of the nail.

Tin roofing is so general in use as not to require any allusion to methods of application, but the only course to reach economical and satisfactory results for a term of years, especially for locations near to the seashore, is to use the best quality of dipped roofing plates of some brand which can be relied on as conforming to the standard and free from "wasters" or imperfect plates. Duck roofing has been successfully applied by first laying and tacking down a covering of two-ply asphalt paper, and upon this was spread a

covering of rosin-sized sheathing paper, tacked in the usual manner. Upon this was laid a covering consisting of cotton duck, 44 inches wide and weighing 28 ounces to the yard. Several methods of joining the edges of the duck together have been tried, resulting in the abandonment of the method of sewing used, for the preferable method of nailing the duck down, laying one strip over the other, and then opening the duck, a lock joint is formed without any jointure between the two sheets exposed to the weather. After the duck is stretched on the roof, it is securely fastened by means of round-headed woodscrews, $1\frac{1}{4}$ inches long, through a concave tin washer $\frac{1}{2}$ -inch in diameter, resting upon a $\frac{1}{4}$ -inch washer made of roofing felt. A coat of hot pine tar with a small quantity of linseed oil is laid upon the whole of the duck roofing, after being laid, for the purpose of filling the fiber and preserving the cotton fabric by means of the antiseptic principles of the pine tar. The surface is then covered with two coats of mineral paint.

Within a year paper has been very successfully used as a roof covering. Sheets of wood pulp board about $\frac{1}{4}$ inch in thickness are treated by a process which renders them hard and elastic, and secured upon the roof by means of tacks through concave tin washers. The edge of each sheet is grooved, in order to allow for the expansion and contraction of the roof. The whole roof is then covered with a heavy mineral paint. Experience with this during the past severe winter in Maine has been of the most satisfactory nature. Shingles furnish a much better roof covering than slate, both in the matter of conduction of heat or cold in the extremes of summer and winter and also in resistance to fire. The heat of a slight fire underneath the roof will cause slates to crumble, and the same result will be obtained by heavy sparks falling and burning upon the roof. Some people treat shingles by boiling them under pressure in a solution of salt and chloride of lime for the purpose of antiseptic treatment and also to render them fireproof.

A better class of sugar machinery is much needed in some parts of Brazil, where, as a rule, the machinery employed for extracting the sugar is of a very primitive description, and although the sugar-cane contains 14 to 16 per cent. of saccharine, the manufacturers often obtain no more than 6 per cent. Lately, however, owing to the competition of beet-root sugar, the want of improved machinery has been very keenly felt, and here and there large establishments are springing up furnished with modern machinery, which has been mostly imported from France. These companies are generally formed with a capital of 1,000,000 francs to 1,500,000 francs, and, notwithstanding the low prices of sugar, are able to pay a dividend of about 10 per cent.

Minneapolis claims to be the champion wheat depository of the Northwest. The receipts at that point for the crop year ending August 31 were 47,109,490 bushels. This is said to be the largest quantity of wheat ever received in any primary market in the world. When it was announced last year that 39,278,380 bushels had been received in Minneapolis it was said the record would never be equaled. This year the increase is 7,831,110 bushels.

Three important industrial exhibitions open in the West this week. Columbus, Ohio, led off with its Centennial on Tuesday, followed the next day by the opening of the annual exhibitions at Chicago and Milwaukee. Exceptionally attractive features are announced at all of them.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., September 4, 1888.

Pig Iron.—The market has shown a considerable amount of firmness during the past week, and, while prices show no quotable change, the tendency is gradually in the direction of higher figures. Scarcity is perhaps the most prominent feature of the market. There is a disposition to sell within moderate limits and not much of a desire to force a higher range of prices. The conditions are such that any slight falling off in other markets would immediately influence us, hence Philadelphia is inclined to follow an advance rather than to lead one. In the meantime prices are relatively as low, if not lower, than in almost any other market, so that holders, as may be expected, are very firm. There is no urgent demand; consumers are taking 30 or 60 days' supplies at current rates, which is about as much as sellers are willing to enter for the present. Bids at current rates have been made in some cases for lots deliverable during the next six months, but they have not been taken into serious consideration. There is evidently more interest manifested in the market than for a long time past, and while most people expect an improving condition of affairs, there is not much chance of any material advance in prices. It is thought that 50¢ to \$1 per ton would bring in a good many furnaces, and those who are now in blast are not disposed to make a market, which would, perhaps, only lead to a higher cost and increasing competition, without any corresponding increase in consumption. Of course, if the position really calls for a larger production it will be impossible to prevent an advance in prices, but the trade are not inclined to make advances until it is seen that they are fully warranted. Meanwhile sales are being made at about last week's prices, say \$16 @ \$16.50 for Gray Forge, \$17 @ \$17.50 for No. 2 Foundry and \$18 @ \$19 for No. 1, tidewater delivery, or its equivalent. Nothing doing in Southern Irons; the much-talked-of cargo of 2000 tons, recently delivered at this point, was chiefly to close an old contract made by Justice Cox, Jr., & Co. for one of the large Pipe concerns in New Jersey.

Foreign Iron.—Nothing doing in this department, although consumers are manifesting some interest in the matter. Asking prices remain as follows: \$19.50 @ \$20 for Bessemer, c.i.f. duty paid.

Blooms.—A fair average business is doing, but without change in prices, which are about as follows: Nail Slabs, \$28.50 @ \$29.50; Billets from \$30 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 per "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29 @ \$30 for Nail Slabs; \$31.50 @ \$32.50 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—The market has been very active, with sales at prices ranging all the way from \$27.50 to \$28, delivered. Mills are now nearly all sold close up, and quotations are said to be from \$28.50 to \$29, delivered, although it remains to be seen what buyers will do in the matter. Bids of \$28 have been declined, however, and the position seems to be very strong.

Bar Iron.—The demand has been increasing for some time, until at last prices are beginning to respond to the improved condition of affairs. There is still a great

lack of uniformity in quotations, but they average an advance of pretty nearly a tenth, compared with those made two or three weeks ago, and from present appearances the improvement is likely to be maintained. There is nothing spasmodic in the demand, nothing specially large in any particular line, but from all sources orders come in a steady flow, indicating a generally satisfactory consumption in all departments. It is not unlikely, however, that the demand for Skelp Iron has been of considerable advantage to some of the local mills, most of which are now pretty well filled up for several weeks to come. A very similar condition of affairs is also said to prevail in the interior, so that new business is not run after as it was some time ago. For the same reason buyers find that prices are higher, and, while no large orders have been taken at any material advance, sellers are not disposed to accept business without securing some concessions in their favor. On the whole, the impression is that prices have touched bottom, and with favorable developments during the next two weeks it is not improbable that still further advances may be demanded. As already stated, quotations are very irregular, but most of the leading mills quote 1.85¢ @ 1.9¢ for Best Refined Bars, and are said to be very firm. Others however, whose make of Iron is not as well known, might perhaps shade a fraction, but the general tone is one of strength and firmness. Large sales of Skelp Iron have been made at 1.8¢ @ 1.82½¢ for grooved, and 1.9 @ 2¢ for sheared, but higher figures are asked on new business.

Plate and Tank Iron.—The demand is improving and sellers are showing more firmness than they have for several weeks past. No specially large orders are on the market, but there is a good general demand and the outlook is said to indicate a still larger business as the season advances. Mills are not heavily loaded with work, but they seem to have all they can handle from week to week, and with still better prospects ahead there is a disposition to ask a little more money, or on specially desirable orders to hold firm at last week's prices, which are about as follow: Ordinary Plate and Tank Iron, 2¢ @ 2.10¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—A somewhat better demand is reported for small lots, but there is nothing of importance on the market. Mills are moderately busy on specifications to complete old contracts, and it is said that prospects for new work are fairly encouraging, but there is nothing very definite at present. Prices firm as last quoted, viz.: 2.10¢ @ 2.15¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.8¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The demand is very irregular. Some mills appear to have plenty of work, while others report quite the reverse. Prices show similar irregularity, but for small lots, of best makes, quotations are about as follows:

Best Refined, Nos. 26, 27 and 28....3¼ @ 3½¢
Best Refined, Nos. 18 to 25....3 @ 3½¢
Common, ½¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28....4¼ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25....4 @ 4½¢
Best Bloom Sheets, Nos. 16 to 21....3½ @ 3¾¢
Blue Annealed.....2.8 @ 3 ¢
Best Bloom, Galvanized, discount.....62½ ¢
Common, discount.....67½ ¢

Merchant Steel.—The demand has fallen off somewhat since our last report, although the mills are well supplied with orders. Inquiries are numerous, more especially for the finer grades of Steel. Prices are firm at last week's quotations, viz.: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Open-Hearth

Ordinary Spring, 2.7¢ @ 2.9¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—A better feeling is reported in this department, and it is thought that prices are held with more confidence. Sales have been chiefly in small lots at \$29 @ \$29.50, at mill, and \$29 is said to be an inside figure for the very best class of orders. There is more inquiry than usual, and the outlook generally is considered to indicate an early improvement.

Old Rails.—It is hardly worth quoting this market, as there are no Rails for sale, although it is likely that \$21.50 @ \$22 would be paid for T's, spot or to arrive. But there are none for sale at anything near these figures, so that buyers will probably fill their requirements elsewhere.

Scrap Iron.—Increasing firmness may be noted, with prices about as follows: \$19.50 @ \$20.50 for cargo lots; \$20.50 @ \$21 for carload lots, delivered, or for choice \$21.50 @ \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$19 @ \$20; Cast Scrap, \$14 @ \$15; do. Borings, \$9 @ \$10; Old Fish Plates, \$24 @ \$25. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—Mills report a full complement of orders, and are likely to be well employed until the close of the year. Prices continue droopy, however, and it is difficult to quote with any degree of accuracy. Discounts are quoted as follows: Black Butt-Welded, 55 ¢; on Galvanized do., 45 ¢; on Black Lap-Welded, 65 ¢; on Galvanized do., 52½ ¢; on Boiler Tubes, 60 ¢.

Nails.—A very general improvement is noticeable in this department. Mills are all busy and their product is being marketed without ruinous cutting of price, which has been the custom for some months past. Orders for future delivery at present price are being refused, and with light stocks and increasing demand, manufacturers have some ground to expect an advance in price. At the moment lots from store are quoted at \$2, with the usual discount on carload lots.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, September 3, 1888.

Pig Iron.—The majority of furnace agents and dealers report a quiet week but a few are still enjoying a good trade. The latter class comprise those who have some brands of Iron to dispose of at current prices. They are being sought for by consumers who were disinclined to believe the reports they heard about the increased demand for Pig Iron and the hardening of prices. Some large buyers are included among the number, and their purchases have caused more furnace companies than were previously reported to retire from this market, having sold all the Iron they cared to place at present prices. Makers are undoubtedly attempting, though not through any concerted arrangement, to advance their rates, but the success of their efforts will depend on contingencies, prominent among which is the revival of the demand for all classes of material from the railroad companies. About Southern Coke and Lake Superior Coke Irons, however, there is no doubt, as prices have already been marked up. We quote for cash as follows: Lake Superior Charcoal, all numbers, \$19.50 @ \$20; Alabama Car-Wheel, \$26.25; Southern Charcoal Foundry, No. 2, \$18.50 @ \$20; Jackson County Softeners, No. 1, \$18.25 @ \$18.75; Hocking Valley, Soft Foundry, No. 1, \$17 @ \$18; American Scotch (Blackband) No. 1, \$18.50 @ \$19.50; other Ohio Scotch Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$17.50 @ \$18.50; No. 2, \$16.50 @ \$17.50;

No. 3, \$15.50 @ \$16.50; Southern Coke, No. 2, \$17.75 @ \$18; No. 2½ and Open Bright, \$17 @ \$17.50; No. 3, \$16.50 @ \$17.

Bar Iron.—An undoubted improvement in the general demand leads to the presumption that the commencement of fall business has set in. Manufacturers' agents report numerous inquiries from miscellaneous consumers, and sales have been made at 1.70¢ @ 1.72½¢, f.o.b. Chicago, half extras, for Common Iron. The demand is largely local at present, but the upward tendency in prices will probably soon enlarge the circle of purchasers. Contracts for cars have been placed to some extent, and the consumption of Bar Iron is expected to show a decided increase in that direction very shortly. The quotations now being made by the mills are for immediate acceptance, everything in the nature of options having been withdrawn. Sales agents complain of the uncertainty which this condition of affairs imposes on them, as they are equally solicitous of protecting their customers and pleasing their principals. Jobbers quote 1.80¢ @ 2¢, from store, according to quantity and quality.

Structural Iron.—A good week's business has been done in bridge work. The heaviest single contract in this line was taken by the Chicago Forge and Bolt Company, who bid \$40,950 for the Fifth avenue approach to the Twelfth street viaduct in this city. Competing bids ranged from \$43,900 to \$48,789. The demand for Beams is declining with the approaching close of the building season. Prices are very firm at previous quotations, carloads of Angles from mill being held at 2.20¢, f.o.b. Chicago; Universal Plates, 2.30¢; Tees, 2.45¢; Beams and Channels, 3.40¢. Store prices are as follows: Angles, 2.40¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢.

Plates, Tubes, &c.—Few mill orders have appeared in the market recently, but the jobbing trade has been very satisfactory. The territory covered by the Chicago dealers is growing again, restrictive influences, which were temporarily exerted, having disappeared. No changes in prices are reported, but the whole list is firm. Store prices are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 8.75¢; Boiler Tubes, 60 % and 65 % off on 2½-inch and larger, according to specifications, and 62½ % off on 2-inch and smaller.

Sheet Iron.—Good-sized orders are still to be picked up in this market by mills able to handle them, but great difficulty is experienced in finding the mills willing to contract for deliveries earlier than November or December. Jobbers have again advanced their prices and now quote small lots of No. 24 at 3.30¢, Nos. 25 and 26 at 3.20¢ and No. 27 at 3.30¢, with a slight concession to best buyers.

Galvanized Iron.—Although manufacturers' agents report a sufficiently active demand to keep their stocks very low, and the mills are unable to increase their shipments in this direction because of a similarly strong demand from other districts, yet the price does not improve. It is expected that an upward movement will take place before long, however, if values of other Iron and Steel products continue to appreciate. Quotations are as follows for small lots: Juniata, 60 and 10 % off; Charcoal, 60, 10 and 5 % off.

Merchant Steel.—Nothing of special interest has occurred in this branch of trade. Stores report an excellent movement in small lots. They quote as follows: Bessemer Bars, 2.80¢ @ 2.40¢;

Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Increased inquiry is reported, and a few sales of 500 to 2000 tons each have been made. The high price of Old Iron Rails has already induced some railroad companies, which have been practicing rigid economy this summer, to take up a considerable length of old track and relay it with new Steel Rails while they can be had at such low prices as are now ruling. The mills could probably sell many more Rails if they were not so manifestly eager for business. Their weakness inclines the railroad companies to defer purchasing until they are absolutely sure that the bottom has been touched. It is possible that they may hesitate too long, in view of the upward movement in prices of other Iron and Steel products. Quotations now range from \$30 to \$31, according to quantity.

Old Rails and Wheels.—The available supply of Old Iron Rails is quite limited. Although railroad companies are now taking up Old Rails quite freely, on account of their advance in price, a spirit of speculation has developed, and considerable quantities are being withdrawn from the market to be disposed of when higher figures are reached. It is reported that \$25.25 was refused by a dealer who expects to sell at \$26. Sales of several thousand tons were made earlier in the week between \$23 and \$24. Consumers insist that they will not pay more than this, but they so expressed themselves when Old Rails had advanced to \$20. Sales of Old Car-Wheels are reported at \$19, but they are not to be had in quantity at that price.

Scrap.—Consumers are looking about more freely for Forge Scrap, which is not in excessive supply, and they find dealers indisposed to sell more than moderate quantities, for which they ask higher prices. Some name \$20 for strictly No. 1 Railroad Shop, reporting actual sales at \$19.50, net ton. The demand for Mill Iron is fair. Cast and Steel Scrap are both quiet. Fish Plates are higher, in sympathy with Old Rails, sales having been made at \$20 @ \$20.50, net ton. Dealers offer \$13 @ \$14 for Mixed Country Scrap. Selling quotations for carefully selected are as follows, per ton of 2000 lb: No. 1 Forge or Railroad Shop, \$19 @ \$19.50; Track, \$18.50; No. 1 Mill, \$15 @ \$15.50; Light Wrought, \$11; Horseshoes, \$18; Axles, \$25; Cast Machinery, \$18.50 @ \$14; Stove Plate, \$11; Cast Borings, \$9; Wrought Turnings, \$11; Axle Turnings, \$13; Coil and Leaf Steel, \$16; Locomotive Tires, \$16.50.

Hardware.—The demand is good for both Shelf and Heavy Hardware, some houses reporting a steady improvement from week to week. Seasonable goods have moved off satisfactorily, including Tinners' stock, Stove Boards, Coal Hods and Stove Furniture generally. Carriage Bolts have been advanced 2½ %. Shot has also been marked up 10¢ per sack, \$1.40 now being asked from store.

Nails.—The advance in Cut Nails made by the Western Nail Association was immediately put in force in this market, agents asking \$2.02½, f.o.b. Chicago, for factory lots of Steel Nails. Both manufacturers' agents and jobbers had been enjoying an improved demand and the market was in good shape for an advance. A falling off in business was the immediate result, but this will probably only be temporary. As soon as it is apparent that the advance will be maintained buying will be resumed. Nails are now sold from store at \$2.10 for Steel and \$2.60 for Wire, which ought to be the price for carloads, with the present cost of factory lots.

Barb Wire.—A little movement is being felt by manufacturers and jobbers, but no large sales are reported. Nevertheless, a heavy fall trade is expected. Last year a good summer demand was experienced and no fall business. This year the conditions seem to be reversed. Prices are thoroughly demoralized. Painted is being sold at low as 2.90¢ from stock. This was brought about by the action of certain manufacturers, who cut Galvanized from the usual difference of 75¢ per 100 lb to 65¢. It immediately affected the price of Painted to the same extent.

Pig Lead.—Speculative buying has been the feature of the market here and in St. Louis the past week. One buyer is said to have absorbed nearly all the offerings, amounting to 2500 tons at both points. Prices at Chicago varied from 4½¢ early in the week to 4.60¢ @ 4.65¢ at the close.

Pittsburgh.

Office of The Iron Age, 77 Fourth Ave.,
PITTSBURGH, September 4, 1888.

The Iron and Steel industries in this district continue to improve; the volume of business is steadily increasing. Nearly all the mills are in operation, some of them working up to their full capacity, but the great trouble is to get up the prices of the products sufficiently to correspond with the greatly enhanced cost of production. Pig Iron has gone up \$2 @ \$3 per ton; Old Rails, \$3 @ \$4; Muck Bar, \$2.50 @ \$3, while Finished Iron as yet has not been advanced more than \$1 @ \$1.50 per ton. However, it is being advanced almost every day, and as long as the former continue to go up the latter will follow. In regard to the present boom the trade generally regard it as being regular and legitimate. Thus far there has been in this district an absence of speculation. There was some Pig Iron bought on speculation when the upward turn was first inaugurated early in July, but at present business in all branches of Iron and Steel is legitimate and is being conducted upon the law of supply and demand. Thus far there has been little or no improvement in the market for Steel Rails, and this is regarded as about the only weak spot apparent at present in connection with the present improvement.

Pig Iron.—The market is strong and considerably excited, and, since our last report, there has been a further advance of 50¢ to 75¢ per ton. Brokers report continued difficulty in finding sellers, as nearly all the furnaces in blast are sold from one to three months ahead; some of them have contracts that will absorb their entire product during the remainder of the present year, and they are feeling a little sore in regard thereto, as they could have done a good deal better by holding off, but they obtained full market price at the time. As compared with the lowest point, there has been an advance of \$2.20 to \$2.25 per ton on Mill Irons, and, while some well-posted operators are inclined to the belief that the zenith has been reached, others whose views are equally good look for still higher prices. There has been a decided improvement in the demand for Foundry Irons during the week under review, and it has been demonstrated that a good many foundrymen were caught napping. We quote prices as follows:

Neutral Gray Forge.....	\$15.75 @ \$16.50,	cash
All Ore Mill.....	16.75 @ 17.00,	"
No. 1 Foundry.....	17.00 @ 17.50,	"
No. 2 Foundry.....	16.25 @ 16.50,	"
No. 3 Foundry.....	15.50 @ 16.00,	"
No. 1 Charcoal Foundry.....	23.00 @ 24.00,	"
No. 2 Charcoal Foundry.....	21.00 @ 22.00,	"
Cold Blast Charcoal.....	25.00 @ 27.00,	"
Bessemer Iron.....	17.75 @ 18.50,	"

There were sales of Bessemer at \$18, cash, here and one lot reported at \$19, cash, delivered at East St. Louis. Sales

No. 1 All Ore Foundry Iron at \$17.50, cash, and All-Ore Mill at \$16.75 @ \$17, four months.

Muck Bar.—There is an active demand for Muck, with but little offering. As compared with the prices of a week ago, there has been a further advance of 50¢ per ton. So far as we have been advised there have been no sales above \$29, cash, but a further rise of 50¢ to \$1 per ton within the next week or so is expected.

Manufactured Iron.—The continued advance in Pig Iron is carrying Finished Iron up with it, and in the present condition of the market, with the raw article worth considerably more than the products, manufacturers are not disposed to make large contracts, especially for future delivery. Jobbers and large consumers, on the other hand, are anxious to anticipate future wants for the same reason that manufacturers are holding back, being apprehensive of higher prices. It is safe to say that there has been an advance of from \$1 to \$1.50 per ton on all kinds of finished Iron, and the indications are that prices will go higher, as they are still too low as compared with the cost of the raw material. Those mills using Old Rails fare still worse, as they have advanced considerably more than Pig Iron.

Nails.—There has been little or no improvement in the Nail trade as yet, and the outlook is not very encouraging. While we continue to quote card rates, and Pittsburgh makers are refusing to "cut" below, buyers, it is stated, are able to do better elsewhere. How it is that they can be sold below card rates, in view of a recent advance of \$1 per ton in the price of Nail Slabs, is one of those things that is hard to find out. Manufacturers here say they will let their factories stand idle before they will sell Nails at or below cost of production.

Wrought-Iron Pipe.—While there is not much of an improvement in the demand for Pipe, some of the mills are reported reasonably well employed, and the prices are firmer, owing largely to the enhanced cost of Pipe Iron. However, it is difficult to give reliable quotations, as each firm is still making its own rates, independently of each other. However, discounts have been reduced somewhat and are likely to go still lower, and this is causing an increased demand. General discounts on large lots appear to be 57½% on Black Butt-Welded, and 50% on Galvanized; 67½% on Black Lap-Welded, and 60% on Galvanized; Boiler Tubes, 65%; casing, 35¢ per foot net; 2-inch Oil-Well Tubing, 12½¢ net.

Old Rails.—The market continues strong, and with an active demand and very few to be had, prices have further advanced. We now quote at \$24 @ \$25 for American, an advance of \$1 to \$1.50 per ton. No sales reported. It is intimated that \$25 could probably be obtained for immediate delivery. At prices quoted foreign might be put here from the seaboard, but an advance there is probable, as it is claimed that they cannot be imported at present prices. In this market there has been an advance of \$3 to \$3.50 per ton within the past 60 days, and a good many consumers were caught napping—had no stock whatever.

Steel Rails.—There has been no improvement in the demand for Rails here, and \$30, cash, is still given as the nominal price, delivered at works. As Bessemer Iron has advanced \$10 per ton within a few weeks, it is evident that there is not much margin in Rails at present prices. It is possible that there will be an improvement before the close of the year.

Billets, &c.—Sales of Bessemer Steel Billets are reported at \$29, cash, on cars at makers' works, and the same quotation is made for Nail Slabs. Domestic Rail

and Bloom Ends quoted at \$18.50 @ \$19. Sale foreign Crop Ends at \$23.25, delivered in Pittsburgh.

Merchant Steel.—There is an improved demand, but no improvement as yet in prices. Best brands Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery, 5¢; Open Hearth, 2½¢.

Railway Track Supplies.—Spikes are firmer. Splice Bars may now be quoted at \$1.85 @ \$1.90. Track Bolts unchanged at \$2.85 with Square and \$2.95 with Hexagon Nuts.

Old Material.—Of all kinds is in demand, firmer and higher, with but little offering. No. 1 Wrought Scrap, \$20 @ \$21 per net ton; Wrought Turnings, \$13.50 @ \$14; Car Axles, \$24 @ \$25; Cast Scrap, \$15.50 @ \$16, gross; Cast Borings, \$12 @ \$12.50; Old Car-Wheels, \$20, gross.

Detroit.

WILLIAM F. JARVIS & Co., under date of September 3, report as follows: The past week has shown an active market and the inquiries received certainly indicate that a general buying movement has set in, and this, taken in connection with the action of some of the Mahoning Valley furnaces, advancing prices from 50¢ to \$1 per ton, and not anxious for orders, even at the advance, shows that a decided advance is likely to take place at any time. Lake Superior Charcoal has taken the lead, and sales aggregating several thousand tons have been made. Some good sized orders for Southern Mill Iron have also been placed in this market. Old Car-Wheels are very hard to obtain, although some sales have been made at an advance of \$1.50 per ton over prices of a month ago. We report the market active and very firm and quote as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @ \$20.50
Lake Superior Coke, all ore.....	19.75 @ 20.25
Lake Superior Coke, cinder mixed.....	18.50 @ 19.00
Standard Ohio Black Band.....	19.75 @ 20.25
Southern No. 2.....	17.75 @ 18.25
Southern Gray Forge.....	16.25 @ 16.75
Southern Silvery.....	17.00 @ 17.50
Jackson County (Ohio) Silvery.....	18.50 @ 19.00
Old Wheels.....	20.00 @ 20.50

Cleveland.

CLEVELAND, September 3, 1888.

Iron Ore.—Nearly all varieties of Bessemer Ores have advanced from 25¢ to 50¢ per ton. A round lot of No. 1 Specular and Magnetic Bessemer Ore sold during the week for \$6.25 per ton, f.o.b. cars Cleveland, and high-grade Menominee Bessemer bring readily from \$5.10 to \$5.25 per ton. Gogebic Bessemer are so closely sold up that quotations are of little value, although a few scattering sales at \$5.15 @ \$5.30 are reported. Lake freights go bounding along upward, the Ashland rate having crept up from \$1.15 to \$1.60, the Marquette rate from \$1.05 to \$1.40, and the Escanaba rate from 85¢ to \$1.20. Because of this increased cost of transportation a few important negotiations remain unclosed. Buyers hesitate before paying the advance believed by the mine owners to have been made necessary by the heavier lake freights. This fact, together with the closely-sold-up condition of the market, especially in the matter of Bessemer Ores, has kept the volume of business below that of any former week for two months or more. The market, however, is far from dull. Enough Ore is changing hands, even at the advanced quotations, to insure a most thorough clearing up of the output. Quotations f.o.b. cars, lower lake ports, are as follows:

No. 1 Specular and Magnetic Bessemer Ore.....	\$5.75 @ \$6.25
No. 1 Specular and Magnetic Non-Bessemer Ore.....	5.00 @ 5.25
Red Hematite Bessemer Ore.....	5.00 @ 5.25

Red Hematite Non-Bessemer Ore....	4.00 @ 4.25
Menominee Range Bessemer Ore....	5.00 @ 5.25
Menominee Range Non-Bessemer Ore.....	4.00 @ 4.25
Gogebic Range Bessemer Ore.....	5.00 @ 5.25

Pig Iron.—A majority of the furnaces report sales from 60 to 90 days ahead of production. This heavy demand upon the furnacemen, and the anticipated scarcity, has had the effect of advancing quotations. Lake Superior Charcoal Irons are to-day quoted at \$20.50 @ \$21.50; No. 1 Strong Foundry, Bessemer Iron, \$18 @ \$18.50; No. 2 Strong Foundry, \$16.70 @ \$17.30; No. 1 American Scotch, \$18.25 @ \$18.70; No. 2 American Scotch, \$17.20 @ \$17.70; No. 1 Soft Silvery, \$17.50 @ \$18.50; Mahoning and Shenango Valley Neutral Mill Iron, \$15.50; Mahoning and Shenango Valley Red Short Mill Iron, \$16.

Scrap Iron.—A sale of 600 tons of No. 1 Wrought Scrap has occurred. Old American Rails are selling at \$22.25 and are in fair demand. The Board of City Improvements this morning sold the 70 tons of Old Iron from the Seneca street bridge to Swatzenberg Bros. for \$18 per ton.

Louisville.

LOUISVILLE, Ky., September 3, 1888.

Pig Iron.—The demand for Iron continues steady and holders are firm. Buyers, however, are hardly willing to pay the prices asked by some of the furnaces and are yet able to supply their wants at prices current during the last week. It is evident that if the Eastern market would advance in sympathy prices would improve at least 50¢ to 75¢. To advance, however, the West will have to carry the Ohio market, which has large quantities of Iron for sale, some furnaces having stacked large blocks of Iron during the last few months, preferring to hold rather than to sell. Advances from this district to-day show that they have felt the improved market and sales have been effected at increased prices over those current during the last ten days. Large blocks of Southern Iron have not been sold, as furnaces have not the Iron to spare, many of them having taken very large orders at prices current two months ago, and are not now in position to realize on the present market. Conservative furnacemen, who were not disposed to sell for a year's delivery, as was done in many instances, now are in excellent position to reap their reward. Old Rails have advanced strongly, and are now held at \$23 with offers of \$22.75. Old Wheels are in active demand at \$20.

Southern Coke, No. 1 Foundry.....	\$17.00 @ \$18.00
" No. 2.....	16.00 @ 16.50
" No. 2½.....	15.50 @ 16.00
Hanging Rock Coke, No. 1 Foundry.....	17.25 @ 17.75
Hanging Rock Charcoal, No. 1 Foundry.....	21.00 @ 23.25
Southern Charcoal, No. 1 Foundry.....	18.00 @ 18.50
Silver Gray, different grades.....	14.50 @ 15.25
Southern Coke, No. 1 Mill, Neutral.....	14.25 @ 14.75
" No. 2.....	13.75 @ 14.25
" No. 1 " Cold Short.....	13.75 @ 14.25
" Charcoal, No. 1 Mill.....	14.50 @ 15.75
White and Mottled, different grades.....	13.00 @ 13.50
Southern Car-Wheel, standard brands.....	23.25 @ 25.25
Southern Car-Wheel, other brands.....	19.25 @ 21.25
Hanging Rock, Cold Blast.....	23.25 @ 25.25
Hanging Rock, Warm Blast.....	19.25 @ 20.25

Chattanooga.

Office of The Iron Age, Carter and 9th Sts., CHATTANOOGA, September 3, 1888.

Pig Iron.—There can be no doubt that the prices of Pig Iron are steadily on the advance. One of the best evidences of this is the fact that parties who are not consumers are getting contracts of different furnaces for round lots of 250 to 500 tons, in some cases even larger, to be delivered when called for, in monthly installments, through the balance of the year. In some cases the money is paid down at the time of the contract, while other lots are to be

paid for as delivered, and nearly all are sold f.o.b. without commissions. There is hardly a producer in the South who is not on the alert and expecting better prices to rule during the balance of the year, and, having this in view, is very cautious about selling largely for future delivery. Nos. 2 and 3 Foundry appear to be the favorite grade that is being handled in this way and the result is that the selling agents of the different furnaces are frequently without stocks to offer consumers. Should this condition of things continue any length of time it requires but little foresight to see that prices will advance considerably during the balance of the year. There are absolutely no stocks of desirable grades in the yards of any of the furnaces, and the indifference of producers to sell even at present advanced prices must certainly act as a further incentive to stiffen prices.

Cincinnati.

CINCINNATI, September 3, 1888.

Pig Iron.—The local market for Pig Iron has continued active during the past week and a strong tone has prevailed, with higher prices realized. The aggregate sales for the past week were about 30,000 tons, including orders for Mill and Foundry grades, Southern and Northern makes, off qualities, as well as standard brands. But, while the business has been of varied character and transactions "scattered," a very large proportion of the trade has been in Forge Iron of some description. And, while the majority of sales have been of Southern production, there have been increased sales of Southern Ohio, Pennsylvania and Lake Superior Iron. A feature upon which dealers lay particular stress is that special brands will now command a considerable advance over the general market, although the level has been considerably advanced during the past few weeks. The fact, also, that Softeners, Mottled, and off grades sell so much more readily, and at full prices, is cited as of particular encouragement. No. 2 Southern Foundry Iron has been sold at \$16 @ \$16.50, mainly at \$16.25; No. 1 Mill, at \$15 @ \$15.25, and No. 2, do., at \$14.50 @ \$14.75; Mottled Iron at \$13.50 @ \$13.75. There has been less movement in Car-Wheel Iron, but a fair inquiry. Individual sales have been of larger amounts, a number of 1000-ton orders having been placed and some of greater magnitude, and the prospect is favorable for the fulfillment of negotiations now in progress of several 5000-ton lots. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$17.50 @ \$18.50
Southern Coke, No. 2.....	16.50 @ 17.50
Southern Coke, No. 3.....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley.....	17.50 @ 18.50
Hanging Rock Charcoal, No. 1.....	20.50 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.50 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @ 19.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	14.75 @ 15.00
Mottled Neutral Coke.....	13.50 @ 13.75
No. 1 Mill Coke.....	15.00 @ 15.25
No. 2 Mill Coke.....	14.50 @ 14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 23.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

Manufactured Iron.—The market has gathered more strength, with more encouraging orders for all kinds. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3¼¢ @ 4¼¢ @ lb.

Nails.—There has been a quiet and easy market under free offerings without

essential change in prices. Jobbing prices are based upon 12d @ 40d, which sell at \$2 7/8 keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2 and Steel Wire Nails at \$2.65 @ \$2.75 7/8 keg.

Old Material.—A strong and buoyant tone has prevailed with a further material advance in prices. The demand for Old Rails is especially urgent, with buyers at the close at \$23, while holders ask \$24. The demand for Old Wheels has been fair, and under a light supply prices have advanced to about \$21, but there has been no trade to establish the exact market.

New York.

Office of *The Iron Age*, 66 and 68 Duane street, New York, September 5, 1888.

American Pig.—What improvement there has been in this market during the past month may be summarized in the statement that cutting has ceased almost entirely. Occasionally reports come of prices being made slightly under the market; thus a round lot of Southern No. 2 Foundry has been sold at Sing Sing at \$16.75. Representatives of Ohio furnaces report that their principals are doing better in their own territory than the figures which can be realized in this State, and the Southern furnaces, too, are getting relatively better prices in the West. Production in the South will show an increasing tendency. Among the new furnaces just completed, which are to blow in during the current month, is one of the Sloss at North Birmingham; a second De Bardeleben, at Bessemer; the Gadsden, and one or more at Sheffield. There are a fair number of inquiries in the market and a moderate amount of business is being done, with some scarcity of No. 1 being reported. We quote for standard brands of Northern Irons, \$18 @ \$18.50 for No. 1 Foundry; \$16.75 @ \$17.50 for No. 2 Foundry, and \$15.75 @ 16.25 for Gray Forge.

Scotch Pig.—The market is very dull, prices being relatively too high, compared with American Iron, to allow of the use of Scotch Pig, except where founders still conservatively retain the belief that they cannot get along without it. We quote, nominally, Coltness, \$20 @ \$20.25; Langloan, \$19.25 @ \$19.50, and Dalmellington, \$19 @ \$19.25.

Ferromanganese.—Foreign has risen above the price at which Domestic can be bought at points in the Pittsburgh district and west of that point. We quote Foreign 80 %, \$50.50 @ \$51.

Bar Iron.—The advance of Mill Iron and Muck Bar in the West, and of Old Material, is likely to soon tell on both Refined and Common Iron, and the market is showing a firmer feeling now. We quote for carload lots, half extras, on dock, 1.57½¢ @ 1.65¢ for Common; 1.65¢ @ 1.7¢ for Medium, and 1.75¢ @ 1.9¢ for Refined.

Structural Iron.—There is a better feeling, although the volume of business in this section has not increased materially. The only large order on the market is the Springfield Bridge, calling for 1500 tons of Structural Material, which is to be let to-day. We quote for round lots, on dock: Sheared Plates, 2¢ @ 2.10¢; Universal Mill Plates, 2.10¢ @ 2.15¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.7¢ and Channels and Beams, 3.3¢.

Plates.—We quote for round lots, on dock: Iron Tank, 1.9¢ @ 2¢; Shell, 2.15¢ @ 2.30¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.7¢ @ 3¢, and Fire-Box, 3.7¢ @ 4¢. Galvanized Sheets are 65 ¢ @ 65 and 5 ¢.

Steel Rails.—The market continues dull, though some of the sellers express less anxiety concerning deliveries for the winter months. They claim that their

works are fairly busy in other directions, and that relatively they are getting better prices for Slabs, Billets, &c. While this may be true of some of the Eastern mills, the representatives of the leading Western works indicate that they have very little business in sight. While usually a considerable percentage of the orders finally booked are not counted upon long ahead, still there is a dearth of work in the Northwest, the only order talked of being for a road affiliated with the Northern Pacific, for 14,000 to 16,000. A good deal of financing of securities will have to be done before many Rails can be sold. The matter is one which deeply interests the entire Iron trade. Thus far raw material has advanced independently of the Rail trade, but it may well be questioned whether this movement can progress much further until a heavier demand for Rails sets in. Rail-makers generally confess that they see no hope for a rise in the market before a good deal of winter work has been placed and of that they see no signs as yet. How far behind this year's demand has been as compared with last is shown by the fact that up to August 1, 1887, the deliveries for the year were 1,045,048 gross tons. To the same date this year they were 710,502 gross tons. We continue to quote \$28.50 @ \$29 at Eastern mill for standard sections.

Blooms and Billets.—No business in foreign material is reported, prices being relatively too high.

Wire Rods.—Only small lots are being called for. We quote \$39.50 @ \$40.

Old Rails.—The only sales during the week have been 800 tons Bridge Rails and 200 tons foreign Tees at private terms. The market is very strong, with several large orders unfilled. The supply is limited here. It is estimated that the stock here is from 8000 to 10,000 tons, of which about 3500 tons are Double Heads. For a lot of the latter, ex-store, \$24, cash, has been declined, and nothing under \$25 is entertained, and then they are not offered firm at that price. Tees, in store here, are held at \$24, though it is believed that \$23.50 might be entertained. Private cables report the c.i.f. price of Doubles at 72/6, which is equivalent to \$24.50, without any margin to importer. The price quoted for shipment is \$25 for Doubles and \$24 for Tees. The market is excited, but business is restricted by the absence of stock. The holdings here are practically in the hands of four parties, among which is a banking house, while one lot of about 2600 tons is held by a Philadelphia firm, and one round lot is held on European account. We quote \$23.50 @ \$24 for Tees and \$25 for Double Heads.

Track Material.—The advance in Old Rails has caused a stiffening in Spikes. Offers are being withdrawn, and agents have instructions not to sell anything above very small lots, which are quoted \$2.15, before submitting orders to their principals. In Angle Bars a firmer tone also prevails.

The Pottsville Iron and Steel Company, of Pottsville, Pa., have appointed Charles C. Loring, No. 4 Liberty Square, Boston, Mass., their agent, in place of A. G. Tompkins, for the sale of their Beams, Channels, Angles, Tees and Plates in the Eastern States.

Metal Market.

Copper.—In London the speculators have run up during the week spot Chili bars all the way to £95, while futures improved to £79. 5/ and are now £79. Good merchantable brands have advanced to £76. 10/, and Best Selected has risen to £80. As the visible supply in England and

France on the 1st inst. has increased to 84,140 tons, against 75,474 on August 1, a difference of 8,666 tons, this is about as bad a show as can be made, hence the above advance to £95 can only be the result of manipulation foreign to the real position of the metal, and this explains the apathy here in the face of the said rise. Our market has been pretty much stagnant, and is quoted this morning 16.10¢ for spot and September nominally. A dispatch was received here by one of the daily papers from Boston to the effect that the syndicate was taking steps to extend its contracts with mining companies on this side from three years to 12, upon condition of the companies reducing their present output 20 %, so as to prevent accumulation of stock, inevitable in view of the steady falling off in consumption. The Anaconda will be open for a new contract, to date from January 1 next, and this piece of news may have been started as a feeler. Or perhaps it is a mere Boston Copper stock-jobbing "canard" to influence the market for stocks favorably. Rio Tinto shares rose 20 francs in Paris last week.

Tin.—London suddenly rose last week £5. 10/ per ton with spot Tin, and £6. 5/ with futures, the outstanding short interest to be covered being supposed to be so large as to favor this unexpected improvement—unexpected, because there was an impression that the statistics, in consequence of heavy Eastern shipments, would prove anything but encouraging. These statistics are, indeed, not of a stimulating nature, the visible supply on September 1 in Europe and America being 12,740 tons, against 13,966 on August 1, a decrease of only 1226 tons. Last year on September 1 it was 11,573 tons, and 11,690 on September 1, 1886. London came £97. 7/8, spot, yesterday, but is again £98. 2/8 to-day, while futures rose from £97. 17/8 to £98. 12/8. Here, last week some 40 tons were taken at 21.10¢ @ 21.90¢, and this week 20 tons. September at 21.90¢ @ 22¢, 75 tons October selling to-day at 22.15¢, 22.20¢ and 22¢, the latter the last transaction, the market winding up quiet at 22.15¢, spot. As per cable message from Gilfillan, Wood & Co., Singapore, to Mr. Charles Nordhaus, New York, September 1, the August shipments this way were 300 tons, against 750 last year; to England, 1800, against 1300; since January, respectively, 1450, against 3550, and 12,400, against 8800. **Tin Plates.**—The scarcity of Coke Tins continues, and under a good demand the quotation, as shown at foot, is slightly higher. Other descriptions also move off to a fair extent on the spot; futures sell with ease at figures somewhat below spot prices. Liverpool, meanwhile, exhibits great strength. We quote toward the close, large lines, per box, on the spot: Siemens-Martin Steel, charcoal finish, \$4.85 @ \$5.25; Coke finish, \$4.75; Ternese, \$4.30 @ \$4.40; Bessemer Cokes, \$4.60 @ \$4.65, and Wasters \$4.20 @ \$4.25; Liverpool is 13/8 with Coke Tin.

Lead.—During the week some 2000 tons have again been taken by speculators in the open market and on the Exchange, taken together, at up to 4.95¢. Consumers have bought absolutely nothing, and they at their late meeting have not even advanced prices, nor have White-Lead manufacturers, the demand for all these Lead manufactures being too slack to warrant higher prices, and thereby perhaps interfere with the expected fall demand still to come. At St. Louis 500 tons were purchased for New York at 10¢ above the price it can be laid down here with 20¢ freight, the quotation there being 4.65¢. At the close 4.92½¢ has been bid and 5¢ asked, 100 tons November having sold to-day at 4.85¢. The entire speculation seems unreasonable and is looked upon by the trade as very risky. In London Soft Spanish ad-

vanced from £13. 10/ to £13. 12/6; it costs 5.05¢ duty paid to lay it down here, and English Pig is cabled £13. 16/. As for the so-called European Lead syndicate in embryo, the report is that the committee appointed to frame the by-laws for the same has not yet finished its labors, some leading producers still rustivating. A common selling office seems to be discarded from the very start, not being deemed practicable.

Spelter.—At the advances insisted upon Common Domestic does not sell very readily, but is dragging at 4.80¢ @ 5¢, while Silesian cannot be had for less than 5.70¢, having risen to £18 in London. Advances are favorable from Silesia, where a brisk trade is being transacted.

Antimony.—Hallett is cabled £38; here a moderate jobbing demand is noticeable at 9½¢ for Hallett and 13¢ @ 13½¢ for Cookson.

New York Metal Exchange.

The following sales are reported:

THURSDAY, August 30.		
10 tons Tin, spot	21.10¢	
10 tons Tin, spot	21.20¢	
25,000 lb Copper, August	16.90¢	
32 tons Lead, September	4.82½¢	
100 tons Lead, September	4.85¢	
50 tons Lead, October	4.85¢	
32 tons Lead, spot	4.87½¢	
FRIDAY, August 31.		
10 tons Tin, September	22.00¢	
100 tons Lead, September	4.85¢	
80 tons Lead, September	4.87½¢	
10 tons Lead, October	4.90¢	
100 tons Tin, September	21.90¢	
16 tons Lead, spot	4.90¢	
96 tons Lead, spot	4.95¢	
200 tons Lead, September	4.85¢	
100 tons Lead, September	4.87½¢	
16 tons Lead, September	4.95¢	
100 tons Lead, October	4.90¢	
50 tons Lead, spot	4.97½¢	
TUESDAY, September 4.		
112 tons Lead, November	4.90¢	
10 tons Tin, September	21.90¢	
10 tons Tin, September	22.00¢	
532 tons Lead, October	4.95¢	
WEDNESDAY, September 5.		
20 tons Tin, October	22.15¢	
30 tons Tin, October	22.20¢	
25 tons Tin, October	22¢	
100 tons Lead, November	4.85¢	

Coal Market.

The Anthracite trade is active, and the recent advance is said to be firmly held. Production at the mines is still in large volume, the total for the week ending September 1 having been 844,665 tons, as compared with 596,369 tons for the corresponding week in 1887, an increase of nearly 250,000 tons, but the output is not quite equal to that of the middle of August. Since January 1 the aggregate is 23,950,114 tons, or an increase of more than 1,250,000 tons as compared with the same time last year. The output for several weeks past is as follows:

	Tons
Week ended August 4	754,883
Week ended August 11	831,615
Week ended August 18	920,922
Week ended August 25	832,058
Week ended September 1	844,665

On the 1st inst., when the advanced prices took effect, the several companies, as a rule, fell back on their reserved privilege and proceeded to fill unfinished orders at the "rates current at time of delivery." Operators and shipping companies in reference to complaints that the advance was unnecessary, are represented as saying that they "have been taxed to their utmost for more than a month to fill the orders for coal they have received even at the high prices which have recently been ruling, and that the situation warranted increased prices and tolls."

New York prices are as follows:

	Broken.	Egg.	Stove.	Cnut.
Hard white ash	\$4.15	\$4.40	\$4.65	\$4.55
Free white ash	3.95	4.20	4.45	4.55
Lykens Valley	5.00	5.50	5.50	5.25

Pea has sold as low as \$2, this size being in excess. Cargo prices, free on board at

New York, compare with those of a year ago, as follows:

	August, 1887.	August, 1888.	Inc.
Broken	\$3.65	\$3.85	\$0.20
Egg	3.80	4.15	.35
Stove	4.25	4.50	.25
Chestnut	3.85	4.40	.55

The Philadelphia *Ledger* says: "The new prices for Anthracite are being firmly maintained at about the full circular figures, and 'shopping' for Coal to get a shade off the circular prices is a thing of the past. Some Coal shippers are asking, Where is all the Furnace Coal going to? saying it puzzles them to know, as there are so many iron furnaces idle and that some of those in blast are using Coke, and yet there is no visible surplus of Lump and Broken sizes, notwithstanding the enormous output of Coal this year. The production of Lykens Valley Coal, which has been limited for several months, is increasing, and on Thursday Graef, Wilcox & Co. and Graef, Miller & Co. resumed operations in the Lykens Valley region."

Bituminous Coal is in rather better demand, and the tonnage steadily increases. Clearfield production for the week was 65,897 tons, and for the year since January 1, 2,129,000 tons, against 2,011,000 for the same time in 1887; Cumberland do. for the week, 74,728 tons, and since January 1 2,195,000 tons; increase 240,000 tons. The Philadelphia *Record* says: "The short-sightedness of the policy of the Anthracite Coal managers in keeping up the price of that article is shown in the fact that the supply of Bituminous Coal for the seaboard has increased so far this year 1,700,000 tons, while the amount of Anthracite is almost the same as for 1887. The exorbitant price and the difficulty of getting full supplies have led some large manufacturer in this city to give up Anthracite Coal entirely and to use Bituminous in its place. Nearly the whole gain of the Anthracite producing companies is in their Western trade, and on this they levy such heavy tolls that there seems a possibility that they may kill that also. The price in Chicago is now over \$9 per ton, and has led to a lively kick there against the extortion of the Coal companies."

The shipments of Anthracite Coal to the West by lake from Buffalo are the largest on record and aggregate 313,000 tons for the month and 1,406,000 tons for the season.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from August 13 to August 30, inclusive, and from January 1 to August 30, inclusive, were as follows:

		Aug. 13 to Aug. 30.	Jan. 1 to Aug. 30.

Financial.

The business situation and hopeful outlook have not been adversely affected by any of the events of the past week. Crop accounts are no less flattering, and the industries through the entire range are without disturbance, and to all appearances are at least moderately prosperous. The exemption from labor troubles is at least worthy of notice. In the cotton industries there are a number of new mills building, especially in the South, and woolen mills are more active. Glass manufacturers, as is usual at this season, are starting again. Railroad tariffs are not yet altogether on a settled basis. Chairman Cooley, of the Interstate Commerce Commission, on his attention being called to the dispatch from Chicago regarding rates over the Southern Pacific road, said it is not in the power of the traffic manager to make rates between New York and Pacific Coast points as low as he pleases and at the same time put rates between interior towns and the Pacific Coast as high as he pleases. There are considerations of relative equality and justice that cannot be ignored and that have been kept steadily in view in all that the commission has said in its ruling hitherto. They will be kept just as steadily in view hereafter.

The Stock Exchange markets were dull but generally strong. Lackawanna after an advance of about 8% within ten days, was a fraction lower. The grangers were regarded with more confidence since the decision by Judge Fairall in the case of the Rock Island Railroad against the Iowa State Commissioners. His decision is identical with that of Judge Brewer in the cases recently reported, and is, in brief, that the commissioners are not empowered to fix the rates so low as to prevent the carrier from receiving a reward for the services rendered, and that in doing so the commissioners became wrongdoers, "for the reasons that their acts were in violation of the commands of the statute that required them to make just and reasonable rates, and in violation of

the constitutional provisions which restrain the State as well as its officers from making and attempting to enforce by law rates which were not compensatory." On Friday the denial of the report about the probable disruption of the Trunk line pool had a favorable effect, and there was less disposition than expected shown to sell on account of the Retaliation bill proposed in the House. The Saturday half-holiday and the holiday on Monday made trading small. On Tuesday there was a gradual rise in the Oregon, Northern Pacific, Reading and Lackawanna, and the tendency was generally upward to near the close, when there was an irregular decline. It was reported that a through route from the West to Baltimore, Philadelphia and New York via the Baltimore and Ohio Railroad has at last been effected. The Pennsylvania Railroad, it is said, will not offer opposition to the deal just consummated. The Reading Railroad Company has decided to widen all its tunnels and to widen and improve its tracks in order to increase its freight carrying capacity.

United States bonds are quoted as follows:

U. S. 4½s, 1891, registered.....	106½
U. S. 4½s, 1891, coupon.....	107½
U. S. 4s, 1907, registered.....	129½
U. S. 4s, 1907, coupon.....	129½
U. S. currency 6s.....	120

The total bank clearances last week in 38 cities show a decrease of 16.4 per cent. compared with last year, against an increase of 1.4 per cent. the previous week. Clearings outside of New York show a decrease of 1.5 per cent. as compared with last year, against an increase of 9.6 per cent. the previous week. The loss at New York was exceptionally large, and must be mainly ascribed to dullness in speculation.

Higher prices for wheat and breadstuffs, caused by bad weather reports from Europe, have been succeeded by an easier feeling and irregular prices, with a light business. There was great excitement on Tuesday in wheat. Owing to the unfavorable reports from the crops, the price reached \$1.04½ and closed at \$1.04½, as against \$1.01 on Saturday. Compared with a week ago, wheat is ½¢ @ ¾¢ lower. Corn is a shade lower, but about steady. Provisions were raided in Chicago, but in New York were quiet. In the grocery trade sugars were higher, both raw and refined. Coffee is unsettled. Cotton closed steady, and spots were reduced ½¢ to confirm nearer to the September options. Active business was done at 10½¢ @ 10½¢. The new crop was somewhat weaker as a result of favorable crop reports. The rise in the price of jute bagging is said to be delaying deliveries. Ocean freights touched a higher point than before for a long while, but advanced prices for commodities generally have kept exports within narrow limits. Among dry goods jobbers there was a marked improvement, especially noticeable in New York, and alike satisfactory as reported from other seaboard markets.

The weekly bank statement showed the first heavy drain to move the crops, the demand from the South having been delayed by late cotton. The surplus reserve was reduced over \$4,200,000, so that the excess now stands at \$16,766,625, as against \$5,200,000 at the corresponding week last year and nearly \$7,000,000 a year before. Specie showed a decrease of \$4,397,800. In loans the expansion was larger than the previous week, amounting to \$2,983,900. Taken altogether the statement bears out the reports in regard to increased activity in general trade, and the loss in surplus reserve, although large, occasions little surprise at this season of the year.

Commercial paper was in fair supply, but the demand was not urgent. Rates were

for 50 to 90 days' indorsed bills receivable $4\frac{1}{2}$ to 5 %; for first-class four months' commission house names $4\frac{1}{2}$ to $5\frac{1}{2}$ %, and for good single names $5\frac{1}{2}$ to $6\frac{1}{2}$ %. Banks are discounting little except for their own customers. Sterling exchange is dull at $\$4.95\frac{1}{2}$ @ $\$4.88\frac{1}{2}$, the same as for the previous week. The supply of cotton bills is a little better. The Bank of England rate remains at 3 %, against 4 % at this date last year. The gross earnings of 74 railroads for the third week in August show an increase compared with last year, when they were considered remarkably favorable. The *Daily Stockholder* reports interest and dividend payments during the month of September of $\$17,363,328$, against $\$15,077,038$ for the corresponding month last year. In addition to this, however, the Government has paid $\$2,500,000$ for quarterly interest on $4\frac{1}{2}$ % bonds. The exports of specie from this port last week were $\$504,000$; imports nominal.

The imports of merchandise at this port during the week were valued at $\$8,667,365$, of which over $\$3,000,000$ represents dry goods. Since January 1 the aggregate is $\$317,372,000$, as compared with $\$319,107,000$ for the same time last year, and of $\$293,689,800$ in 1886.

The *American Banker* states some interesting facts respecting the increase in the number of banks in different parts of the country during the first half of the current year. The whole number of new banks organized during that time was 522, against 267 during the first half of 1887. The amount of their capital was $\$27,014,150$, or an average of less than $\$52,000$ each, against $\$23,427,200$ during the same time last year, or an average of over $\$87,700$ each. The most of these new banks were organized in the Southern and Western States.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Sept. 5, 1888.

Parties who sold Chili Bar futures "short" some time ago, on which deliveries became due within the past week, have been given a practical lesson in what the "syndicate" is capable of doing in the way of making an artificial stringency. In fact, the "shorts" have been severely squeezed and had to pay as high as $\$93$ @ $\$95$ for cash warrants, whereas futures have ruled at about $\$79.10$ / and $\$8$ M. B. contracts at $\$76.10$ /. Meanwhile consumers have been supplied, on certain conditions, with Chili Bars at $\$78.10$ / for prompt delivery, or $\$15$ @ $\$17$ below the prices which the "shorts" have been obliged to pay on the open market. Surface indications fail to reflect any material increase in the amount of Copper passing into consumption. To the contrary, the actual deliveries are not above a full average amount and surplus supplies continue to rapidly increase on the hands of the syndicate. It is now estimated that the syndicate holds no less than 100,000 tons of various Copper in England and France in addition to the extensive quantity of American product in the American market. It is stated that the officials of some of the mining companies are becoming alarmed at the rapid accumulation of surplus stocks and talk of the propriety of measures being taken to reduce the output. The chairman of the Bratsberg Company, it is stated, remarked at a recent meeting that he believed a crash to be certain unless the mine owners combined to curtail production. There

has been a quite extensive business in furnace material the past fortnight, and, in all instances, at firm prices. James Lewis & Sons' circular notes, among other sales, 1750 tons Anaconda Matte at $15\frac{1}{2}$ ¢, f.o.b. Liverpool, and 34 tons American Precipitate at the same price.

The Block Tin market has fluctuated widely under the influence of active speculation, with both "bulls" and "bears" striving for supremacy. The Dutch interest is believed to favor those traders whose operations are for a rise, and the result of the Batavia sale of Billiton tended to strengthen the impression. The sale realized an equivalent of $\$101$ delivered in Holland, and the first announcement of the result caused considerable excitement, particularly among the smaller traders who stood "short" on the market.

The Tin-Plate market continues very strong. Production is still closely taken up, and in view of this fact, together with the advance on Block Tin and Iron, nearly all makers are holding for still higher prices. There has been a misunderstanding between the proprietors of Margam Works (Port Talbot, Glamorganshire) and their employees, resulting in a temporary stoppage of work at their nine mills.

The demand for Scotch Pig Iron has continued active and prices show a still further hardening. Middlesboro' product has also also undergone a further advance on large transactions, and large sales are reported of Hematites also. It is stated that about 1000 tons Middlesboro' Pig were sold for the American market, the first transaction of the kind in several months. The advance in prices during the week is 6d. to $1\frac{1}{8}$ on Scotch Pig, $1\frac{1}{8}$ on Hematites and 6d. on Middlesboro'. Spiegeleisen is offered somewhat lower. Steel Rails, Blooms, Billets, &c., are held higher, owing to the advance on crude material. Old Iron Rails are also $2\frac{1}{8}$ higher, and steamer freights have advanced $2\frac{1}{2}$ @ $3\frac{1}{2}$.

Scotch Pig.—The market strong at the advance and active.

No. 1 Coltness, f.o.b. Glasgow	50/
No. 1 Summerlee, " "	51/
No. 1 Gartsherrie, " "	47/8
No. 1 Langloan, " "	47/8

No. 1 Glengarnock, " Ardrossan	45/3
No. 1 Dalmeilington, " "	42/8
No. 1 Eglinton, " "	41/8

Steamer freights, Glasgow to New York, $8\frac{1}{2}$ @ $9\frac{1}{2}$; Liverpool to New York, $10\frac{1}{2}$.

Cleveland Pig.—Bessemer has been brisk and prices show a further 6d. advance. No. 1 Middlesboro', G.M.B., $37\frac{1}{2}$; No. 3 do., $34\frac{1}{8}$.

Bessemer Pig.—There has been a large trade and the market is very strong. West Coast brands, mixed numbers, $45\frac{1}{8}$, f.o.b. shipping point.

Spiegeleisen.—The demand very slow and prices rather easier. English $20\frac{1}{2}$ quoted $75\frac{1}{2}$, f.o.b. N. W. England shipping point.

Steel Rails.—Moderately active demand and prices held higher. Standard sections quoted at $\$3.18\frac{1}{9}$, f.o.b. at N. W. England shipping point.

Steel Blooms.—More business doing and the market firmer. We quote $\$3.15$ / for 7×7 , f.o.b. at N. W. England shipping point.

Steel Billets.—A quiet, active trade, and prices somewhat higher. Bessemer, $2\frac{1}{2} \times 2\frac{1}{2}$ inch, $\$4$, f.o.b. at N. W. England shipping point.

Steel Slabs.—Prices are held higher, but there is less doing. Bessemer, $\$3.17\frac{1}{8}$, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—Demand rather slow but prices held firmly. Mild Steel No. 6 quoted at $\$5.18\frac{1}{9}$ and No. 5 at $\$5.25\frac{1}{2}$, f.o.b. at N. W. England shipping point.

Old Rails.—Supplies sparingly offered. Demand is larger. Tees quoted at $\$2.17\frac{1}{8}$, and Double Heads $\$3$, free on board.

Scrap Iron.—There is more demand and prices are firmer. Heavy Wrought quoted at $\$2.5\frac{1}{2}$, f.o.b.

Crop Ends.—More business doing and prices are firmer. Bessemer quoted $\$2.7\frac{1}{6}$ @ $\$2.10\frac{1}{2}$, f.o.b.

Tin Plate.—The market firm with fairly good demand.

Manufactured Iron.—There continues to be an active business and prices are strong. We quote, f.o.b. Liverpool:

	£	s.	d.	£	s.	d.

" Common "			@	5	0 0
" Bl'k Sheet, singles			@	6	15 0
Welsh Bars (f.o.b. Wales)...	4	12	6	@	4	15 0

Tin.—The market irregular, but showing strong undertone. Straits quoted at $\$97.17\frac{1}{8}$ @ $\$98$, spot, and $\$98.10$ / for three months' futures.

Copper.—Prompt Chili Bars strong; futures firm. Trading brisk. Chili Bars, $\$95$ @ $\$95.5\frac{1}{2}$, spot, and $\$79.5\frac{1}{2}$ three months' futures. Best Selected, $\$79$ @ $\$80$.

Lead.—There is a fairly good business. Prices very firm. Soft Spanish, $\$13.10$ / @ $\$13.15\frac{1}{2}$.

Spelter.—Demand has continued good and the market strong. Silesian, ordinary, $\$17.15\frac{1}{2}$ @ $\$18$.

The new passenger station of the Central Railroad of New Jersey, in Jersey City, will be an imposing structure of brick, three stories in height, with a central tower 140 feet above the ground, and the frontage will be 217 feet. The main waiting room will be floored with bluestone flagging, and the sides will be formed of glazed brick imported from Germany. The structure will be made as nearly fire-proof as possible, the partition walls being of fire-proof material, while the floor beams and roof will be of iron. The train shed, 510 feet in length, will be roofed with iron, supported on iron beams and girders. The total cost of this improvement is estimated at $\$300,000$.

Hardware.

A good feeling prevails in the market, and manufacturers and merchants speak hopefully of the outlook for the season's trade. Buyers are placing orders more freely and the aggregate of the business is good. The general steadiness in prices and the improved condition in certain lines, together with the excellent prospects for business at large, are features to be noted as rendering the situation satisfactory.

Barb Wire.

The Eastern market is without special features, the demand being quite limited. Prices are nominally unchanged, the indications being, however, that lower quotations than have prevailed during the past season will rule during the coming season.

Cut Nails.

There is a slightly improved feeling in the New York Cut Nail market, due to a fair run of orders, and due to the greater confidence which buyers show. The setback experienced in the spring in building delayed considerable work, which has again been taken up, and distributors of Nails find that the consumption is a little heavier than expected. They see no danger in buying for the next 30 or 60 days, while there is always the possibility of an advance. Although Steel Nail Slabs have risen materially in the West, they have not as yet gone higher in Eastern and Central Pennsylvania, though large contracts have been placed lately. The rise in Old Rails has but little influence on the Nail trade, because they are used to a far less extent than they were formerly. Prices of Nails in the New York market remain the same, \$1.85 @ \$1.90 for carload lots on dock, and \$1.90 @ \$1.95 for small lots from store.

At the meeting of the Western manufacturers, held at Pittsburgh last week, 19 out of 34 mills were represented. A resolution was unanimously passed in favor of joining a pool, provided the assent of the absent manufacturers could be obtained. The position in the West differs from that in the East in that there has been a marked advance there in Steel Nail Slabs.

The Western manufacturers of Cut Nails express themselves very confidently in regard to sustaining the advance in price which they have recently made. It is further intimated that as soon as the advance is realized by the trade to rest on a firm basis, another step upward will be taken. Usually heavy contracts have been entered at very low prices before an advance is made by the manufacturers, but they assert that this fall they have not committed that mistake. The benefit accruing from higher prices will thus be reaped by themselves and not by the merchants. It remains to be seen whether the manufacturers really have thoroughly learned this lesson. If they have done so, they will have accomplished a great deal toward again making the manufacture of Cut Nails a reasonably profitable branch of the Iron and Steel trades. They will still have the competition of the Wire Nail to contend with, but there is a wide field for both to work in.

Wire Nails.

The improved condition of Wire Nails, especially in the West, is to be noted, and the maintenance by the manufacturers of the recently advanced quotations, \$2.55 for carload lots, and \$2.65 for smaller lots. The Eastern market feels the effect of this improvement, but no announcement of a corresponding change has been made.

Miscellaneous Prices.

Lee-Clarke-Andreesen Hardware Company, successors to Lee, Fried & Co.,

Omaha, Neb., have issued their Gun catalogue No. 1, which is an elegantly printed large-paged pamphlet of 32 pages. It is accompanied by the discount sheet given below, which, besides giving prices on the goods, will be of interest as showing definitely the lines of Fire Arms and Implements offered by the company:

	Per cent.
Breech-Loading Double Guns.....	33½
Pieper's Breech-Loading Double Guns.....	40&10
Colt's Breech-Loading Hammer Guns.....	25&10
Colt's Breech-Loading Hammerless Gun.....	25
Winchester Repeating Shot Gun.....	25&10
Hopkins & Allen Single Shot Gun.....	33½
Flobert Rifles, XL Breech-Loading Gun, &c.....	33½
Winchester Rifles.....	25&10
Colt's Rifles.....	25
Marlin Rifles.....	25&10
Colt's Revolvers.....	25
Revolvers.....	25
Revolvers.....	50
Gun Implements.....	50&10
Gun Implements (except Ideal Tools).....	50&10
Ideal Tools.....	25
Reloading Tools.....	25
Cartridges.....	25
Brass and Paper Shells, and Loaded Shells.....	Prices quoted upon application
Shot, Powder, Dunscomb's Shot Case, \$4.25 net.....	
Primers and Percussion Caps.....	
Gun Material (except Wad Cutters).....	50
Wad Cutters.....	30
Powder Flasks and Shot Pouches.....	33½
Cork Screws.....	30
Pocket Cork Screws and Key Rings.....	30
Dog Collars.....	33½

Attention is also called to the lines of goods for which the company are manufacturers' agents, and the last page of the catalogue is devoted to their Cutlery department.

The Burnside Mfg. Company, Burnside, Ky., for whom Wm. H. Jacobus, 90 Chambers street, New York, is agent, issue a circular representing a new cedar Faucet which they are now manufacturing. They call attention to the improvement in the finish, it being explained that every trace of the saw and lathe marks is removed, while an improved polishing machine gives a hard, smooth surface, which makes the Faucets attractive in appearance. An oblong hole is made in the side of the key, which is referred to as affording a freer flow and rendering the key absolutely interchangeable. This is an advantage which will be appreciated when Faucets are to be packed with other goods, as the keys can be taken out, thereby reducing materially the space occupied. The circular also alludes to other advantages possessed by the company's Faucets, mentioning the desirability of red cedar for Faucet use, the fact that there is no lining of cork or leather to become loose and that there is no metal to corrode. The Faucets are sold from the following price list, which is subject to a discount of 50 per cent.:

6	7	8	9	10 inch.
\$10.80	11.52	12.24	15.12	18.72 per gross.

The Faucets are packed in barrels which contain about the following number of Faucets: 6 inches, 35 dozen; 7 inches, 30 dozen; 8 inches, 24 dozen; 9 inches, 20 dozen; 10 inches, 15 dozen.

It is intimated that the American Needle and Fish Hook Company, New Haven, Conn., for whom the Alford & Berkele Company, 77 Chambers street, New York, are agents, are about to enter upon a new departure looking to a more general marketing of their goods, instead of permitting the European manufacturers to sell their goods in this country to the extent to which this has been heretofore done. Thomas Wallace, of the well-known firm of Wallace & Sons, Brass manufacturers, has been elected to the presidency of the company and Mr. Hull has been chosen superintendent. In the revised price list the Ringed and Flatted Kirby and Limerick Hooks are put upon the same list. The discount on these Hooks is 50 and 10 per cent.; on the New York Trout or

Carlisle Hooks the discount is 60 per cent. and on the remainder of the list 50 per cent.

The Claffen Mfg. Company, Cleveland, Ohio, quote their Security Sash Locks and Security Door and Window Bolts at discount 70 per cent.

An advance in the prices of Shot took place August 30. The following are the present prices, subject to a discount of 2 cents per bag, 25 pounds, if paid within 5 days from receipt of bill:

Drop Shot, per 25-pound bag.....	\$1.40
Drop Shot, per 5-pound bag.....	.38
Buck and Chilled, per 25-pound bag.....	1.65
Buck and Chilled, per 5-pound bag.....	.38

An advance has also been made in the price of Sheet Lead, Lead Pipe, &c., the present prices of which are as follows:

Lead Pipe, per pound.....	\$0.07¼
Sheet Lead, per pound.....	.08
Block Tin Pipe, per pound.....	.45

It is gratifying to note the satisfactory condition of the Auger and Bit market. Prices are maintained with steadiness and regularity and this line of goods is thus in a condition more satisfactory than it has been for some time. A conservative policy, which may perhaps be regarded as the natural reaction from the animated competition which has frequently prevailed in this line, is the cause of the improved condition rather than any artificial or formal strengthening of the market in the way of combination between the manufacturers.

Stove Hollow-ware continues without material change, this line being characterized by steadiness in price and a maintenance of the advances which have from time to time occurred. In the present condition of things it is anticipated that there will be before long a further moderate advance. Enamelled and Tinned Hollow-Ware remain without change.

The prices of Agricultural Wrenches are well maintained by the manufacturers and the condition of the market in this line is regarded as satisfactory. Only a slight irregularity is caused by the stocks held by many of the jobbing houses and purchased by them at the considerably lower prices which recently prevailed. The influence of these goods is not sufficient to seriously interfere with the maintenance of prices by the manufacturers, and it is expected that the supply now offered at irregular figures will soon be exhausted.

The disturbances in the Agate and Graniteware trade at Chicago and St. Louis have at length been happily ended and the manufacturers and jobbers are again pursuing the even tenor of their way. The unsettled condition of this trade can be traced back to about a year since. At that time a prominent Western jobber began to give an extra discount to his customers, notwithstanding an agreement made between the manufacturers and all jobbers that these goods should be sold at a price not below a fixed rate. Probably the house referred to was not the only erring member of the family, but as the practice became known to other jobbers they appealed to the manufacturers to be released from their agreement, so that they might establish any price found necessary to meet competition. About the 1st of June the manufacturers acceded to their request and gave the jobbers the liberty they asked for. A very short time sufficed to show the undesirability of such an arrangement, and the manufacturers then attempted to rebuild the fabric which had been destroyed. Opportunity was thus given to jobbers desiring a change in the former agreement to insist upon the adoption of their views as a condition of their signing. A stand was also taken against recognizing as jobbers in these goods those who had been prominent in cutting prices, in violation of the agreement. For a time a rupt-

ure in the friendly relations of prominent jobbing houses seemed impending as an outgrowth of the attempt to settle this one question. Conditional agreements were at length signed by some of the jobbers who were most conciliatory in their temperament and earnestly desired to re-establish peace, and, with these signatures for a beginning, the manufacturers continued their efforts with ardor until all had signed. The *statu quo ante bellum* has now been regained, manufacturers and jobbers occupying their former relations and prices being restored to their old figure.

Obituary.

Amos Call, president of the Bemis & Call Hardware and Tool Company, Springfield, Mass., died at his home in that city on Thursday last. He was stricken with paralysis on Sunday and was unconscious the greater part of the time until his death. Mr. Call was a native of the city in which he died, having been born in 1814. In 1828 he was apprenticed to Stephen C. Bemis to learn machinists' trade, Mr. Bemis being engaged in Willimansett at that time, where, as well as at Hartford and Meriden, Conn., Mr. Call's early life was spent. In 1844 he returned to Springfield, and, in connection with Mr. Bemis, the business was established with which he was connected at the time of his death. The manufacture of tools which was begun at Willimansett thus became an important industry, and Mr. Call was active in its development. The first manufacturing was done in what is now Alden's Building, on Mill River, but in 1864 the company moved to the American Machine Works, on Liberty street. Five years later they returned to Mill River, having bought the property in which they have been located ever since. During the war the company did a large business in the manufacture of harness irons. They suffered from a disastrous fire in 1872, but the business has been prosperous since. Mr. Call took an active interest in the affairs of the city, in which he has held different offices. He was a prominent member of the First Baptist Church and was also a leading Mason. He celebrated his golden wedding May 16 of the present year. His personal qualities are thus referred to in an article relating to his death in the *Springfield Union*:

One of Mr. Call's leading characteristics was his thoroughness, and whatever he undertook received close and conscientious attention. He was devoted to his business, but did not neglect any of the other relations and duties of life. No sacrifice was considered by him too great to make for his family and friends, and his home life was delightful. He was a kind and considerate neighbor, and those who knew him most intimately feel that they have lost a friend on whom every dependence could be placed. He was held in high regard by rich and poor alike, and in his death the community loses one of its best citizens.

Trade.

Our reports from Louisville, Ky., under date September 3, are to the following effect:

The Hardware trade of Louisville, Ky., is feeling the general impulse of advance that comes over the country, and which is appreciated by a commercial center possessing great advantages and being awake to its possibilities. True, the Cut Nail and Wire Nail manufacturers stole a march on the trade here, having met and advanced prices before the dealers, with few exceptions, were aware of it. This action, though much desired and expected, was unlooked for so suddenly, but enough Nails were secured for legitimate pur-

poses. Probably 15,000 kegs of Cut Nails were placed here, which amount is not too large for this market. Wire Nails came in for a good share of patronage and have secured a very desirable custom. The Nail mills say their action in advancing 15 cents per keg was forced by Steel going up \$2 per ton, all of which is legitimate and ought to hold.

Bar Iron has also advanced \$1 per ton and will probably soon take another step forward, caused by the upward movement of Old Rails. The demand from store for Bar Iron has improved and cut prices are withdrawn by the dealers.

Carriage and Wagon Goods continue in active demand and those dealers making a specialty of heavy goods report a very satisfactory trade for the past month.

Wire of all kinds remains too low, in comparison to other goods, but shipments from store are large in volume, although at small profits to the dealers.

The city is entering on a month of commercial celebration and is putting on holiday attire. On certain days during the next four weeks the city will be given up to magnificent pageants, which is a new venture for Louisville, but as all the merchants and manufacturers have gone into the spirit of the enterprise, it is bound to be a success.

All of the business streets are profusely decorated and illuminated at night, and grand results are anticipated from the varied attractions offered visitors.

The following review of the Hardware trade of New Orleans, for the year ending September 1, is given by the *Times-Democrat* of that city:

The volume of business for the year ending June 30, 1888, was quite satisfactory to the New Orleans jobbers. In our report of September 1, 1887, we called attention to the fact that the volume of business for the year ending June 30, 1887, was 25 per cent. greater than the previous year. It is an encouraging feature in this branch of business to see that this increase continues. A careful estimate, based chiefly on actual figures, shows the increase in the amount of goods handled by the trade for the year ending June 30, 1888, to be over 30 per cent. greater than that of 1887. It should be borne in mind that this large increase was made in the face of a brisk competition from the North and West, where a partial failure of the crops paralyzed business and caused those sections to look to a more distant and favored field in the South to unload their surplus stocks, bought in anticipation of their usual home demand. That our Hardware merchants were able not only to hold their own, but to increase their trade under such circumstances is an evidence of their ability to compete with any market. The small profit resulting from a surplus of goods on the market was felt, but the increase of sales compensated for this loss. During the year there has been a gradual decline in values, notably in Iron, Nails, Iron Pipe, Barbed Wire and several articles of Hardware not sustained by combinations and in which the cost of production is not chiefly due to labor. The outlook for the future is encouraging; crops throughout all sections of the South, with few exceptions, are good and a fine harvest may be expected.

The *San Francisco Journal of Commerce*, in a recent issue, gives the following review of the trade in Hardware and Metals for the past half year:

There were no very great changes as to prices in Hardware and Agricultural Implements during the half year. There was, however, a very good business done, and a considerable increase shown over that of last year on account of the vast increasing population of the State and the many new homes being built in every quarter. The quantity of Scrap Iron imported has been almost 7000 tons in excess of that for the same time in 1887. All this goes to the rolling mills for the production of Bar Iron, &c., showing a very great increase in home production. In the spring heavy sales of Pig Iron were made for the South. In the Nail trade imports have been light, while home production has been very large. The market opened in January with \$2.75 as the basis price for carload lots, and \$2.90 for less quantities. On March 1 carload lots were advanced to \$2.90 and smaller quantities to \$3. In April carload lots were advanced to \$3, smaller quantities to \$3.10. This was the highest, as on June 5 there was a reduction to \$2.90 for carload lots and \$3 for smaller quantities. There was considerable fluctuation in the price of Pig Tin. It opened at 35 cents to 37½ cents in January. In February the market advanced to 40 cents, but dropped to 38 cents at the close. In March it dropped to 36 cents. It remained at 36 cents to 37 cents through March and April. In May a panic took place in the market, and prices dropped to 30 cents and 33 cents, and then to 22½ cents and 25 cents, at which it

remained in June. The imports of Tin Plate have been the largest in the history of the market. The latter has fluctuated considerably. It opened at \$5 for Coke. In February an advance to \$6 was made. In May there was a drop in price to \$5.50 for Coke. In June there was a further drop to \$5.25.

Robert H. Seymour, treasurer of the Henry Seymour Cutlery Company, Holyoke, Mass., in a recent interview refers to the fact that they export their Scissors and Shears largely to England, Australia, South America and Mexico. They are able to do this, competing successfully with the English manufacturers in their own market because of the special processes employed by them which the English manufacturers have not yet been able to imitate. They also supply the Canadian trade to a considerable extent, although there is a duty of 30 per cent. upon their goods imported into that country.

Items.

Morley Bros., East Saginaw, Mich., advise us that in printing the price lists to which we referred in a former issue they unwittingly used matter which had been copyrighted by T. W. Root, and as soon as this fact was called to their attention they discontinued the distribution of the lists. They allude to Mr. Root's price lists as the best thing of the kind they have seen, and take pleasure in referring the trade to Mr. Root.

A Hardware house, who may be addressed as "Hardware," Box 1385, Post Office, New York, advertise among the Special Notices, on page 56, for an experienced Hardware salesman well acquainted with the Western and Middle New York State Hardware retailers. The opening is deserving the attention of those desiring such a position.

The American Bit Brace Company, Buffalo, N. Y., for whom Sise, Gibson & Co., 100 Chambers street, New York, are agents, in their announcement on page 58 allude to the accumulation of orders, especially for their Pederson Ratchet Brace, causing their patrons inconvenience by delay in receiving the goods. They have, however, purchased new machines, thus increasing their capacity and putting them in position to take care of orders more promptly.

As appears by the announcement on page 55, there will be, September 14, an auction sale of the machinery of E. Remington & Sons, Ilion, N. Y. Some farming implements and other articles are also advertised.

The Biddle Hardware Company, Philadelphia, Pa., have issued a circular for the fall trade, in which seasonable goods especially are illustrated. The exhibit of Lamps, with which the pamphlet opens, is especially fine and satisfactory. It is to be observed that the catalogue gives the prices of the Lamps complete with the shades and the various fixtures, a feature which will be appreciated by the trade. The other goods represented in it are also of interest. A discount sheet will be mailed to merchants applying for it.

Announcement is made that the copartnership heretofore existing between Chas. L. Knapp, William H. Knapp and Clinton I. Hague, who have been doing business in this city under the firm name of Knapp & Hague, and in New Haven, Conn., under the firm name of Union Form Company, has been dissolved. Chas. L. Knapp and William H. Knapp also announce that they have purchased the interest of Clinton I. Hague and will continue the business at 52 Fulton street, New York, and New Haven, Conn., under the name of Knapp Brothers.

The W. F. & John Barnes Company, Rockford, Ill., have issued a new catalogue of their Foot, Hand and Steam

Power Machinery in the form of a well printed and fully illustrated pamphlet of 64 pages, a considerable enlargement on their former issues. The well-known line of machines described in it, with others which have recently been added, will be regarded by the trade with interest.

The Moore & Barnes Mfg. Company, 103 Chambers street, New York, issue circulars relating to some of their recent additions to their line. One of these calls attention to an assortment of spooled wire, which is put up in a painted wooden box with a hinged cover. This assortment contains 140 spools of Black and Tinned Annealed Steel, Copper and Brass Wire, and comprises sizes likely to be called for. The assortment is described in the circular with the retail prices, showing that the dealer can realize \$10 on the assortment, the price at which it is sold giving a good margin of profit. Another circular relates to the Phoenix Bench Anvils for amateurs, jewelers and light bench use. Three sizes are made, weighing respectively 1½, 3½ and 7½ pounds. The Phoenix Window Cleaners and Floor Scrubbers are also alluded to, illustrations being given of them. A third circular relates to the Phoenix Vegetable and Potato Slicers, Dunlap Pattern, and the Phoenix Carpet Stretcher. The advantageous terms on which these goods are offered are referred to by the company.

Paine, Diehl & Co., Philadelphia, issue a 14-page folded leaflet, which is designated "A Few Decidedly Good Things." In it their leading household specialties are illustrated.

The Bridgeport Chain Company, Bridgeport, Conn., call attention to a new Chain for hanging pictures, which they designate as the Triumph Wire Chain. It is referred to as very strong and the point is made that pictures hung with this Chain are not so liable to shift their position as when hung with Cord, Wire, &c. It is sold upon Spools holding 15 yards, the Chain being of different sizes and offered in finish of different kinds.

S. A. Haines, 90 Chambers street, New York, selling agent for the Little Cyclone Churn, is sending out circulars in regard to it and the favor with which it is regarded by the trade. It is intimated that while it has been on the market for nearly two years no special effort has been made to sell it, but that now its sale is to be pushed, and with a view to getting it into the market as rapidly as possible an important reduction has been made in its price. Circulars relating to it are furnished those who desire to take hold of it.

The Peters Cartridge Company, Cincinnati, Ohio, are attracting attention elsewhere in this issue to an improvement in their Loaded Cartridges. In place of one Wad to perform the duty of retaining the charge after loading two are inserted, thereby assisting to confine the gases caused by the combustion of the powder and developing the full force of the charge. These Wads are lubricated by the company's special formula, and it is claimed that the Gun is thereby kept cleaner than by the use of their previous Wad.

The following announcement of a change in the firm of Dunlavy & Roe, Abilene, Kan., which is made in a local journal, indicates the esteem in which the members of the firm and those connected with it are regarded in their community:

The well-known and extensive Hardware firm of Dunlavy & Roe yesterday dissolved partnership, Mr. Roe retiring from the business and Mr. Dunlavy continuing under the name of John Dunlavy & Co. During the time he has been engaged in business in Abilene, Mr. Roe has made many friends, who will be sorry to hear of his retiring from the business, but who will unite in wishing him success in any new venture he may determine to make. The head of the firm as it now remains is John Dunlavy, a man of eminent business qualifications, who

has been successful in every business undertaking. Mr. Dunlavy has associated with him as general manager and salesman one who is well and favorably known to every citizen of Dickinson County, the veteran Hardware merchant, W. H. H. Bonebrake. Mr. Bonebrake came to Abilene in 1871, and has ever since been identified with the business interests of our city. He will do his part of the work with his old-time geniality, and win many customers to the establishment. Carl Potter, the man of small stature but giant mind, it goes without saying, will be retained to manage the books of the firm. Because of the thorough business qualifications and genial dispositions of the men who constitute the firm of John Dunlavy & Co., we predict for it a future of unexampled prosperity.

Frasse & Co., 92 Park Row, New York, issue a circular calling attention to the U. S. Hack Saw Blades, to the quality and merits of which they allude. The advantages claimed for the Blades are explained.

The Chicago Spring Butt Company, Lake and Union streets, Chicago, have recently made a successful attempt to open up an export trade in their specialties. On the 9th of June they sent a representative to the leading cities of Great Britain and Ireland, who returned to Chicago on the 10th of August with a record of sales made covering 25 tons of Spring Hinges. The points in which he sold goods comprise Cork, Dublin, Belfast, Glasgow, Edinburgh, Liverpool, Leeds and Sheffield. He further made arrangements with Moser & Sons, of London, and Hammacher & Delnies, of Hamburg, to act as distributing and sales agents for the company. They will carry a full line of the company's Spring Butts, which they buy, and will thus sell from stock.

The Competition in Ciphers.

The offer made in our issue August 23, of a prize for the largest list of ciphers for marking goods, on the terms and conditions named, has been received by the trade with much interest. It is evident that the competition will be animated and attended with some interesting developments. Among the replies to the problem given in that issue as to the druggist's cipher, we have the following which describes the manner in which our correspondent approached it:

I started very grandly, thinking it would be a simple matter to solve the enigma algebraically. Although the operation was not very successful, it may be of interest to outline it, in the hope that it will suggest to some others a rule that may be applicable to all such cases. As an illustration take the first item (nail brushes), and we have $12e$ equal rpl ; but of course the letters rpl do not mean that their numerical equivalents multiplied together are equal to $12e$. Expressed algebraically the equation would be as follows: $12e = 100r + 10p + l$. As the letters represent units, tens, and hundreds, in the same way the second equation would be: $12a = 10b + o$. It is needless to go through the full list, as I think this will explain the method I intended to follow. If the druggist had given four more items it would have been easy work to reach the answer, for in that case we would have had 10 equations of 10 unknown quantities, and it would have been only a matter of a little patience to solve for each letter. In the case presented there are 10 unknown quantities, but only 6 equations, and while it might be possible to solve even under these conditions by making use of the substitution and comparison methods, I for my part did not have energy enough to pursue the inquiry far enough to determine. The solution I finally reached was more the result of guesswork than anything else. As each single letter must necessarily be less than 10, 9 will be the only one which when multiplied by 12 will give a product of three

places. It is evident, therefore, that e represents the figure 9 and $rpl = 108$. Another help will be gained from the birdseed and the soap items. In the former case $12f = 10j + a$, or $f = \frac{1}{12}a$, and similarly in the case of soap $i = \frac{1}{12}l$. Both f and i , therefore, must be some number under 5, because, as those equations show, they are half of single units. One or naught they cannot be, because those were already used; therefore they must be either 2, 3 or 4. With this much data, the solution of the remainder was comparatively easy. It is obvious that the word is profitable.

Having relieved my mind of this problem, it occurs to me that possibly you might wish to print one which I have gotten up, and which I believe will not be so easily soluble. Realizing that if 12 times a single number gives a product of three places, the number must be 9, I have carefully refrained from giving any such assistance in the problem below. This problem we will suppose was a'so the work of a druggist, and it so happened that he took the same items, but, being a rather eccentric genius, he priced his goods by the one-half dozen instead of the dozen. I cannot vouch, furthermore, for the approximate correctness of his figures, for, having the answer at hand, it appears to me that his prices are hardly in accord with current market quotations. However, any more preface is unnecessary, so here is the statement in tabular form:

	Each.	Per half dozen.
Nail brushes.....	r	lt
Tooth brushes.....	w	am
Bird seed, packages.....	a	ek
Soap, cakes.....	s	wl
Cologne, bottles.....	ol	akl
Manicure cases.....	tae	eako

Trade Topics.

A Kansas Hardwareman, writing in regard to the case and cartage question says:

On this question of case and cartage there is no question but that the retail trade would be glad to have these charges abolished. While they would still indirectly pay about the same as they do at present they would know more accurately what their goods cost them. It is notorious that manufacturers in some lines charge twice as much for cases and drayage as is variable as case charges. To most dealers outside of the larger jobbing points the case is net loss. These charges for case and cartage are something we never grumble over, but if some houses that we deal with charge us two prices on them we squeeze out a little lower figure from them than from others or let them go. We know of a party who was charged 75 cents or \$1 for a couple of soap boxes ten years ago, and he has never bought a cent's worth of the house since, they refusing to make any rebate when their attention was called to the matter. While we would be very glad to see these charges done away with, we are not very sanguine of this result, as we believe it is a source of revenue for many manufacturers and all jobbers, and we do not think that complaints from their customers are frequent enough to make them consider a change desirable.

From a Michigan Hardwareman we have the following relating to the same question. On his letter-head the following form of order is printed:

Gents: Please ship via R. R. (F. O. B.) Send R. R. contract and draw at sight, 30 days from date of bill, through Home National Bank, without exchange or protest. Cancel all orders for goods not sent with first shipment.

Concerning which our correspondent adds:

I have used the above order for the last 23 years and have no trouble with boxes, cartage, &c. If Iowa Hardware firm adopt the same form they will have but little to charge back.

Concerning the recent course of the market in Wire Nails a correspondent writes as follows:

In conversation with the different manufacturers I hear how certain firms are ruining trade by cutting prices so low that no one can do business, except at a loss, and that many are thus doing business is not to be doubted, but any one who has given the matter any thought can readily see that the present depression is solely the result of natural consequences. We are selling Wire Nails in direct competition

It contains 24 drawers, 9 x 14 inches, running through and divided in the center. They can be drawn out from either side. The front half of drawers is filled with Curry Combs and Brushes, Seine Twine, Trout Lines and Sash Cord, and the rear with surplus stock of Pocket Cutlery, Shears, Stove Blacking, &c. On the

bins holding about 100 pounds each. On this counter is a Westphal Bolt Case. The Stove platform shown in the diagram, Fig. 262, is 24 feet long, 3½ feet wide and 6 inches high and is occupied by Ranges. The Cook and Heating Stoves occupy the remainder of the floor space, as indicated. The office is 7 x 12 feet and is located

Fig. 262.—Store of E. R. Strong, Fort Atkinson, Wis.

with Cut Nails, and on their comparative values must depend the price. As long as the statements so extensively made by Wire Nail manufacturers that Wire Nails contained 50 per cent. more to the pound, and held more than Cut Nails, were not doubted, they readily commanded a corresponding advance in price. But now that Cut Nail manufacturers have proved and extensively advertised the fact that as regards holding qualities the very reverse is true, and that Wire Nails count out less Nails to the pound than advertised, it is certainly very natural that the price should be affected. We believe that Wire Nails can be so improved as to hold more than Cut Nails, but, unless this is done, and done universally, there is more chance of a further decline than an advance in price, which all are anxiously awaiting.

The following inquiry from a Pennsylvania Hardware house explains itself:

What is the reason some of the surplus capital of America is not invested in a solid wrought-steel face or solid steel Anvil factory? You certainly know that there is not a first-class Anvil of European manufacture on the market. The Wright and the Wilkinson Anvils all cushion on the face, crumble on the edges, or the steel plating parts from the body of the Anvil. It is foolish for American manufacturers to persist in ignoring these facts. We want a first-class article made at home, and made at once, and no article of like importance offers such certain and large profit for the same investment. The writer has had 15 years' experience in selling Anvils to the blacksmiths of Western Pennsylvania and Eastern Ohio, and makes no wild statement in saying that he could sell a properly made domestic article to every blacksmith in the United States needing such a tool as against anything imported from Europe. Give this some attention, as our neglect in this matter is unbecoming an inventive, progressive and wealthy people.

Arrangement of Stores.

We give below a diagram of the store of E. R. Strong, Fort Atkinson, Wis., and also a description of some of the special features of his arrangement. It will be observed that the tin shop is in the rear of the store, and that some attention is paid to its fittings. Regarding his store, Fig. 262, which was erected in 1887, and is exceptionally complete in its arrangement, Mr. Strong writes:

My store has a frontage of 35 feet, with an 8-foot entrance. The depth of the building is 85 feet, 25 feet being cut off the rear end for shop. My first counter is 2 feet 4 inches in height and 15 feet long.

south wall or Hardware side the shelving is 18 inches in depth and 8 feet high, surmounted by a small cornice. Above this are two shelves 1 foot in width, on which are kept full packages and surplus stock of shelf goods. Goods on the upper shelving are reached by means of a railroad ladder running the full length of the shelving, 53 feet. The first 12 feet are divided into

Fig. 263.—File and Bit Case.

two cases with sliding glass doors, the first for the display of Guns and the second for Carpenters' Tools. Next to the Tool case is a File and Bit case, 28 x 30 inches, with swing doors, in which are kept Files and Bits in original packages, samples being displayed on the doors, as shown in Fig. 263. Beyond this there are five sections of drawers, each 10 x 6 inches, and three sections, each drawer 8 x 6 inches, and a single row running the full length of the shelving, 15 x 7 inches. Each drawer occupies a pigeon-hole by itself, and has a flanged face to prevent its being pushed in too far. Across the shop wall and elevator side are arranged shelves for Glass and fine Carriage Paints and Varnish.

On the first counter is a high showcase for Pocket and Table Cutlery and Shears and a small counter desk, in which is kept the money drawer and cash sales book. Next comes a double Nail counter, Fig. 264, with showcase for display of Paint Brushes and miscellaneous articles. On the rear end of the Nail counter is a Westphal Screw Case. The third counter is used for Horseshoes and is divided into

12 feet forward of shop, commanding a view of the shop, as well as of the salesroom. The office is not raised from the floor, but is ceiled up to the height of 3 feet 9 inches, and above this is a wire railing 2 inches wide running around the office. The door is of wire and reaches from the floor to the top of the railing. Against the stairway wall I have 19 of J. N. Hager's Patent Fork and Shovel Brackets, of which you have already given a description. This device for keeping Steel Goods I consider one of the most valuable features of my store. The goods are always well displayed and are never in the way.

My elevator is a No. 5 Reedy Double-Drum Elevator; platform 5 x 6 feet. The guide posts and weight are on the side, and the hoisting rope in front and brake ropes in one corner, thereby giving access to the elevator either from the shop or salesroom. The elevator runs from the cellar to the second story.

Our Rope Reels are in the second story. The ends of the Rope are passed through holes in a board nailed to the side of the elevator to prevent them from unreeling too fast, and the ends are brought down within easy reach from the elevator platform on the level of main floor. The

Fig. 264.—Nail Counter.

second story is used principally for storing surplus stock of Stoves, Tinware, Sheet Iron and heavy Tin Plate. In the cellar are kept nails, Barb Wire, Door Hangers, &c.

The shop is entered between the elevator and the stairway door. To the right of the door two 1½-inch gas-pipes lead down from two two-barrel tanks in the second story containing raw and boiled Oil. In the corner of the shop is a self-acting water-closet. Fig. 265 represents

cupboard for keeping Boiler and Tin Plates and Tinners' Trimmings. In the lower right-hand compartment are kept IC and IX 20 x 28 bright Tin Plate and IC and IX 20 x 28 R. T., and the smaller sizes of Tin Plate. In the double cupboard to the left Nos. 8 and 9 Tin and Copper Boiler Plates are kept, each kind having a shelf of its own. Above the Boiler Plates are kept Copper Pits of all kinds. The upper cupboard is mainly occupied by Tinners' Trimmings. By this arrangement the stock is kept in good

Fig. 265.—Cupboard for Tin Plates, &c.

shape. Fig. 266 shows our octagon tool bench in the center of the shop, which fully explains itself. It is 7 feet across, 33 inches high, and has shelf underneath for smaller tools. The eight sides of the bench are occupied by Tin Folder, Vise and Bench Drill, Small Groover, Roller, Double-Seamer, Stove-Pipe Swedge, Stove-Pipe Folder and Groover.

From B. H. Newell & Co., Shelburne Falls, Mass., we have a description of their Belting rack, which is shown in the accompanying illustration, Fig. 267, in connection with accommodations for other goods, as referred to below. After stating that their object in constructing this rack for Belting was to obviate the necessity of removing the roll from its compartment and requiring one clerk to hold it while another unrolled the requisite quantity of Belting, our correspondents in describing their method say:

Our rack is made of standards 3 feet square and 1 inch thick with a semi-circular piece cut from their front side extending to the center. These standards are set upon a base 3 inches high to keep

Fig. 266.—Octagon Bench.

out dust, &c., and are placed $\frac{1}{4}$ inch further apart than the width of Belt the compartment thus formed is intended to hold. To prevent warping and to assist in nailing the standards in place we had a piece of $\frac{1}{4}$ -inch board placed in the bottom and top of each compartment between the standards. In the center of the standards we attached by three screws a hook made from 1 x $\frac{3}{4}$ inch iron, bent as shown in the illustration, the hook being designed to hold a $\frac{1}{4}$ -inch bar. These hooks must be set into the face of the standard just far enough to bring the bar to the center of the compartment. We then took a piece of timber 3 $\frac{1}{4}$ inches square and cut off blocks $\frac{1}{4}$ inch shorter than the sev-

eral compartments were wide, bored a $\frac{1}{4}$ -inch hole lengthwise through the center and drove a piece of $\frac{1}{4}$ -inch machinery steel cut to the proper length (which is 1 inch longer than the blocks), allowing the steel to project through them $\frac{1}{4}$ inch from each end. The edges of the block must be beveled a trifle to prevent injury to the inner turn of the roll of belting. The blocks are then driven into the orifice in the center of the roll and the belt hung upon the hooks above described. The roll is now hung upon its center like a grindstone, can be easily drawn out and as easily rolled up again, without taking it from its place. Our store is 65 feet in length, and the rack, being placed in the rear, gives ample space for unrolling and measuring the belt. Marks along our counter enable us to draw out about the required length; but for measuring we have found no better way than to use a reliable tape.

By this arrangement each roll is independent of the other, can be removed or replaced in its compartment very easily by using a bar, requires only one clerk to unroll and reroll the belt and shows up the goods to the best advantage. We find the top of the rack to be an excellent place for keeping heavy goods, such as Stone Hammers, Babbitt Metal, Bolt Ends, &c., and

Fig. 267.—B. H. Newell & Co.'s Belt and Wire Rack.

we have utilized the space above by building a rack for retail stock of Iron, Steel, Brass and Copper Wire in coils, as shown in the cut. This rack is designed to accommodate our entire retail stock of Wire, bringing together in one place easy of access and displaying the goods very satisfactorily. Too often we find Wire stowed in out of the way corners, hung on pegs to serve as roosts for flies during the summer months, while the sizes are often mixed, taxing the patience of both the merchant and his customer when the article is called for. The top of the rack is used for extra stock of Tire Bolts, Screws, &c. At the left of the space assigned to Belting we have made tills or boxes, which, being 3 feet deep, will accommodate the longest Axe or Pick Handles.

Referring to general features in the arrangement of their store the same house give us the following information, alluding, it will be observed, to the question which has so frequently recurred, as to whether goods should be kept in the original packages or in wooden boxes:

Our shelving is supported by iron brackets instead of wooden standards. This is more satisfactory to us, for we can use all necessary space in displaying a line of goods without encroaching upon a space which the line will only partly fill. It also economizes room.

We keep our shelf goods in original packages as far as possible, and this at present means nearly our whole line, for

goods are now largely put up in convenient boxes strong enough to sample on the outside. We are afflicted with the old foggy notion that in our line a better display can be made with goods than with shelving, and therefore we use our top shelf for storing back stock, making it serve as a fancy cornice, instead of investing hard cash in a wooden one.

The Stove Trade Outlook.

A few weeks since we presented in these columns an extract from *The Metal Worker* upon the trade outlook for the near future directing attention to the importance of all manufacturers being of one mind on the subject of maintaining prices. The question is one of such obvious interest to the whole stove trade as to warrant the president of the National Association of Stove Manufacturers in addressing the members of that body through the medium of a circular letter, a copy of which we take pleasure in presenting herewith:

THE NATIONAL ASSOCIATION OF STOVE MANUFACTURERS. PRESIDENT'S OFFICE. DETROIT, MICH., AUGUST 30, 1888.

To the Members of the National Association of Stove Manufacturers.—DEAR SIR: It is with no small degree of pleasure that I feel able to congratulate you on having so well sustained the prices of your productions, especially as the volume of this year's trade has so far been a disappointment to many.

The present indications are that there will be a large demand for stoves before the close of the season, and that, on the whole, the year's business will reach its normal volume. The crop reports are especially encouraging, the total production of grain being estimated at not less than 2,000,000,000 bushels. Business throughout the country is reported fair; money circulates well, and the probability is that the demand for our goods will yet be such as will be sufficient to prevent any overstock at the end of the year. Under these conditions, there being no necessity for uneasiness through delay in marketing stoves, I recommend each manufacturer to act firmly and consistently in the maintenance of at least present prices, knowing that they are not excessive, and are such as will afford him only a fair profit for the services he renders to the public in supplying it with so necessary an article as the stove. A little impatience, a little precipitation now, may affect the market disastrously and produce results that all would deplore. I therefore urge you to maintain your prices firmly and not to allow yourselves to be influenced by hearsay statements of concessions made by competitors. It is of importance to hold the market steady. There is nothing to warrant a reduction. It is true that pig iron is a little lower than it was last year, but very little—not so much so as to effect any appreciable reduction in our cost, and the decrease is more than offset by advances in other items which necessarily enter into our productive expenses. All other articles are at least as high as they were, and certainly wages are fully up to last year's standard. Stoves cannot be made cheaper in 1888 than they could in 1887. I am desirous of corresponding with each and every manufacturer of stoves, whether a member of our National Association or not, and of receiving any suggestions on subjects connected with our trade. I shall feel under obligations to those who will favor me with their views, especially to those who interest themselves in matters connected with our association. Yours respectfully,

GEORGE H. BARBOUR, Pres't. N. A. S. M.

English Steel Sheets.—English manufacturers of steel sheets will have to send better samples of their work to this country than they are now forwarding if they hope to build up a trade here. A trial shipment, ordered some time since by a Chicago consumer, was received last week and proves to be anything but satisfactory. The sheets do not lie flat, and in many instances they are badly buckled. Some of the sheets have huge protuberances in them which look as though the sheets had been piled on stones. The surfaces are finished very roughly. In no respect do they compare at all favorably with American steel sheets of the same grade, width and gauge. The purchasers are disposed to content themselves with the result of this attempt at importing cheap foreign stock, and American manufacturers have correspondingly risen in their estimation.

BRAZIL.

PARA. August 31, 1888.—*India Rubber*.—August shipments have been large to England and comparatively light to America—say only 155 tons.—*Per cable direct*.

CHILI.

VALPARAISO, July 6, 1888.—*Copper*.—The entire output for July and August has been sold to arrive, sales being limited to 6236 quintals on the spot at \$28.80 @ \$29.45, the outside figure equaling \$74.11 1/5, with 27/8 freight per steamer. *Nitrate*—Has been neglected during the fortnight, still producers have made concessions only in a few instances, and 383,500 quintals have changed hands at \$2.70 @ \$2.82 1/2, the inside figure equaling 8 2/3 % cwt., with 27/8 freight. June shipments amounted to 29,000 tons to Europe and 4000 to the United States; the charters during the fortnight were 56,800 tons for the former and 900 tons for the latter. *Coal* continues stiff at 55/ @ 60/, Newcastle, on the spot, and 48/ @ 50/ for April shipment, 44/ May and 37/ June. Australian, July shipments, 37/. *Exchange*, on London, 90 days, 26d.—*Weber & Co.*

JAPAN.

YOKOHAMA, August 24, 1888.—*Petroleum*.—The arrival here of an English steamer with a cargo of Russian Petroleum from Batoum has caused a decline in the price of American Petroleum in this market.—*Per cable direct*.

EAST INDIES.

SINGAPORE, July 6, 1888.—*Tin*.—There have been sold during the week some 200 tons at \$29.75 @ \$30.50, the market closing firm at \$30.75 buyers. During the first six months there have been shipped to England 91,146 piculs, against 34,610 in 1887 and 29,213 in 1886; to the Continent respectively 7594, against 15,095 and 12,326, and to the United States 12,783, 30,869 and 14,784. *Gum Damar* has been drooping; £15 has been paid for Banjar, \$20 for Palembang and \$17.50 for Mixed, while *Gum Copal* has been selling at \$7 @ \$12. *Gutta Percha* has been in active request at \$105 for good quality red; finest at \$108 @ \$110, and inferior may be had at \$23 @ \$35. *India Rubber*.—Borneo has slightly declined; a small business has been transacted in Ordinary at \$33 @ \$34.—*Giffilan, Wood & Co*

SINGAPORE, August 15, 1888.—*Tin*.—There have been shipped from the Straits Settlements to the United States during the fore part of this month 150 tons, against 450 during the corresponding period of last year, and to England 500, against 1000. The total shipments since January 1 to the United States sum up 1300, against 3250, and to England 11,100, against 8000.—*Giffilan, Wood & Co., to Charles Nordhaus, New York, per cable direct*.

MANILA, August 20, 1888.—*Hemp*.—Buyers at \$10.25 @ picul, against \$10.62 1/2 same date last year; this equals £33.15/ @ ton, cost and freight, and £35.10/ respectively. There were no clearances for the United States during the week, while last year 5000 bales cleared, and since January 1 99,000, against 138,000, leaving loading for ditto 10,000 bales against 22,000. The clearances for England since January 1 have been 230,000 bales, against 140,000; loading for do. 4000, against 6000; cleared for all other ports 47,000, against 27,000; receipts at all ports since last cable 4000, against 14,000; do., since January 1, 367,000, against 301,000 last year and 258,000 in 1886. *Freight*, \$6, against \$8. *Exchange*, 3/5, against 3/5 1/4.—*Ker & Co. to Charles Nordhaus, New York, per cable direct*

COLOMBO, July 12, 1888.—*Plumbago*.—Has been moderately active at well sustained figures, as follows, in rupees per ton: Large lumps, 145 @ 170; Ordinary ditto, 125 @ 150; Chips, 80 @ 95, and Dust, 40 @ 65. Since October 1 the shipments to England sum up 61,676 cwt.; to Marseilles 38 cwt.; to Trieste, 523; to Hamburg, 7415; to Antwerp, 3850; to Bremen, 1012; to India, 82; and to the United States 128,329; together, 202,434, against 183,331 in 1887, 142,329 in 1886 and 155,606 in 1885.

Coir Yarn has remained unaltered at 7 @ 12 rupees @ cwt. Nos. 1 to 4. *Exchange*, six months' sight on London, 1/4 1/2.—*Volkart Bros. through their Agent, John W. Greene, 82 Wall street, New York.*

AUSTRALIA.

MELBOURNE, VICTORIA, August 9, 1888.—*Iron*.—A decline has taken place in several articles. We at present quote Galvanized Iron, £16. 5/; Fence Wire, £9. 10/, and Scotch Pig, £4. 15/. Considering the dull season, sales have been tolerably brisk. *Tin*.—Shipments during the fortnight from the Continent and Tasmania only amounted to 150 tons.—*Per cable via Europe*.

CHINA.

SHANGHAI, July 3, 1888.—*Copper Coin*.—Copper Coin, the only fractional coin in circulation, is getting scarce in China, and the Government has bought Copper for increasing the coinage; new mints have been established for the purpose. There is some curiosity existing as to whether the new coin is to have its full face value. If the coin contains nearly all copper it is retained by the people and melted down; if too little there will be counterfeiting, and quite a number of private mints will begin to operate, at the establishment of which the Government did not take umbrance in former years.—*Chinese Herald*.

SPAIN.

BILBAO, August 11, 1888.—*Iron Ore*.—Only a few single cargoes have changed hands at 6/10 @ 7/3 Rubios, and 7/6 @ 8/ Campanil. As freights have been improving here it is likely that the number of vessels in search of cargo will soon increase in our port. Total shipments since January 1, meanwhile, sum up 2,363,372 tons, against 2,772,905 last year. *Pig Iron*.—There were exported during the week 2605 tons and shipped coastwise 600. We quote, spot, 57 @ 60 pesetas; futures, 55 @ 58, and Lingotillo, at Huelva or Seville, 65.—*Bilbao Maritimo y Comercial*.

GERMANY.

HAMBURG, August 25, 1888.—*Iron*.—Our Dortmund correspondent writes as follows: The increase in the stock of Pig Iron in Rhenish-Westphalia for the month of July has only been 8200 tons. Spiegel has been taken for American account to the extent of 10,000 tons, 20 % cent., which will keep busy four of our largest blast furnaces for six weeks to come. The price submitted to make the sale has been an exceedingly low one. Ten to 12 % cannot be quoted any higher than 54 marks @ ton in the open market. The Siegen rolling mills have, by this sale, been induced to buy their Forge Pig, getting it 3 marks cheaper than Rhenish-Westphalia was prepared to sell them. Bessemer has been rather dragging; Luxembourg Forge Pig is now fetching 40.30 marks; English Bessemer, 43/6. Merchant Iron has been slightly looking up both for home use and for export. Some rolling mills sold all the way into the fourth quarter. Specifications are also coming in more readily; makers are thus kept very busy, and the entire situation is an improved one; only hoop manufacturers stand in need of an export trade for the moment. Boiler Plates continue in brisk demand, thin sheets remain neglected. Wire Nail manufacturers are busier now at a decline of 1 @ 2 marks; Wire Rods are so low that to trade them would be attended with downright loss. Foundries, machine and car shops are all profitably engaged. Railroad material is moderately active.—*Borsenhalle*.

Steam car heaters will be in use on many important lines of railroad the coming winter. The entire Vanderbilt through passenger service will be equipped with engine steam heaters and the car stove abandoned. On the New York Central of its 900 passenger coaches all but about 50 are now equipped with the new heaters. The Boston and Albany is similarly equipped. For the present only the Lake Shore through trains will be provided with this new device. The Michigan Central and the Nickel Plate trains also will be equipped with steam heaters. The cost of fitting out coaches with these heaters is about \$200 each, and the expense of adapting the engines to this new service approximates the same figure. The draft upon the engine's steam is not noticeable.

The Ohio Falls Iron Works, New Albany, Ind., made an excellent run during August, not losing one day in the month. In sympathy with the trade, they have ad-

vanced prices on several sizes that were cut too low by competitors. The outlook for their fall season is good, with plenty of orders ahead.

Natural Gas Charges.—An interesting suit, the result of which will possibly determine the question as to the right of a natural gas company to charge one consumer more than another for fuel was commenced in the courts at Pittsburgh last week. The suit in question is that of the Farady Carbon Company, of that city, against the Philadelphia Natural Gas Company, for \$160.70, claimed to be overcharges for natural gas consumed by the plaintiffs. The works of the company are located in the Fifteenth Ward, in Pittsburgh, and they allege that when they negotiated with the Philadelphia Company for natural gas, which was necessary to the manufacture of their specialty, carbon points for electric lights, the agent of the company would not furnish them gas at a less rate than 85 cents per 1000 carbon points manufactured, equal to a rate of 16 cents per 1000 cubic feet of gas consumed. The plaintiffs further allege that the Philadelphia Company, by reason of illegal arrangements with other natural gas companies, were able to compel them to accept this rate under the threat that if they refused to pay it the gas supply would be shut off. During the month of July the plaintiffs manufactured 271,287 carbon points and for that month were compelled to pay defendants \$230. They claim that this price is exorbitant and greatly in excess of the rate charged other consumers, and that another factory which adjoins theirs pays 5 cents per 1000 cubic feet. They ask that the defendants be compelled to return the \$160.70 overcharged and that they also be compelled as public carriers to furnish them gas at the same rate as other consumers are charged. The outcome of the suit will be awaited with considerable interest, not only by the consumers of natural gas, but by the producers as well.

Pittsburgh Freights.—A meeting of the Pittsburgh committee of freight agents was held in that city last week to arrange the new rates from Pittsburgh to Mississippi River points, which go into effect on Monday, the 17th inst. The rates apply to points north of St. Louis, not including the latter city, and no change has been made to places that take a less rate than the Peoria rate. From Pittsburgh to Davenport, Burlington, Dubuque and Keokuk the new rates will be as follows: First-class, 66; second, 58 1/2; third, 44 1/2; fourth, 32 1/2; fifth, 28; sixth, 23 1/2; iron, in less than carloads, 24 1/2; in carloads, 19 1/2; to Quincy, 62, 54 1/2, 40, 29, 25 1/2, 21 1/2; iron, less than carloads, 24 1/2; carloads, 18; to Hannibal, 66, 59, 45, 33, 28, 23 1/2; iron, in carloads, 20; less than carloads, 24 1/2.

The new Chicago, Burlington and Quincy steel railroad bridge at Nebraska City, Neb., was formally opened on Thursday. The bridge cost \$1,500,000.

The railroad companies have given notice of an advance in freights on the 15th inst. on old rails and scrap iron between Chicago and Eastern points. The rate per ton to Cleveland will be \$2, to Youngstown \$2.25 and to Pittsburgh \$2.50. This is an increase of 40 cents to Cleveland and Youngstown and 50 cents to Pittsburgh.

Pythagoras Hall, the local headquarters of the Knights of Labor in New York, it is reported, will go into the hands of a receiver.

Tropic furnace, in the Hanging Region, started on the 30th ult.

New Corn Popper.

The Fred J. Meyers Mfg. Company, Covington, Ky., are introducing to the trade, among other seasonable specialties, a new revolving corn popper, illustrated in the accompanying engraving. The popper consists of a meshed wire cylinder 5 inches long and 13 inches in circumference, the ends being closed by metallic

New Corn Popper.

disks through the center of which, and a bracket arm attached to a suitable handle, passes a crank-shaped rod. Attached to this crank is a long wire rod by means of which the cylinder is revolved as slowly or as rapidly as may be desired. One of the metallic disks, as shown in the illustration, is provided with a lid held in proper position by means of a small catch. The advantages claimed for the new popper are lightness, durability, and the production, by reason of the revolving motion, of more uniform results in popping corn.

The Prier Self-Closing Basin Cock.

The accompanying cut shows a sectional view of the Prier Self-Closing Basin Cock, manufactured by T. Wortley & Co., of Kansas City, for whom Frank M. Potter, 37 Howard street, Newark, N. J., is the general agent for the Middle States. A special feature of these faucets is that they

The Prier Self-Closing Basin Cock.

close with the pressure, which is held to be the only correct principle. The goods have no metal springs to relax, open easily against any pressure, and it is said always close positively even without pressure. The spout of the faucet is so constructed that no water will remain in the body of it when closed. The cushions and valves are made of the best quality of rubber and

adapted to hot or cold water. The cushions, it will be observed, answer a double purpose, that of serving as a packing and also preventing all water hammering. The goods are said never to leak at the stem. It is further noted that the cam which throws the stem down and opens the valve is solid, and consequently very durable. The value of these goods is attested by numerous testimonials from many Western

users. We are informed that the manufacturers have just placed an order from the Pullman Palace Car Company for over \$6000 worth, and we understand that they are to put them in all their cars. The faucets are made in all ordinary forms and shapes required in plumbing work.

Self Extinguishment of Fires.

A correspondent of *Engineering*, writing under the above head in a recent issue, says: There are numerous instances where fires have been extinguished through causes connected with their origin, and so completely outside of precedents that they serve as instances of the happening of the unexpected. In this connection we do not refer to the fires extinguished by automatic sprinklers, where the result is clearly what has been expected to happen. Notwithstanding the fact that when a fire occurs on property protected by automatic sprinklers, those present avail themselves of all the means of grace in the shape of the usual fire apparatus at hand, yet there are numerous instances where fires have occurred at night or in rooms vacant at the time, where the fact has been made known only by water percolating through the floors, or the sound of the automatic fire alarms, or from the sprinklers which have already come into active operation, the fire having called down means for self extinguishment. But the instances which we have in mind are those where the means of extinguishment were not expected, as in the well-known cathedral building in Boston, where a fire, caused by spontaneous ignition in a storeroom, melted the lead water-pipes, and the water issuing from them extinguished the fire. A similar instance happened in a building in Market street, Philadelphia. Some sheet mill pails were returned by the purchaser to a tinsmith in Chester, Pa., with the complaint that they were not tightly made. The manufacturer resoldered them, and in order to test his work filled them with water and hung them upon hooks at the ceiling. While the men were at dinner during the noon hour, a fire heated the upper part of the room so that the bails connecting the handles to the pails became unsoldered, and the dropping of the pails of water dashed out the fire. Some waste left upon the top of a steam pump at Watertown, Mass., blazed from spontaneous ignition, and this in turn set fire to the lagging around the steam cylinders and the feed-pipe, where it melted the soldered attachments of a continuous automatic oiler. The steam from the feed-pipe was discharged through the small tubes formerly leading to the oiler, and extinguished the fire. There have been numerous instances of fires which have ceased for want of air. During the war of the rebellion attempts were made to burn New York City, as the

result of a conspiracy fires being started in several hotels; but in order to prevent premature detection the culprits closed up the rooms so tightly that the fires were smothered. At a hotel in Woonsocket the steam pipes caused a fire in the spaces in the walls of the building, which was extinguished for want of air to support combustion. The time of the fire is unknown, as its occurrence was not discovered until some time afterward, when in the progress of an alteration to the building the facts were made apparent. It may be interesting to know that in this instance the steam-heating service was ordinarily used at a pressure of about 4 pounds to the square inch during the coldest weather, and that the safety valve was so arranged that the pressure could never exceed 10 pounds. A spark of static electricity proceeding from a belt ignited leaking gas, and this in turn set cotton on fire, which operated the automatic sprinklers and extinguished it. An attempt was made to destroy a block of new dwellings at Brooklyn, Mass., before the buildings were entirely finished. Some people, alarmed by the smoke which was seen in each division of the structure, rushed in to save doors and portable fixtures, when it was noticed that the fires did not appear to gain any headway, and when the smoke had entirely died away it was found that the incendiary had placed lighted candles in sawdust and other inflammable material in drawers and closets, but with such limited supplies of air that combustion could not be supported and the fires became smothered.

Circus Bank.

The Shepard Hardware Company, Buffalo, N. Y., are putting on the market a new toy bank, which is named the Circus. It is represented in the accompanying illustration, from which it will be inferred that it is operated by a crank, which causes the revolution of the ring with the pony and clown. The penny is placed on the bracket in such a position that the hand of the clown strikes it and causes it to fall into the bank. In connection with

Circus Bank.

the mechanism for revolving the pony there are contrivances causing the pony to kick up, the wheels to turn and the clown's arms to move up and down, making an amusing toy. The money is removed from the bank by means of a locked opening, for which a key is furnished. The dimensions of the Circus Bank are as follows: Height, 4½ inches; length, 8½ inches; width, 7 inches. It is made wholly of iron and highly polished in brilliant colors.

Interesting testimony respecting the Alaska fur seal fisheries was given before a Congressional committee in Washington last week by C. A. Williams, of New London, Conn., a member of the Alaskan Fur Seal Company, who hold a lease of the seal islands St. George and St. Paul. With an idea of presenting to the committee the actual profit derived from the seal fisheries

Mr. Williams presented a table showing that during the 16 years from 1872 to 1887 there were reshipped from London to New York dyed seal skins amounting to 825,000. The skins were sold in London in the spring and the fall of the year at market prices, and were not kept on hand to secure good prices. On these reshipments the Government collected a customs duty of \$3,123,788, or an average of \$195,236 yearly. This, added to the leased tax of

as a large counter show case. The wooden framework of this revolving case is covered with plush, and two glass doors enclose it, permitting easy inspection of the contents while preserving them from dust and the injurious action of the atmosphere. The cutlery hangs in small racks against a velvet background. A brass-headed nail under each article enables a price tag to be hung in immediate connection, which obviates the necessity of marking the cutlery it-

Hull's Coffee Roaster.

At the present day, when the practice is so generally observed of housekeepers roasting their own coffee, devices for this purpose are meeting with a demand sufficient to warrant retail dealers keeping coffee roasters in stock. As the great majority of people do not care to roast more than a pound or two at a time, small capacity roasters are preferred to the

Fig. 1.—Cutlery Case, General View.

Fig. 2.—Cutlery Case, Showing Interior.

\$55,000 per year and the additional tax imposed of \$2.62½ on each skin taken, raised the annual sum realized by the Government to \$512,736. In the whole time the company had the privilege of taking seals the company had paid over \$8,000,000 to the Government, or a sum exceeding by over \$1,000,000 the price paid by the Government for the whole of Alaska, with the seal islands included. Mr. Williams said the company would prefer that the Government lease the privilege of taking the seals, because the prestige of the Government served as a protection from hostile parties and marauding seamen. The season's catch, just arrived at San Francisco, comprises 100,000 skins, valued at \$2,000,000.

The Union Cutlery Company's Show Case.

The Union Cutlery Company, controlled by Horton, Gilmore, McWilliams & Co., of Chicago, have gotten up a line of show cases which they furnish free to cutlery and jewelry purchasers when their orders cover a certain amount. So unique are these cases, and so admirably are they adapted to the purpose of displaying goods of this character, that we present herewith illustrations showing their design and interior construction. The case selected for illustration is hexagonal in shape, stands 2½ feet high, requires but a foot square of space on a counter, is made to revolve at a touch of the hand, and will hold as large a quantity of pocket knives, scissors, &c.,

self, to its injury. One of the illustrations shows the case closed and the other shows it open, disclosing pigeon holes in the interior of sufficient capacity to carry a stock of 36 dozen pen and jack knives and 15 dozen scissors and shears. The inside doors of the case are fastened with neat brass hooks, but the outside glass doors have handsome locks. These cases are intended to stand on counters, and they form not only a very convenient receptacle for goods but also a most attractive ornament to a store. Special cases are made for jewelry. They are of somewhat similar design but of smaller size. The chain cases hold two dozen watch chains. The frames are covered with plush and the inside is lined with velvet, forming a very effective background for the chains.

A Canadian commission is at Buenos Ayres, investigating Argentine commerce, and, as the Canadian Government has voted a subsidy for a steamship line direct to Buenos Ayres, it is thought the two countries can do some trading.

Heat, Light and Power, of Philadelphia, well known as the progressive representative of the gas industries, announces that it has become a weekly journal. Mr. George W. Graeff, Jr., continues as managing editor.

According to the *Electrical Engineer*, Mr. E. Blass, a German scientist, has used an incandescent lamp for actual inspection of the inside of boilers under steam.

larger ones. In order to meet what appears to be a well-defined demand, Mr. M. L. Hull, of Cleveland, Ohio, has brought out a coffee roaster of 1 pound capacity, a general view of which is shown in the accompanying illustration. It consists of a cylinder of perforated metal supported by two standards having a stove lid as a base. The cylinder is turned by means of a crank clearly shown in the cut,

Hull's Coffee Roaster.

and it is claimed that coffee can be roasted in from 15 to 20 minutes. It is designed for use on gasoline stoves, but will work with equal satisfaction on coal or wood-burning constructions. The perforations are small, yet of sufficient size to enable the operator to see the coffee as it is roasting. When the coffee is thoroughly roasted it may be allowed to remain in the roaster while cooling, or it may be turned out, as preferred. The roaster shown above has a capacity of 1 pound.

Plumbers' Torch.

A very convenient torch for bench use of any kind, as well as for plumbers, is being offered the trade by M. L. Hull, of No. 50 Long street, Cleveland, Ohio. A very good idea of its general arrangement and construction may be gained from an inspection of the engraving presented herewith. It is shown arranged for using gasoline as a fuel, although it can be supplied with a coal oil torch burner if desired. The handle is hollow, and furnishes the air to the burner. It is only necessary to compress the handle a few times to maintain a steady, bright light. The manufacturer claims that this torch is especially adapted for plumbers' use in working in dark corners where it is difficult to secure a good light. It is also designed for use by railroad men about freight yards, for inspection of car wheels and other work

Hull's Plumbers' and Bench Torch.

about railroad stations. The broad, flat base of the gasoline reservoir forms a good foundation, and adapts it for bench use of almost any description. It is well built, compact, and is offered the trade at a reasonable figure.

The Merchant Steel Association.

The regular monthly meeting of the Merchant Steel Association of the United States, composed of the open-hearth and crucible steel manufacturers, was held in the Monongahela House, Pittsburgh, on Wednesday, the 29th ult. There was a very fair attendance, considerably more than half of the members being represented. The different reports were read, and a general discussion on the condition of the trade took place. It was admitted that the steel trade was in very satisfactory condition, with good prospects for the future. The extras adopted at the meeting held on June 1, last, and published in a subsequent issue of *The Iron Age*, were reaffirmed. No other business was transacted. The next meeting of the association will be held at the call of the secretary.

Southern Pig Iron Rates.—The Queen and Crescent Route, via the Alabama Great Southern and the Cincinnati Southern Railways, has issued a supplement to tariff No. 7, giving new rates on pig iron to Burlington and Davenport, Iowa, and Moline and Rock Island, Ill. The rate to these points from Chattanooga, Rising

Fawn, Florence and Sheffield is \$4.75. From Dayton and Rockwood it is \$4.55. The rate from Attalla, Bessemer, Birmingham, Gadsden and Wheeling, Ala., to Burlington, Iowa, is \$5, and to Davenport, Moline and Rock Island, Ill., \$5.02.

The Columbia Rolling Mill.

Last month the Columbia Rolling Mill Company opened their new works on the corner of Fourteenth street and Jersey avenue, Jersey City, N. J. The Columbia Rolling Mill Company were organized under the laws of the State of New Jersey. The capital stock of the company amounts to \$500,000 and is divided as follows: Common stock, \$400,000; preferred stock, \$100,000. There are 100,000 shares at a value of \$5 per share, which is fully paid and unassessable. The following gentlemen are the officers and directors: Jesse Larrabee, president, who is also a director of the Pennsylvania and Slatington Railroad; Weeks W. Culver, vice-president, who is also treasurer of the Barnegat and Long Beach Improvement Company, of New York; John M. Guiteau, ex-Judge Advocate of the U. S. Navy; Silas B. Dutcher, president of the Union Dime Savings Bank, of New York, and W. L. Brockaway, directors; W. A. Crawford, secretary; R. I. Powell, treasurer, and W. L. Brockaway, general manager. The company, succeeding to an established business of over five years' growth, were organized for the purpose of utilizing and manufacturing from waste material, which can be gathered in all large cities, what is called taggers iron, taggers tin and ferro-type plates.

The new buildings of the rolling company occupy six lots of ground. There are four buildings used in the business. They are 75 x 100, 50 x 100, 20 x 25, 30 x 25. This same company has been in successful operation on Goerick street, New York, for a long time. Owing to the increase in their business they moved to Jersey City in order to have more room. They will employ a force of about 100 men when they get in complete working order. Two 75 horse-power boilers will be put in the building and two 50 horse-power engines, besides four chilled-iron rolls.

The process employed for producing a valuable product from waste material of this character is very simple, consisting essentially in heating the material from three to five minutes, which has the effect of burning off all extraneous material and rendering it suitable for further treatment. In the bottom of each of these heating furnaces is a small hole, which allows the solder or lead to run into a receiving basin. About 200 pounds of lead is thus obtained from a ton of waste material. This lead is sold at a price not exceeding 16 cents a pound. But it is now proposed by the company to manufacture this tin into what is called putty powder. This will then bring a price of about 90 cents a pound. This putty powder is principally used for polishing marble.

After the waste material has been taken from the furnace and allowed to cool, the scrap is sorted, the smaller pieces being thrown out and used for other purposes, such as lids for blacking boxes, &c. The sheet metal is now passed under a rubber coated roll, which flattens it out, the rubber being used so that the sheets are not hardened, which would require them to be annealed. The metal, in packs containing several sheets each, is next passed between chilled iron rolls, which reduce the thickness. They are then annealed and repressed through the same rolls and trimmed up to the finished size, after which they are given their final annealing, when they are sorted and ready for shipment. The taggers iron, as thus produced, may now be further finished by being japanned, tinned,

galvanized or otherwise treated, depending upon the use for which it is designed to be put.

Adding to the Water Supply of Chicago.

Preparations for the launching on Lake Michigan of the caisson for the new crib, which will add to the water supply of Chicago, are being actively pushed. Two hundred and fifty tons of steel were used in the construction of the caisson. It is a double steel shell, 54 feet in height, the outer shell being 75 feet and the inner one 31 feet in diameter. The caisson will rest on four scows. It will be towed 2½ miles out in the lake, when the work of sinking it will begin.

The engineer thinks that it will settle at least 3 feet on account of its weight. However, the space between the inner and outer shell will be filled and packed with sand. Then by means of chains, hydraulic power and hoisting engines, the caisson will be lifted off the scows and lowered into the water. Four series of soundings have been made and have proved successful. When the caisson will have reached the ground two divers with hose and nozzles of great power will walk around the structure and tear up the ground so that there will be no difficulty in its sinking. If this does not prove successful the crib will be loaded down with rock. The place selected for the sinking of the shaft is considered by the engineers the safest. The depth of the lake at this point is 42 feet. This will leave the caisson about 9 feet above the level of the water. The shaft will be sunk inside the caisson, commencing from the top and building downward. The shaft will be 10 feet wide. On either side of the shaft in the crib will be three floors. The upper one will be of cast iron. Apartments will be fitted up on the first floor for the laborers, who will remain there during the winter months. The second and third floors will be used as storage rooms for hoisting and hydraulic machinery. It is also the intention of the contractors to have a dynamo on one of the floors in order to light the shaft and apartments by electric light. Four crews of 50 men will be quartered in the caisson. The contractor will have a tug commissioned to run between the shore and the crib, making two trips by day and the same at night. The shaft sunk inside the caisson will form an inlet for the lake water, which will flow through it into a tunnel connecting with the pumping machinery on the shore, by means of which the water will be distributed throughout the city.

Another very fine swing bridge has just been completed at Chicago. It was built by the Keystone Bridge Company and crosses the Chicago River at Jackson street. The turntable of this bridge is built on the side of the river channel, and the bridge is long enough to swing over a number of railroad tracks running alongside. It is built of steel, and is 280 feet long, 59 feet wide and 36 feet high, and the footways are 7 feet wide and the roadways 16 feet. It weighs about 700 tons, and the engine about 150 tons more. The engine is 15 horse-power. The floor of the engine-house is fire-proof. The bridge moves so easily that two men could turn it by the hand-key. It cost \$131,632.67.

The Augusta National Exposition which will open at Augusta, Ga., on October 10 and close on November 17, will be the largest that the South has ever held. Preparations for it are now being vigorously carried out and give promise of a successful issue.

CURRENT HARDWARE PRICES.

SEPTEMBER 5, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

THE IRON AGE

THURSDAY, SEPTEMBER 13, 1888.

New Horizontal Boring Mill.

The E. W. Bliss Company, of Brooklyn, N. Y., recently built for their own use a horizontal boring mill which, however, is adapted to general shop work, and may therefore be of some interest to our readers. Accordingly, we present in this issue elevations and several details illustrating the principle features of the tool. By its use holes may be bored parallel to each other in heavy work without resetting the work, and without "traveling" the latter

screws S S, by means of which the positions of the head and tail blocks can be quickly adjusted, and in a manner similar to that used to raise or lower a planer crosshead. To compensate for any possible variation in the two vertical adjusting screws, a slight independent adjustment is provided in the tail block, so as to bring the boring-bar dead true with the bed. The driving cone pulley P is made with four steps instead of three, as shown in the details, and a heavy back gear is attached to the spindle, thus giving eight

2 are thrown into gear, and the motion from A and M is then carried to the larger of the upper wheels, thence to the smaller one, the two being on the same shaft, and finally down again to the wheel N and the spindle G. The driving belt, it will be noticed, is arranged in a rather striking manner, passing from the pulley B, first over the two idlers F F, then over the spindle pulley A, and thence back around B. This allows the raising and lowering of the head-block without entailing any difficulty with the belt, requiring no change of

Fig. 1.—General View.

NEW HORIZONTAL BORING MILL, BUILT BY THE E. W. BLISS CO., BROOKLYN, N. Y

during the process of boring, and it is so arranged that, while built especially for heavy duty, it can be used to great advantage on light work, as all hand-wheels and levers are convenient to the operator in his position on the right-hand side of the machine.

The table is 7 feet long by 3 feet wide, and can be "traveled" to bring the work in position by means of a rack driven by power. This is thrown in operation by the lever C (Fig. 3), and which operates a bevel wheel clutch through the intervention of the rod D. The clutch wheels are mounted on a short shaft which takes power from the driving shaft and pulley B, in the manner shown. A second bevel-wheel clutch, controlled by the lever C', enables the operator to impart motion in either direction, through a spur-wheel attachment, to a transverse shaft E (Figs. 2 and 3). This, in turn, works the elevating

speeds for the bar. A cross-section of the spindle back gear arrangement is given in Fig. 4. The pulley A, it will be observed, is secured to a collar with a pinion M cut on its end, and capable of turning loosely on a bush on the spindle G. The gear N, on the other hand, is tightly secured to this bushing, which itself is secured to the spindle G by a groove and feather arrangement, so that while the bushing may move freely along the spindle it must impart to it its rotary motion. When running in single gear, therefore, the gear N is secured to the pulley A by the bolts shown, and partakes of its motion, transmitting it directly to the spindle G. The pinion M is not in gear with any wheel during this time. In running with the back gear, however, the bolts holding the wheels N and A together are loosened, permitting of their free and independent motion. The two upper gear-wheels shown in Fig.

length. The spindle carrying the boring-bar is of steel, $3\frac{1}{4}$ inches in diameter and has 24-inch feed lengthwise. It is carried by a head with 60 inches vertical adjustment upon a strong upright securely attached to the bed and the cutter end of the bar is supported through a bush carried by the tail-block upon a similar upright at the left of the machine. The spindle is fed forward by a rack and pinion driven by a worm gear, W W', and so arranged that the latter may be thrown out, allowing the bar to be run back quickly by hand. This feeding device is driven through gearing from the main spindle and has four rates of feed. This detail of the arrangement is shown in Fig. 5, the feed-wheels K (Fig. 2) being loosely mounted on the feed-spindle and secured individually, as many desired, by a feather, b, moved along a slot in the spindle by the milled head a. When the feed-wheels

are out of gear the attendant may feed the spindle along by hand through the hand-wheel L (Figs. 2 and 3), which, as shown, is mounted on the feed-spindle and controls the worm W and worm-wheel W'. The end of the spindle rests in the support H, which, as noted, is furnished with a rack underneath.

The extreme width of the tool in the clear, between head and tail blocks, is 8 feet, and its weight is 26,000 pounds

Jointing Phosphor-Bronze Wires Without Heat.

One of the greatest difficulties in connection with the use of phosphor-bronze wire, or indeed of any wire of copper alloy

would of course be still greater with phosphor-bronze wires, owing to the greater affinity of tin and copper. The best substitute for solder is a copper amalgam prepared as follows: Freshly precipitated copper oxide is heated in a tube in a stream of hydrogen until it is reduced to metallic copper. When thoroughly cooled this fine powder is moistened with dilute sulphuric acid and well mixed with mercury, and is then washed. A simpler plan, though not such a good one, is to obtain the copper powder by reducing copper sulphate by means of metallic zinc. In making use of this amalgam for jointing wires it is pressed closely round them and allowed to set. On this account a twisted joint is not very well adapted; a Britannia joint is better,

sition at Milwaukee opened at the same time, and intends to contest with the Chicago exposition for the honor of having the best display of exhibits. According to the Milwaukee newspapers the local manufacturers and business men have entered with great spirit upon the work of making a creditable showing for their city, and the exhibits are greatly praised for their variety and attractiveness. St. Louis also entered the lists on that day with its great industrial exposition, which has always won honors, and will surely not be found lagging in the rear this year. The St. Louis exposition is only one of a series of attractions gotten up every autumn by the residents of that city in order to call the attention of strangers to their business advantages and capabilities. The autumn-

NEW HORIZONTAL BORING MILL, BUILT BY THE E. W. BLISS CO., BROOKLYN, N. Y.

possessing hardness and great tensile strength, has been in the making of joints. In the ordinary manner of soldering, the heat has been found to be deleterious, and even with ordinary hard-drawn copper workmen find a difficulty in making satisfactory joints. In the "Journal of the Society of Telegraph Engineers and Electricians" an abstract is given of a foreign technical journal, which describes a method for jointing phosphor-bronze wires without any application of heat, which appears of a sufficiently interesting character to deserve the attention of our readers. The abstract states: "It is very desirable to avoid by all means the heating of phosphor-bronze wires, and, consequently, some means of jointing had to be sought for to replace the method of soldering used for iron wires. Moreover, experience has shown that some local action is set up between the tin solder and the iron wires, which in time leads to a weakening of the joint; such an action

as the amalgam penetrates inside the binding wire. But the best joint is made with a tube connection, the two ends of the wires being turned up at not too sharp an angle and secured with binding wire; the amalgam is then pressed well into the tube, where it sets quite hard. No details of this cold joint are given as to the points of strength and durability, which are highly material in judging of a successful joint."

The Interstate Industrial Exposition at Chicago was opened on the 5th inst. with much ceremony and in the presence of a very large attendance. The exhibits are unusually varied, showing that the public have not lost their interest in this annual display of the mechanical progress of the Northwest. The managers of the exposition look forward to a more successful season than ever, and they have put forth every effort to make the great building on the lake front attractive. The rival expo-

nal festivities of previous years are remembered with much pleasure by those who participated in them, and those who can will indulge in the repetition of a visit to St. Louis this season, especially when the crowning attraction, "the Veiled Prophets," present their pomp and pageantry.

Westinghouse, Church, Kerr & Co., are issuing from their Chicago office, 156 and 158 Lake street, a neat little pamphlet, descriptive of their Westinghouse automatic and junior Westinghouse automatic engines. A unique feature of the pamphlet consists in its being a "double ender." Half of the contents being devoted to each engine; they are printed the reverse of each other, so that whichever way the pamphlet is opened the first half is "right side up," while the last half is "upside down." This is done to attract the attention of the reader to both engines. The special features of the engines are compactly but very clearly stated.

Work on the Navy.

While the good work of building new vessels of war progresses, the old wooden ships are not being entirely neglected. According to the *Army and Navy Journal*, considerable work is being done at the various yards in the way of rebuilding and repairing a number of these now old but still useful craft. At the Portsmouth, N. H., yard the Kearsarge is being extensively repaired, and will be ready for her officers October 1. The estimated cost of the repairs to this ship will be \$47,792.26. At the same yard the training ships Saratoga and Portsmouth will be entirely rebuilt, at an estimated cost of \$68,000, and

greatest amount of work is being done. The Iroquois is nearly ready, and her estimated cost, when finished, will be \$29,400. She will be ready for sea September 15. The steamship Monongahela is also being overhauled and repaired at this station, at an estimated cost of \$25,000. She will be sent again to the South Pacific as store-ship of the station, with headquarters at Payta, Peru. She will be ready October 1.

The surveying steamer Ranger is being fitted for one year's service on the Pacific Coast at an outlay of \$9200, and is now ready to proceed with her work. The Mohican is now in the dry dock, and after some slight repairs are put on to enable

umn of gas extends about 15 feet above the mouth of the well, and early in the morning can be traced to the top of the derrick. The gas was struck at the depth of 1600 feet. J. Willison, of Warren, Pa., is the lessee, and it is understood that he is negotiating for its sale.

A High Bridge.—The Keystone Bridge Company, of Pittsburgh, have received a contract to erect at St. Paul, Minn., a bridge which, it is said, will be one of the highest in the world. It will extend from the end of the bridge, spanning the Mississippi River at St. Paul, across a flat to the top of a high bluff. There will be

Fig. 4.—Section of Back Gear.

Fig. 5.—Section of Feed Gears.

Fig. 3.—Side Elevation.

NEW HORIZONTAL BORING MILL, BUILT BY THE E. W. BLISS CO., BROOKLYN, N. Y.

will be ready about the first of the year. At the New York yard the Richmond is fitting out, ultimately to be the flagship of the Asiatic station, and will cost, when completed, \$20,596.94. She will be ready for sea in about two months from the present time.

At the Norfolk yard the Pensacola, which will be the flagship of the North Atlantic squadron, is being repaired, and the estimated cost to complete her entire is \$27,311. She will be ready in about five months. This ship will receive an entire new set of boilers, which are now being forwarded from the Washington Navy Yard, where they have been in store for some time. The double-turreted monitor Puritan will shortly be sent to the yard to be rebuilt, in accordance with an act of Congress approved August 3, 1886. The training ship Jamestown will also be repaired at this yard, at an estimated cost of \$12,000, and be ready in about three months. At the Mare Island yard the

ship to leave the dock, she will be repaired at an estimated cost of \$14,800, and be ready in 60 days. The Vandalia and Adams, of the Pacific squadron, are now on their way to the Mare Island yard for repairs, and it is expected both ships will be there by the middle of October. The double-turreted monitor Monadnock is being rebuilt also at the California yard, at an estimated cost of \$600,000, and will be ready in about two years.

A Large Natural Gas Well.—What is claimed to be the largest natural gas well in Allegheny County was struck a few days since on the farm of John M. Allison, in Richland township, and just about a mile southeast of Bakerstown. It is said to be fully equal to the McGugan well in Washington County, or the largest of the Murraysville wells. It has not yet been lighted or piped, and its roaring can be heard for eight or ten miles. A blue col-

about 20 spans, four of which will be 250 feet each in length, one about 170 feet, and the remainder from 40 to 90 feet. The ends of the spans will be supported on trestle bents, some of them being 150 feet in height. The bridge is to be of iron and steel, and the work will be especially heavy, as some of the pieces weigh many tons. The above firm have also received the contract for erecting the new Polk street viaduct and approach in Chicago. This structure will also be of iron and steel, and will be rather ornamental in design.

The Tudor Iron Works, of St. Louis, have issued a handsome catalogue of their manufactures, including rail joints, spikes, track bolts, square and hexagon nuts, two and four-bolt joints, light tee-rails, tram-rails, screw-bars, drift-bolts, bridge bolts, switches and frogs. A few useful tables, and a cipher for ordering goods are added.

The Buffalo Fair.

Too much cannot be said in praise of Cicero I. Hamblin and the men associated with him who have brought about the formation of the Buffalo International Fair Association. From the start they have given their money, time and skill to further its interests. They are about to reap the harvest of their unselfish labor, for the success of the fair is now assured.

The fair building is one of the finest for the purpose ever put up, and is alike creditable to Marling & Burdette, architects, and to the association. Not a dark corner is to be found in the entire building. All space is equally advantageous for the display of exhibits. The galleries from which the main floor can be viewed are wide enough to accommodate any reasonable number of visitors. Evidently the projectors have faith in their venture, for it is intended as a permanent affair, and, under their management, is likely to be as prosperous in the future as it gives promise to be now. Every facility for transacting business will be given on the grounds, including post office, railroad ticket office, telegraph and express office. Every possible means of transportation, both for passengers as well as exhibits, have been made, tracks having been laid up to the grounds.

The advantages to manufacturers resulting from a participation in this fair have been recognized. Judging from the interest shown by manufacturers in neighboring and distant States, and by the reduced railroad rates to and from Buffalo, there will be several million of visitors in the city from September 4th to 14th. It has been planned to have everything go off with vim and snap so that as much will be accomplished in two weeks at this fair as is usually done at others in one month. Enterprise is contagious, and all exhibitors will realize that a rush at once is much preferable to a long drawn-out and sleepy month of labored pleasure. All the trades will contribute to the exhibit, in many instances manufacturing operations will be carried on in the building. The local manufacturers are rivaling one another in their efforts to gain recognition for their goods, and those out of the immediate vicinity are no less concerned.

The proximity of Hamilton, Toronto and London, Ont., enables Canadian manufacturers to exhibit. This will naturally draw on thousands of Canadians. The largeness with which all arrangements are being made impresses itself on one. The *Buffalo Express*, one of the enterprising papers of this part of the country has taken 3000 square feet of space to show the entire process of making a newspaper, of which two editions will be published in the building daily. The minutest operations will be performed in full view of all who care to interest themselves in the mysteries of a daily paper.

The Machinery Exhibits.

Messrs. E. Hampson & Co., of Cortlandt street, New York, show their Eclipse Corliss engine, and are running one-half of Machinery Hall with it.

The John T. Noye Mfg. Company, Buffalo, show their Rice Automatic high speed engine. The 100 horse-power engine running one-half the machinery occupies a floor space of 6 feet in width, and 16 feet in length. If you do not look directly at its 200 revolutions per minute you would not become aware that it was in motion, for no sound of jar or steam reaches the ear so perfectly does it control itself. It is a finished piece of modern engine building, and is attracting well-merited attention from all who enter the building.

The Erie City Iron Works exhibit their Automatic high-speed engine. Among

gas engines the Otto and Baldwin are struggling for the supremacy. The latter is doing very effective work running the United States Company's dynamo, which furnishes light for the immediate vicinity. The Otto engine is in the same well-known form with a few new features. Users of small power are showing great interest in both these engines.

The manifold application of electricity in an almost unlimited number of ways is proved by what is shown here. The Electric Service Company, of Buffalo, have an exhibit of the Johnson Temperature Regulator. This combination of electricity and compressed air, described in *The Iron Age* some time ago, is automatic in operation, and secures an absolutely even degree of temperature wherever applied. It is now in successful operation in dwellings, office buildings, schools, libraries, &c., and proves its value daily during the trying winter weather of this latitude.

Another electrical device shown is the Electrical Accumulator, in the exhibit of the Electro-Dynamic Company, of Philadelphia. By the use of this simple invention electricity for lighting and power purposes may be stored up and held on tap, so to speak. In many factories and even in large central lighting plants these batteries have done good service. They may be charged during the day while the machinery is running, and in use at night for lighting when the power is shut off.

The Electric Power Controller Company, of 34 Dey street, New York, show an automatic device, by the use of which power pumps and all moving machinery can be controlled from a distance. The simple device is arranged to trip valves and levers, whereby machinery may be stopped in case of an accident by pushing the common electric button. The value of this invention will be appreciated by all mill owners, where many operatives are employed about the machinery, and where the liability to accident is great.

Messrs. Pratt & Letchworth, of Buffalo, exhibit a full line of saddlery and coach hardware, all of which has been taken directly from their stock. Their extensive works are located at Black Rock, from where they supply the market with buckles, trimmings, hames and carriage irons in all forms. A pair of hames, weighing 200 pounds, are shown, but no definite information could be obtained as to the kind of animal they were made for. The specimens of gray and malleable iron are very fine in finish, the latter showing a remarkable toughness, some specimens having been twisted and beaten into shapes that would be a test for lead. The brass, bronze, nickel and silver plating shown is beautiful. There are pieces of steel castings made by this firm varying in weight from half an ounce to 3462 pounds. Their capacity for heavy steel castings is 5 tons. All work shown is made in their own works, even the paper boxes in which some of the smaller pieces are packed.

The Buffalo Scale Company, of Buffalo, have a very creditable display of scales. Among the new things they show is a latch attachment, which obviates the weighing of the scoop on grocers' scales. Their oil scale is also a novelty. A cheese factory scale is shown, having seven beams. An immense can is placed on the platform, and as the milk is poured into this can the first beam weighs it, and so on until seven separate weighings have been made for as many different farmers. A suspension butchers' scale is shown, and also a scale for weighing and measuring the height of an ambitious lean man and the hopeful fat man. Their patent testing machine for iron tests the strength of 1 inch iron bars. It registers the elastic limit and breaking strain.

The Burdick bolt forging machine, made by Plumb, Burdick & Barnard, of Buffalo,

is a new bolt-heading machine, especially adapted to head square and hexagonal bolts, but equally suitable for special shapes. The machine will turn out from 2000 to 6000 bolts in ten hours, and prevent the bolt from being smaller under the head, where the clamps hold it in ordinary machines. The machines are quickly adjusted, require little power and can head bolts of any length.

H. W. Dopp & Son, Buffalo, show butcher and soap-makers' machinery.

In the exhibit of Gerhard Lang, of lager beer brewing fame, is the Goulding bottle washer. This little machine washes 60 dozen bottles an hour, or about as fast as a man can handle them. It looks as if the days of washing bottles with shot were past. Yawman & Erbe, of Rochester, are the makers of the machine.

The Niagara Stamping and Tool Company, of Buffalo, make a good exhibit of sheet-metal workers' tools, including presses, shears, &c.

The Dodge Mfg. Company, of Mishawaka, Ind., show a large assortment of sectional wooden pulleys, both for belt and friction. Much of the machinery is run by them.

Wurtz & Schmahel show their malleable iron frame elevator buckets.

David Bell, of Buffalo, a pioneer iron boat builder in that section, shows numerous models of boats built by him, and three steam hammers of novel build.

The Star Machine Company exhibit their blowers.

John E. Smith & Co., of Buffalo, show meat chopping machinery of an improved pattern.

Maischloss Bros. make a fine display of files and their file cutting machines.

Felthousen & Sherwood show injectors, ejectors and engineers' supplies.

The Cutler Mfg. Company, of Rochester, show their mailing system for large buildings, whereby letters in the upper stories of our large office buildings can be mailed with as much ease and certainty as on the ground floor.

L. & I. J. White, of Buffalo, exhibit a full line of edge tools and machine knives. Their assortment includes tools for coopers, carpenters, butchers, &c., as well as for molding and planing machinery.

The Buffalo Lock Mfg. Company show a large line of locks, hinges and door fittings.

The Buffalo Belting Works have in use on the two 100 horse-power engines their belts as well as on the engines running the dynamos of the Brush and Thompson-Houston companies. These belts are made practically endless and so secure a good bearing surface at all points when in contact with wheel. They are made in any width up to 30 inches and can be made larger if required. The company also make washers from strips of leather at the rate of 60,000 per day.

Hodge, Howell & Co., of Buffalo, exhibit their Cockle machine, which is much liked by millers throughout the country. Frank & Co., Buffalo, exhibit wood-working machinery. The most marked piece is a combination hand and jig saw.

Bradley & Co., of Syracuse, show some fine cushioned trip hammers. They are fine specimens of mechanical skill.

The Springfield Glue and Emery Wheel Company show a full line of their grinding machinery, including their automatic knife grinder.

The Shepherd Hardware Company, of Buffalo, show their lightning ice-cream freezer Queen City, fruit and wine presses, toy bank and a large assortment of builders' hardware.

Messrs. John C. Jewitt & Co., exhibit their refrigerators, water coolers and a large line of metal goods in plain brass and plated. All show a high appreciation of what is novel and artistic in coal-hods, bird-cages, teapots, cuspadores, &c.

Danforth & Clark show a fine line of gas appliances in ranges, water heaters, &c. Their line of steam and hot-water heating apparatus is also well represented.

The bicycle exhibit is very large, possibly owing to the races in connection with the fair.

Mr. Read & Son, of Boston, show their specialty, the New Mail. Mr. Will S. Atwell has the exhibit in charge. The special features they call attention to are the Trigwell ball head and the Warwick perfection backbone and rim, all of which have now a well-deserved reputation among wheelmen.

The Overman Wheel Company are the makers of the Victor bicycle; they call attention to their Safety with latest improvements. Owing to the small diameter of wheels the vibration is great. To overcome this they have introduced a spring

to the needs of the day. The entire cycle exhibit is fine, showing, at a glance, a high order of mechanical perfection and taste.

Hodge, Howell & Co., exhibit their Unrivaled elevator head and boot, and combined head and hanger.

The Buffalo Belting Works, in addition to their patent web belting used on nearly all the running machinery, have a fine exhibit of leather belting. The graphophone also is exhibited and attracts a large number of visitors.

The Buffalo Express has an immense establishment in full operation, showing every detail of newspaper work, from editing to selling a paper, including telegraphic reports. They print the *Lightning Express* on a Scott perfection press. This is more than enterprising, and may prove to be the establishment of a new evening paper in Buffalo.

FEED WATER HEATER, MADE BY MESSRS. WARREN WEBSTER & CO., PHILADELPHIA, PA.

fork which absorbs the vibration, and, so to speak, carries with it its own good road. One foreign manufacture of bicycles has an exhibit here in the Club of the Coventry Machinists Company, of Coventry, England.

The Springfield Roadster is also to be seen. This machine is known as one possessing good qualities as a hill climber and coaster. The use of the lever in place of the crank makes long distance riding a pleasure.

Messrs. W. B. Everett & Co., of Boston, show the Singer cycles in all patterns.

The most extensive and varied exhibit is that of the Pope Mfg. Company, of Boston, which includes bicycles, tricycles, &c., too numerous to mention. Among the curiosities is a bicycle made by a Pennsylvania boy, and used to ride hundreds of miles. The wheels are made of solid wood with a flat hoop iron tire. It is quite a clumsy affair, though it appears to have done good service. Next in interest is the oldest bicycle in existence. It shows by contrast what a vast improvement has been made in the adaptation of the bicycle

Mr. Charles M. Morse, superintendent of machinery, has worked night and day to get the machinery hall in running shape, and to his efforts are due the promptness with which every piece of machinery started at 10 a.m., September 4.

The preparations for building the armored cruiser Maine at the New York Navy Yard are well advanced, and work will be begun as soon as a good supply of material is delivered. The Maine is the heaviest of the vessels yet authorized for the new navy, and differs from the earlier cruisers, like the Atlanta, the Boston, the Charleston and the Baltimore, in carrying heavy armor.

On Thursday, the 6th inst., the Pittsburgh and Lake Erie Railroad made a reduction in the rates on iron and steel billets and blooms, in carloads of 24,000 pounds or over, from Pittsburgh, Chartiers, Phillipsburg, Beaver, Fallston and Beaver Falls to Cleveland, Ohio, to \$1.25 per gross ton.

The Webster Feed Water Heater and Purifier.

What is known as the Vacuum feed water heater and purifier is being put on the market by Messrs. Warren Webster & Co., 491 North Third street, Philadelphia, Pa. The engraving which we annex explains its construction and operation.

The apparatus consists of a casing comprising an outer vessel or shell, in which are located a vaporizing or purifying chamber, a condensing chamber, a sediment chamber or receptacle, a delivery-pipe communicating with the vaporizing or purifying chamber and condensing chamber, water, steam, air and over-flow pipes, as shown in cut. The sediment chamber is provided with discharge-pipes and with suitable stop-cock and check-valve. The purifying chamber is supplied with steam through a pipe communicating with the exhaust of the engine or other steam supply and is also provided with an overflow-pipe leading to the drain-pipe of the sediment chamber.

The pump connection represents the delivery-pipe, which leads from the condensing chamber to the pump. The purifying chamber is formed by means of the front partitions extending entirely across the chamber and down into the sediment well. In this chamber are located a series of perforated trays or plates, and the highest plates communicates with the distributing device. In the sediment chamber are arranged a series of inclined plates; these plates are inclined in order to insure a perfect precipitation of sediment, and also to prevent any agitation of the same. The cold water inlet-pipe is for supplying water to the "purifier" and is provided with a cock or valve, and this pipe enters the condensing chamber at the top of the casing and supplies the water through the pipes in the condensing chamber to the distributing device. Above the purifying chamber and below the pipes in the condensing chamber are arranged a series of plates or steps, forming an inclined passage to allow vapors to pass freely from the vaporizing chamber, but to prevent the condensed vapors from returning into the former. An air outlet is provided, by means of which the air, liberated from the water, is withdrawn and prevented from accumulating in the condensing chamber. A branch pipe leads from the discharge-pipe and a water gauge communicates with the latter, showing the amount of water in the purifying chamber. All the inside parts are readily accessible.

It will be understood that action of the apparatus consists in converting the water to be purified into vapors, and re-converting the vapors back into a liquid state by the water next entering to be purified. The water is supplied to the purifying chamber, in which it is subjected to the action of heat, which removes the impurities from the water and causing them to fall into the sediment well, the heated vapors rising, enter the condensing chamber, and the moment they come in contact with the condensing surface the heat in the vapors is extracted and imparted to the entering volume of water before it enters the vaporizing chamber, and the vapors then drop in the form of liquid.

The grease and light impurities are prevented from passing out with the pure water by the partition wall extending below the level of the delivery-pipe, which entirely prevents them from entering the pump. The discharge or grease and scum-pipe leads from the bottom of the inclined plate nearest the delivery-pipe and is especially adapted for removing grease or scum which may accumulate by simply opening the cock. In case too great an amount of water should accumulate in the purifying chamber it will pass out through the overflow-pipe to the discharge-pipe.

Captain Jones on American Bridge Steel.

As the *Ironmonger* puts it, the "cat was let out of the bag" by Captain W. R. Jones, of the Edgar Thomson and Homestead Steel Works, at the meeting of the Iron and Steel Institute. Mr. Jones is reported by our contemporary to have said:

A word in regard to the steel used in the United States. Their boiler-makers and their bridge constructors lacked one point in their starting out. He said: "Give your chemical specifications; start out with a decided chemical composition in your steel, then all persons who bid on the steel bid on equal terms." Where the physical properties were alone specified, each maker (and there were a great many of them in America) would put in the cheapest kind of steel that would possibly reach that specification. The general result was that steel largely entered into the construction of bridges in the United States that had no business to be there. For the boilers alone of the Edgar Thomson Steel Works, their specifications were far more rigid than that of the United States Government for boilers for their cruisers. The Edgar Thomson specifications limited the phosphorus to 0.035, and the manganese to 0.035. When those specifications were first given out, the steel-makers refused to conform to them, but he insisted, and that was the character of the work. He specified that no holes were to be punched, and that the drift was to be absolutely kept away from the work, and he sent an inspector to have it carried out. With regard to the bridge material, he knew of his own personal knowledge that there had not been the proper care taken in the manufacture of steel. He had seen steel made for bridge structures; the heat was blown very rapidly—in probably eight minutes—the ferromanganese was put in cold, and he did not think the reaction had taken place yet in that steel. (Laughter.) On assuming general charge of the Homestead Steel Works, where they had succeeded by a different practice in not making good steel, he radically changed that, and he thought that Mr. Clark would testify that the steel he received from the Homestead Steel Works in the year 1888 was certainly of a very high class. A large series of tests were made, showing that the steel was homogeneous, and was remarkable in its even results; he was sorry he had not got the results with him. He fully coincided in everything the president had said, and the meeting would notice that the heartiest applause came from that side of the house in which he sat. He would now say, in conclusion, as he had said to Mr. Clark before, at such another assembled body of wise men, that he held as a cardinal principle—and again he would say that if he had this great dictatorial power he would enforce it, and it should be enforced by law—that no member of a bridge construction should have an excess of 0.65 in phosphorus. That was the uttermost limit that he would allow. He was opposed to the excess. He would keep the manganese as low as possible, as it is a great oxidizing agent, particularly in boilers. They could readily keep under $\frac{1}{2}$ per cent. of manganese. To start with, however, the chemical properties must be specified; then all contractors bidding on this bridge steel would enter the race on even "terms." He wanted first to have the chemical composition of the steel correct; then the physical tests could follow. (Applause.)

How correct this version of the remarks of Captain Jones is we are not in a position to state. The *Ironmonger* is very enterprising in giving an early report, but at times its zeal is evidently greater than its discretion. During the same meeting it attributed to M. Gautier the following choice bit, a part of the discussion on Mr. Hadfield's paper: "They employed a very soft kind of steel, because as the head of the nail was covered by the hole, they were sure that the wear and tear of this steel was not higher than it was in the steel."

While it is possible that Mr. Jones may not have been well understood by a reporter evidently without technical training, the conclusions drawn editorially from his remarks, in a later issue of the *Ironmonger*, may prove entertaining. We quote in full:

Bessemer steel manufacturers in this country have long been astonished and puzzled by the extraordinary output of the Bessemer works of the United States. Not merely in respect of the number of blows, but also as regards the tonnage per week or month, the American mak-

ers of Bessemer steel appear to be far ahead of us—so far, indeed, that our manufacturers are very curious, not to say anxious, to know "how it is done." In Great Britain the practice pursued in producing Bessemer steel is fairly uniform, and it is generally conceded that considerable expedition characterizes the work from beginning to end. Yet, with all our skill and knowledge, we are admittedly behind the American makers to a very marked extent. They seem to get more steel in a week out of 7-ton converters than we do from 10-ton converters. A remark made at last week's meeting of the Iron and Steel Institute by Captain Jones, of the Edgar Thomson Steel Works, may, perhaps, aid in elucidating the mystery. Captain Jones said that proper care had not been taken in the manufacture of certain American steel for bridges, and he "let the cat out of the bag" by stating that the "blow" was probably performed in not more than eight minutes, and the ferromanganese put in cold. If that period represents anything like the general length of time given to the "blow" in the United States, we need wonder no longer that so many heats per shift are got out in the Besse-

Wells' Rustless Iron.

The Wells Rustless Iron Company, 21 Cliff street, New York, had for some time previous to this year been manufacturing protected ironware under the Bower-Barff patents. A year or more ago, however, they began experimenting with a new process, the invention of Mr. W. T. Wells, the president of the company, and since the first of the year they have been using the Wells process exclusively. Iron protected by magnetic oxide has become such a popular article in many lines of trade that a description of this new process will be of interest to our readers. We will describe at first the process and follow with a description of the furnace used. The charge of iron or steel articles to the amount of some 12,000 pounds weight is placed in an ordinary muffle or heating

Figs. 1 and 2.—Vertical Longitudinal Sections of Furnace.

WELLS' RUSTLESS IRON.

mer works there. A shortening of the blowing time by from 80 to 100 per cent. must mean a good deal in a week's work, and the fact goes a long way in helping us to understand the enormous outputs of the American works. It is an entirely different question as to whether the steel thus produced is what it ought to be. If Captain Jones is correctly informed—and so able a gentleman certainly is in a position to know whereof he speaks—it is obvious that a good deal of the American Bessemer material must be of very poor quality. The very short blow is likely to render that result moderately certain, but to put in the ferromanganese cold is quite sufficient to make the product anything but steel. In saying this we do not seek to attach general discredit to American Bessemer steel, but desire simply to show that where really good and well-made steel is to be turned out it is not possible to make it in substantially less time or in much larger quantities than is done by our own works. This is true of ordinary rail steel, and is necessarily even more emphatic in relation to steel containing specified percentages of carbon for purposes other than rail making.

It is stated that the French cruiser *Alger* is to have triple-expansion engines worked at 240 pounds per square inch, furnished by Belleville boilers.

chamber and there gradually heated during a period of some 12 hours. It is important not to heat any part of the charge so as to blister it, and yet every part must be raised to the dull-red heat required by the process. The inventor prefers to use the gas made by the well-known Siemens' Producer in heating the charge and to admit air in limited quantities into the chamber along with the gas coming from the producers just enough to consume the latter and give a small flame in the chamber. During this operation the dampers are opened, permitting the escape of the products of combustion into the chimney. The heating must be gradual so that the charge will be raised in temperature evenly and equally and all blistering avoided. The increase of temperature should be so regulated that the maximum of heat is reached at the end of about 12 hours, though if a smaller charge than the one mentioned is used a shorter period will suffice. The surface of the charge by this gradual heating is apt to become somewhat oxidized both to red and black oxide, but the effect is irregular

and patchy where it does appear at all, and is not of any general importance in the result. The next and final step in the process is to turn on a mixture of steam and carbonic oxide gas when the chimney damper is closed. In this atmosphere of steam and carbonic oxide the charge is left for some five hours, more or less. The heat of the charge at the beginning of the operation is a dull-red and air should be excluded as far as possible. The steam, it is said, need be under little or no pressure, and may or may not be super-heated before introducing into the

feet high, 25 feet long and 6 feet wide. Figs. 3 and 4 are horizontal sections of the furnace, while Figs. 5 and 6 are transverse vertical sections. The section in Fig. 1 is made on the line *ff* (Fig. 3), and on the line *ee* (Fig. 5). Fig. 2 is a section on the line *gg* (Fig. 5). Fig. 3 is a section on the line *hh* (Fig. 1) and on the line *aa* (Fig. 2). Fig. 5 is a section on the line *dd* of Fig. 6. Fig. 6 is a section on the line *cc* (Fig. 2). Referring now to the special parts of the furnace *V* is the gas valve; *A* (Fig. 2) is an air valve; *G* is a gas flue; *H* is a steam valve; *C* combustion chamber;

pose of combustion by opening the valve at *A*, Fig. 2, during which operation the damper *D*, Fig. 1, is opened, permitting the escape of the products of combustion to the chimney. The gas, entering through *V*, mingles with the air passing through *A* at the extremity of the curtain, and is further mixed with the air by the checker-work *P* in the combustion chamber. The burning gas, passing through *O*, enters the port chamber *I* (Figs. 3, 5, 6), from which it passes up through the portholes *h* around, through and over the charge in *T*, and thence through the portholes *h* into the escape flue *E*, to the chimney flue *F*. When the charge has been heated to a dull red, the valve *A*, Fig. 2, is closed and steam is admitted through the valve *H*, the damper *D* being closed. For five hours the charge is submitted to the action of the mingled steam and carbonic oxide gas, the air being excluded as far as possible. The magnetic oxide produced by this process is described as very hard and comparatively elastic. It stands frictional wear well, but is apt to be injured by hammer blows or rough usage. Wherever the coating is removed rust will form, but it will not burrow under and raise the adjacent coating. The works of the Wells Rustless Iron Company are situated at Little Ferry, N. J., but a short distance from Jersey City, where there are furnaces for treating all kinds of iron and steel. They describe their process as especially adapted to wrought iron pipe for water conveyance, grate frames and fenders, architectural ironwork, ship work, gas, culinary utensils, cast-iron soil pipes and plumbers' castings, &c.

Figs. 3 and 4.—Horizontal Sections of Furnace.

Figs. 5 and 6.—Transverse Vertical Sections of Furnace.

WELLS' RUSTLESS IRON.

chamber. This final step of the process is the essential one, in which is produced the desired result of black or magnetic oxide. We will now describe, with the aid of sectional views, the furnace employed, which is an ordinary muffle or heating chamber of the usual construction. It does not require any special appliances to make it absolutely air or steam tight, or capable of standing high pressure, as the Wells process, it is said, does not require such elaborate or costly apparatus. The inventor does not limit himself to the employment of any particular kind of apparatus, but following is a description of what he considers the best means for carrying out his process. Referring to the engravings, Figs. 1 and 2 are vertical longitudinal sections of the furnace, which is built of masonry, in the ordinary way, about 5

feet high, 25 feet long and 6 feet wide. *O* (Fig. 2) an opening into the port chamber *I* (Fig. 6); *h h h* (Figs. 1, 4, 5 and 6) port holes; *T* is the main heating chamber; with an escape at *E* (Fig. 3); *D* is a chimney damper (Fig. 1) and *F* in the same figure is the chimney flue; *P* (Fig. 2) is a checker work in the combustion chamber; *s s s* are sight holes in the back of heating chamber; *l l* are curtains of masonry. When the articles are to be treated for the production of a rustless oxide on their surface they are placed in the heating chamber *T*, by being drawn in upon a drag through the door *B* (Fig. 2). The charge is gradually heated up through a period of, say, 10 to 12 hours, according to the size, by means of gas from a Siemens producer, admitted through the flue *G* by opening the valve *V*. A small quantity of air is also admitted for the pur-

Wire Bound Wood Hand Wheel.

For manipulating steam valves on radiators and cylinder lubricators a non-conducting wheel is required, and, as these wheels are usually made of wood, they are very easily split and broken off by heat or from a slight blow, thus making it difficult to open or close the valves, and the latter are a constant source of trouble. To prevent this trouble and to make the wheels more durable Mr. F. Lunkenheimer, proprietor of the Cincin-

Wire Bound Wood Hand Wheel.

nati Brass Works, Cincinnati, Ohio, has brought out a simple and efficient binder, the nature of which will be readily understood from the annexed cut. The wheels are circumferentially grooved and a wire bidder is inserted, the ends of which are twisted and sunk in a pit, as shown at *A*. The wire, as well as the groove, may be covered with a suitable cement of the same color as the handle and thereby made invisible. The binding of handles in this way is not expensive, and, as cheaper woods can be used in handles thus bound, the extra expense is very little.

The Massick & Crooks Hot-Blast Stove.

Among the hot-blast stoves which are widely used abroad but until lately little known in this country is the Massick & Crooks which is now being introduced by McClure & Schuler, of Pittsburgh. Up to August, 1886, 60 of these stoves had been built in England and Scotland, the following works being equipped with them: Askan, 15; Blaine, 4; Seaton-Carew, 8; Carlton, 1; Millom, 8; Parton, 1; Airdeer, 6; Glengarnock, 9, and Workington, 8. In this country the first were built about ten months since for Schoenberger, Speer & Co., of Pittsburgh, and lately contracts have been closed for three stoves 16 feet 6 inches by 60 feet for the Williamson Iron Company at Birmingham, Ala., three stoves, 18 feet by 65 feet, for one of the Milwaukee furnaces of the North Chicago Rolling Mill Company, and three for the Brier Hill Iron and Coal Company, of Youngstown.

The accompanying engraving shows the construction of the stove. The shell is a wrought-iron cylinder with a cone-shaped roof. At the apex of the roof is placed a chimney to carry off the gases while the stove is being heated, thus obviating the necessity of having an underground chimney flue, and large and expensive draft chimney which occupies valuable space. The stove has a central combustion, outside of which are large segmental shaped flues which lead the gases down and into the outside flues. The latter are smaller, segmental in shape, the gases passing through them and out through the chimney. The walls are all heavy and the passes large, thus avoiding the drawback of securing a large amount of heating surface at the expense of thin walls. McClure & Schuler state that in their experience that a stove having thick walls when thoroughly heated up will retain the heat longer. This was demonstrated a short time ago. Shoenberger, Speer & Co. had a break out at the hearth of their furnace. They had the blast off the furnace for eight hours. When work was resumed they had 1200° of heat to start with. By having a central combustion chamber circular in form the greatest heat is in the center, thus equalizing the expansion. This chamber can be entirely removed and replaced without disturbing any part of the brickwork, and there are no straight or parallel walls to get out of shape from heat expansion and contraction. Where the cold blast is introduced into the stove it blows against the underside of the chimney valve, thus automatically closing it. The wind breaking its force on the valve before coming in contact with any part of the brickwork. This is considered very important by the designers, as they find the introduction of the blast in another manner cuts out the joints, weakening the walls.

For cleaning, a series of plug holes with tight-fitting caps are provided, as shown in the plan. Through these holes a small coil chain is passed to the bottom of flue; a spring scraper that neatly fits the flue is attached and the chain is wound up by a portable crane shown on elevation. An arrangement is also provided by which the flues can be blown out as desired. The stove flues being divided into six compartments, a cleaning door is used to get access into the bottom of stove. On these doors there is a fly-back relief-door, which is suddenly opened when the pressure is on the stove, causing a rapid flow of the blast toward the flues whose relief-door is open. By this means the flues are to a great extent cleaned. These doors are opened alternately when changing from blast to gas. In the case of the stoves erected at the furnace of Schoenberger, Speer & Co.,

in Pittsburgh, about ten months ago, the only cleaning ever done since starting was to remove the accumulation of dust at the bottom of the stove and that was done only once.

Schoenberger, Speer & Co. report that after eight months' use the stoves gave 1400° to 1600° of blast temperature as readily as when they were first used, and that during that time they have not noticed any weakness in any part. The following is a copy of the record of the casts, running on Bessemer metal, from August 2d to 10th:

Cast No.	Silicon.	Sulphur.
1021.....	2.32	0.002
1022.....	2.30	0.004
1023.....	2.85	0.006

The consumption of fuel to the ton of iron during that time is reported by Schoenberger, Speer & Co. to have been 2018 pounds of coke.

Pittsburgh Nail Manufacturers.—Announcement is made that Shoenberger & Co., formerly one of the largest nail-making concerns of Pittsburgh, have decided to abandon that industry and will shortly dispose of their nail machines, 92 in number. The principal reason advanced for this step is that after the usual summer stoppage for repairs and operations were about to be resumed the nailers in the employ of the firm demanded a considerable advance on the regular scale for cutting chisel-pointed nails, the manufacture of which is a specialty of the firm. This demand was refused and the nail factory has been closed down. The retirement of this firm from the nail business leaves but two concerns in Pittsburgh engaged in the manufacturing of nails. These are Jones & Laughlins, Limited, and Chess, Cook & Co., with 63 and 96 nail machines respectively. Less than five years ago there were nearly as many nails made in Pittsburgh as in Wheeling, while to-day it is probable that the smallest concern in Wheeling is making more nails than are manufactured by the two remaining works in Pittsburgh. The principal reason of this great change here is the fact that the Pittsburgh nail manufacturers have been compelled for years to pay more for nail cutting than is paid in either Wheeling or at any of the factories located in Ohio. It is a well-known fact that for months past the Wheeling manufacturers have been selling nails in Pittsburgh for less money than the Pittsburgh manufacturers can make them. For this reason the manufacturers at Pittsburgh have gradually given up the manufacture of nails, and, unless a wonderful revival in the trade should take place, the manufacture of nails at that city will soon be a thing of the past.

The Iron and Steel Institute.

Edinburgh Meeting.

The first paper read before the Iron and Steel Institute at the Edinburgh meeting, by Daniel Adamson, on a compound lever-testing machine of 15,000 powers, is not of sufficient interest to call for reproduction, especially since the accompanying drawings have not yet been published. The second contribution to the proceedings of the meeting, by R. A. Hadfield, of Sheffield, is likely to attract more general attention, since it gives additional data on

Manganese Steel.

This new steel has drawbacks that at present interfere with its usefulness and commercial introduction. The chief one met with is its hardness. The majority of articles used in machine construction of any kind must be tooled, fitted or adjusted to shape, and this is almost out of the question with this material—in fact, in its machining it may be described as equal to the hardness of chilled iron. No doubt, by experiments and perseverance, this and other difficulties will be overcome, and possibly this very drawback may eventually prove a blessing in disguise, inasmuch as should some better method of machining or finishing be perfected, it should be equally beneficial to all branches of engineering.

A series of experiments was commenced at the Hecla works, Sheffield, some few years ago, it being thought possible that steel with high manganese might give a hard material, somewhat like spiegel-eisen, but without the brittleness of the latter, seeing that the carbon should be so much reduced. After many trials a material was produced combining great strength with hardness, but the puzzling and apparently paradoxical result was discovered that, although steel, if it may be so termed, with 4 to 6 per cent. of manganese, and less than $\frac{1}{4}$ per cent. of carbon, was so brittle that it could be powdered under a hand-hammer, yet, by adding twice this amount of manganese, just the contrary effect was produced, and a material was obtained containing many apparently new properties, as compared with any iron or steel hitherto manufactured. Briefly, the material may be described as follows: That containing from $2\frac{1}{4}$ to 6 per cent. is extremely brittle in its cast state; then a return in strength gradually takes place, and, with about 9 to 10 per cent., a cast bar, $2\frac{1}{4}$ inches square, can be bent considerably out of the straight without breaking. This continues up to about 14 or 15 per cent., when a decrease occurs in actual toughness, though not in transverse strength, and after about 20 per cent. is passed, then a rapid decrease again takes place. It should be stated that these remarks apply specially to the material in its cast state.

Possibly, if ferromanganese were made with less carbon, or if pure metallic manganese could be obtained, the maximum of strength might occur with even higher manganese; but now, as the higher percentages are approached—say over 16 per cent.—the experiments become more complicated, owing to the presence of $1\frac{1}{2}$ to 2 per cent. of carbon, which must necessarily interfere with the action of the manganese. It would be interesting to note the effect of adding metallic manganese—i.e., without any carbon, but, after many attempts, the writer has been unable to obtain such a metal. Samples supplied as pure manganese were generally found to contain not more than about 90 per cent.—in fact, it seems doubtful whether the exact characteristics of the metal are really known, and probably the samples under examination, and supposed to be pure,

have been mixed with impurities. Manganese steel is not so liable to honeycombs as ordinary steel, and the addition of silicon is unnecessary. It is very fluid, and can be run into thin sections, but cools more rapidly than ordinary steel, and its contraction is decidedly greater. This latter fact explains the reason of its piping and settling so much, both in the ingots and in castings; with proper heads or runners, however, this difficulty can be obviated. It is manufactured by any of the ordinary steel-making processes, the basis—i.e., the material before the ferromanganese is added, being preferably decarbonized iron (practically pure iron, Fe), or mild steel. The ferromanganese is added in a molten state, or very highly heated. The steel is then ready for casting into ingots or other forms. It is most important that the carbon should be kept as low as possible, especially in the 14 per cent. material, where it should not exceed about 1 per cent. or the product will be inferior. For this reason the ferromanganese used should contain high percentages of manganese, such as 80 to 84 per cent., now easily procurable at as low a price as 9 shillings per ton. About 0.50 per cent. of the manganese is oxidized—that is to say, to obtain a steel with about 13 per cent., about $13\frac{1}{2}$ per cent. of manganese must be added. In other words, the following mixture gives the above analysis:

	Pounds.
Ferromanganese, 80 per cent.....	375
Very mild steel or decarbonized iron...	1,865
Total.....	2,240

This would give a ton of 13 per cent. manganese steel.

MANGANESE STEEL, $7\frac{1}{2}$ PER CENT. AND UPWARD.

A. Cast State.—After passing about 7 per cent. an increase in strength occurs, and with about 10 per cent. a $2\frac{1}{4}$ inch square bar will bend considerably before breaking, although with a comparatively low transverse strength, the latter rapidly rising as the manganese increases, but the samples with higher manganese and higher transverse strength are not so tough as this 10 to 14 per cent. material. Speaking of these latter percentages, it has been found from the commencement of the experiments with this material that, notwithstanding its toughness as ordinarily cast, an extraordinary gain in strength is obtained by methods which, in ordinary steel, would cause brittleness, water cracking and other defects. This process is termed "water-toughening," and consists in heating the article under treatment to about 1800° or 2000° F., and then plunging it into cold water. The nearer the above temperatures are approached, and the colder the water, the tougher will be the material. The writer is at present unable to say whether this treatment would be found applicable, and in the same degree beneficial, with articles of large size, but he believes that with proper apparatus and methods of cooling, such as the rapid introduction of cold water into the bath to keep down the temperature, similar benefits would result. As, however, the difficulty of tooling and machining this material has not been overcome this point has not been experimented upon. The beneficial action of the water-toughening process will be seen from the actual results and tests obtained with the different articles described in this paper. It will also be seen that this toughening applies equally to material in its cast and in its forged state, and in both cases the increase in strength may, without exaggeration, be termed most remarkable.

Take, for example, small pieces of this material in its cast state, 12 inches long, $1\frac{1}{4}$ inches wide, and $\frac{3}{4}$ inch thick. After water-toughening, notwithstanding their hardness and stiffness, such strips can be bent double cold, almost in the same way

as a piece of the mildest forged steel, the apparently contradictory qualities of hardness and toughness being here obtained. This material has been tested and found well adapted, owing to its combined hardness and toughness, for couplers as used in coupling railway rolling stock in America, where nearly all cars or wagons have a coupler, drawbar, and buffer combined in one. The writer's firm has now the sole license out of America for making the well-known Janney coupler, so largely used on leading railroads in America, and introduced into this country by Mr. A. Davis, C.E., of Westminster. The couplers tested weighed 125 pounds each, and in no place excepting at the jaws are the castings more than $\frac{1}{2}$ inch thick.

The tests were made with an ordinary drop tup, weighing 2324 pounds, sliding between steel rails, and the height could be varied from 1 to 27 feet. Each casting was placed vertically, the tup falling upon the jaws, and the permanent set being carefully measured after each blow. All the couplers except No. 1 were made at the Hadfield Steel Foundry Company's works.

No. 1. American malleable iron casting.

No. 2. Manganese steel casting (Mn., 9.37 per cent.), tested just as cast.

No. 3. Mild steel casting (carbon, 0.25 per cent.). The material of which this coupler was cast had a tensile strength of 32 tons per square inch, with an elongation of 30 per cent. on 2 inches.

Nos. 4 and 5. Water-toughened manganese steel castings with 9.75 and 14.25 per cent. Mn., respectively.

Table I gives a summary of the tests and effects produced by the total forces ex-

iron and steel, has experimented with this material and found that it bent while blue hot from 21 (lowest) up to 36 (highest) times, as against 3 to 5 for Low Moor iron, and $2\frac{1}{2}$ to 7 for very mild Siemens steel. At a blue heat, therefore, it seemed to work better than iron. The Chatillon Company, in France, are experimenting with this material in the direction of using it for armor plates and other purposes. Another noteworthy test has been made with a cast flanged pipe No. 671 (Mn., 13.5 per cent.). Notwithstanding the thinness of the walls ($\frac{3}{8}$ inch), it safely bore a pressure of 5600 pounds per square inch and did not burst until 6160 pounds had been applied.

All the foregoing examples were water-toughened specimens. Other specimens, tested in their ordinary cast state, may be mentioned, such as a cast axe which has chopped through square (cold) iron, and cast razors, which, while not equal to those of ordinary steel, have done fairly well. Still, owing to the peculiar softness noticed with this material when under compression, it is hardly suitable for tools carrying a thin cutting edge. In grinding up a manganese steel axe, Mr. C. W. Hubbard, of Pittsburgh, noticed that the material possessed a close, hard and peculiarly greasy nature, and he considered that it possessed the very essence of anti-friction. A bearing was put to work at the Hecla foundry, under a shaft $2\frac{1}{2}$ inches in diameter, carrying a load of 3 cwt., and after having been at work $2\frac{1}{2}$ years it is but slightly worn. It is estimated that the number of revolutions made by the shaft has been close upon 5,000,000. As indicating its toughness, and showing how even practical steel makers may be de-

and one which led to the commencement of these experiments, is its application as a hard material for car and other wheels, to compete with those made of chilled iron in America and elsewhere. The difficulty was at once met with that if the wheel was cast in one piece, although exceedingly tough, it is hard to the tool throughout, and it is impracticable to bore out the boss. Attempts were made to cast, in the boss, soft steel or iron bushes, but this was generally unsuccessful owing to the contraction splitting the boss when cooling. A more successful method has been that of casting the wheel in two parts, then bolting or otherwise fastening them together; or that of casting in the hard tire wrought iron or soft steel arms, on to which an ordinary soft steel boss could be afterward bored, was cast. In either of these cases the tires are readily trued or ground up, as practiced in America. Wheels of this class have been used with satisfactory results. On the Nottingham tramways a set ran over 30,000 miles under severe conditions, the gradients averaging as much as 1 in 18 for about one-half the route of the daily journey. In this case a peculiar point was noticed—viz., that whereas the cast-iron wheels are liable to slip when going down an incline the chilled brake-blocks bite much more effectively on manganese wheels, enabling the car to be stopped sooner. The Chester Tramways Company has had a set running for over two years, which up till now have run over 45,000 miles, and are not yet worn out. Wheels of this description can be tested with more than 100 blows with a heavy sledge-hammer without fracture occurring, and at the same time the tire is so hard that a chisel will not touch it. A set put to work in America has already run 200,000 miles, under heavy engines of the consolidation type, on the New York and New England Railroad. The life of ordinary chilled iron wheels does not average more than 50,000 miles.

B. Forged State.—The original gives elaborate tables of tests and analyses and diagrams, too extensive for reproduction, but the following examples will suffice to show some of the results. A steel carrying 13.75 per cent. Mn., when water-toughened, possessed a tensile strength of 65 tons per square inch, with 50.7 per cent. elongation on 8 inches. Another specimen, with 14.27 per cent. Mn., gave 69 tons and 46 per cent. In the latter case, calculating the breaking-load on the area of the bar at the moment of fracture, the load was equal to the high amount of 102 tons per square inch. Another sample gave 65.61 tons with 48.4 per cent. elongation, and was still unbroken. As before pointed out, after passing about 14 per cent. the material again loses strength. This is no doubt owing to the higher amount of carbon necessarily present. Nevertheless, it has been possible to forge specimens with 20 and even 22 per cent. manganese and over 2 per cent. carbon. Thus, while an alloy of $97\frac{1}{2}$ per cent. of iron and $2\frac{1}{2}$ of carbon is practically unforgeable, an example is here met with where an alloy of 78 per cent. of iron, 2 per cent. of carbon and the rest of manganese is quite malleable. Ingots and castings containing 14 per cent. of manganese and weighing 28 to 30 cwt. have been successfully cast and forged; these may be termed fairly large pieces.

It has been thought by eminent metallurgical authorities, if this material was not a true alloy or steel, that in large masses the manganese would concentrate or separate toward the center, such as has been found to be the case in ordinary steel ingots. The above examples, however, prove that this is not so, as wire rods No. 8 B.W.G., drawn out of blooms made from ingots about 18 inches square, were found quite uniform in their percentage of manganese, as compared with the analysis

320.87	{ 0.65 " not broken }

erted on each casting. The effect of low temperature on these castings has been noted by Mr. Harrington, mechanical engineer of the Pittsburgh, Cincinnati and St. Louis Railroad. A light manganese knuckle, weighing about 50 pounds, belonging to a coupler head, was immersed for 30 hours in a freezing mixture of salt and ice. The casting was so cold that upon touching it the hand was "burnt." A drop tup was then allowed to fall upon it from a height of 25 feet, the only effect being a slight indentation in the casting. It may be also mentioned that the effect of higher temperature upon this steel has been noticed and that no change is observed until a temperature of about 400° F. is reached. For particulars of the foregoing temperature tests the writer is indebted to Mr. J. D. Weeks, of Pittsburgh, Pa., who has taken special interest as to this steel in America. As regards the effects of increasing temperature, Mr. Stroh-meyer, who has read an interesting paper upon a similar point as affecting ordinary

ceived in the appearance of its fractures, it may be stated that when the material was being tested at the Crescent Steel Works, Pittsburgh, the blacksmith to whom an ingot was given to break was inclined to be sarcastic as to the "scalded ingot" (Mn. 10.89 per cent.), as it was termed, and said that it would be easily broken with a sledge hammer. Not only was he unable to do this, but ten blows from the steam hammer were required to cause a fracture. A singular point about the fractured appearance of the 9 per cent. material may also be mentioned. When water-toughened, though the metal is greatly increased in strength, this is certainly not owing to structural changes, as the pronounced form of crystallization of the ingot or casting is not to the eye in any way altered. It will, therefore, be understood how difficult it is to offer any satisfactory explanation of the gain in strength by this treatment, which, in all ordinary steel, would be so detrimental. Another important use of this material,

of the original ingots, thus proving that this manganese steel is a true and stable compound or alloy. Care must be taken not to overheat the ingots, or they burst and crack under the hammer. With proper care, however, there is not much trouble beyond that the steel works hard, or similarly to tool steel containing, say, 1½ to 1¾ per cent. carbon. As in lower percentage, so in this, the peculiar crystallization noted entirely disappears after forging, and a close grained metal is obtained. The bars, as received from the forge, are comparatively brittle, but reheating to a yellow heat, and cooling in air, increases the ductility five or six times. It is, however, specially with the water-toughening process, as already mentioned, that the extraordinary toughness, which is the special characteristic of this steel, is noticed. Oil has a beneficial effect, but not equal to that of either water or sulphuric acid, this, no doubt, being owing to its slower conductivity. The operation of merely heating the forged test-bar to yellow heat and cooling it in air has a very beneficial effect, the elongation in most cases showing a considerable increase, and the tensile strength, also rising 8 or 10 tons per square inch. It is somewhat curious to notice the remarkable rise both in tenacity and elongation in the 14 per cent., as compared with the 10 per cent. material. Why should the extra 4 per cent. manganese cause such a remarkable difference? The writer thought that possibly this 14 per cent. material might owe its increased tensile strength to the higher carbon present, but an experiment proved that this was not so, as a 10½ per cent. sample, with similar carbon to the 14 per cent., gave no higher tensile strength and its elongation was decidedly less.

The following tests were made to compare the forged and water-toughened manganese steel, carrying Mn. 12.55 per cent., with the best quality of steel as used in railway axles. The tup was the same as that used for the coupler tests, the axle being reversed after each blow; bearings 3 feet apart; weight of tup, 20½ cwt. The bars were 4½ inches diameter and 4 feet 6 inches long. The results of these tests show that on the manganese steel bar or axle an energy of 498 foot-tons only produced total deflections of 39 inches (i. e., the sum of all the deflections), whereas in the special steel axle an energy of 48 foot-tons produced total deflections of 105½ inches.

Table II.—Comparison of Deflections Produced on each Axle.

Effect produced by the number of blows as under.	Energy developed in foot-tons.	Sum of permanent deflections or bends in inches produced on	
		No. 1 Special steel axle.	No. 2 Manganese steel axle.
At the 5th.	79.883	24.953	8.501
At the 10th.	208.531	66.188	19.403
At the 15th.	348.561	105.248	30.212
At the 20th.	497.988	and broken	39.491 and broken

The peculiarly combined toughness, hardness and stiffness of the forged manganese steel are very clearly brought out in these tests. The material, therefore, seems specially adapted to resist severe stress before fracture, and yet, at the same time, to show very slight alteration under stress.

Peculiar Hardness.—It is somewhat difficult to describe this quality, because all the specimens are exceedingly hard—in fact, it is scarcely possible to machine any of them on a practical scale. Yet such hardness varies considerably in degree, being most intense in the cast material containing 5 to 6 per cent. of manganese, which no tool will face or touch. A slight decrease then occurs, and the 10 per cent.

material gives comparatively the softest condition. Upon a further addition of manganese an increase again takes place, and at 22 per cent. it is very hard, though still not so much so as in the 5 per cent. material. An example may be given of the forged test-bar with (Mn. 14 per cent.) which elongated 44½ per cent. without fracture, and sustained a tensile load of 67 tons per square inch. This was put under a double-gear 18-inch drill, and more than an hour was occupied in drilling one hole ¼ inch diameter by ¾ inch deep. Even to do this, it was requisite to run at the slowest possible speed, or the edge of the drill would have given way. Yet this specimen could be indented by a hammer, so that, while so hard, it may be said to possess a special kind of softness. This softness, if it may be so termed, is noticeable when testing the material for compression. Specimens of 10 per cent. manganese steel, 1 inch long by 0.79 inch diameter, although requiring several days' preparation in the lathe, owing to their hardness, yet, under a compression load of 100 tons per square inch, shortened 0.25 inch, and the harder kind (15 to 20 per cent. Mn.) 0.1 to 0.13 inch. Ordinary mild steel would shorten 0.5 inch under the same load, but chilled iron or hardened steel would stand this test without any alteration. It is difficult to explain the cause of this peculiar hardness, because manganese, when added to copper, does not produce this remarkable change, and why, therefore, should manganese added to iron, which in its pure state is but little harder than copper, produce such a hard alloy?

MANGANESE STEEL IN FRANCE.

M. Gautier, in the discussion of the paper, referred to experiments being carried on at the Chatillon et Commeny works, in France, where castings up to 4 and 5 tons in weight have been made. They began with horseshoes, using steel with ½2 per cent. of manganese; but there was this difficulty. Nails were used with horseshoes, and it was necessary when they projected from the foot of the horse to cut or file them, but if they were made of the same material it was difficult to find a tool that would cut or file them. That led to the use of another kind of material for the nails. An experiment was now being made on a large scale with some cavalry regiments in France. Considerable success had also been obtained in making cast wheels for small mining cars. The difficulty was in drawing the pieces quickly enough from the mold and putting them in water to get the proper temperature. If they were not taken out quickly enough some shrinkage would take place. The most interesting application of the metal was, perhaps, in the direction of armor plating. That, of course, was a difficult matter, because artillery experiments could not be carried out on a reduced scale. Some difficulty also had been experienced from the manganese steel being too high in carbon, and some cracking had taken place in dipping the armor plates in water, but they hoped soon to be able to make a better quality of steel with a reduced amount of carbon. He had explained at a meeting of the Institution of Civil Engineers his views on the influence of carbon on general metallurgy. The cast steel was made with carbon. The Sheffield school, making first-class steel with carbon, might be said to represent the golden age of carbon; but new processes like the Bessemer and the Siemens-Martin had induced persons in enlarging the area of manufacture to try the influence of certain impurities. Carbon appeared to be a very bad companion, and as he had shown in a paper in 1876, phosphorus might remain in steel without much trouble if there was no carbon at all. The same fact had been observed with regard to silicon, and it was now also

observed with reference to manganese. The less carbon there was in manganese steel the better it would certainly be. But it was impossible to make manganese steel with, say, 12 per cent. of manganese without having a very high amount of carbon also. Some experiments were now being made with ferromanganese to reduce the percentage of carbon, and they would show whether such a result was practicable.

Louisville Fall Celebration.

The City of Louisville, Ky., was given up to the great Industrial Parade on the 5th inst. Business being entirely suspended, the street cars stopped and the thoroughfares, which were profusely decorated, were literally crowded with visitors and sightseers. The Fall Celebration was handsomely inaugurated, and for the rest of the month festivities and attractions of various kinds will be carried on. The railroads entering Louisville are aiding materially in crowding the city with strangers by giving reduced rates of fare. The parade was one hour and a half in passing a given point, and was headed by Gov. S. B. Buckner and staff and a committee of the Commercial Club. Following came the entire Louisville Fire Department, of which the city is justly proud. Among the attractive floats were displays by the following firms known to the readers of *The Iron Age*: B. T. Avery & Sons had four floats of plows and cultivators, all beautifully finished; on the top of one wagon was a mammoth 40-horse plow. The Southwestern Agricultural Works showed their grain drills, cider presses, corn shellers and feed cutters, and interspersed with the farm implements. Fulton, Conway & Co., showed the products of their hub and spoke factory, having a large wheel 16 feet in diameter, revolving among other wheels. W. B. Belknap & Co., made a very handsome display of their hardware specialties and tools. W. T. Pyne exhibited an engine and corn mill in operation. Stratton & Terstegge and the Bridgeford Company displayed stoves and ranges of all kinds. The Fischer Leaf Company had out enough mantels to furnish several houses. The lumber display was well managed. The Fall Celebration is due entirely to the efforts of the Commercial Club, an organization just one year old, composed of young men, and numbering 687 active members. The result of the Commercial Club has been the infusion of new life to general business and enterprises through the State, of the opening up the mineral and timber lands of Eastern Kentucky, and bringing to the city 45 new manufacturing enterprises, among them some very important ones, such as the Louisville Cotton Mills Company, the Astoria Vencer and Lumber Company, the Gaynor Electric Company, the S. Western Mfg. Company and a number of others.

Johnstown Freight Rates.—The Pennsylvania Railroad Company and the Baltimore and Ohio Railroad Company have restored the old rates on iron and steel from Johnstown, Uniontown, Mount Pleasant, Scottdale and Everson, which are about 10 per cent. higher than those from Pittsburgh to Western points. Some time ago the rates from these points were reduced to the same basis as those from Pittsburgh, but the opposition manifested by the manufacturers of that city was so great that in justice to them the railroad companies restored them. Under the tariff now in force the Pittsburgh manufacturers are not discriminated against in any way.

The Cleveland police authorities have decided to permit no more red flags in that city.

THE WEEK.

Joseph Pool is at the head of an English and American syndicate which proposes to build a railroad across Mexico from Gulf to Ocean, and claims to have obtained a subsidy from the Mexican Government for the purpose. The western terminus, it is declared, will be Tonala, on the Pacific, and the Eastern, San Juan Vautista, on the River Griyalva, about 100 miles from the Gulf. This river is very deep, and will receive vessels drawing 25 feet of water as far inland as the proposed railroad terminus. The length of the road would be 225 miles, and by this line the route to New York would be 800 miles shorter than by the Isthmus of Panama. The necessary capital, it is said, has been obtained, and President Diaz, of Mexico, is said to be actively interested in the scheme. This is the second transcontinental project recently set on foot in Mexico.

The United States Superintendent of Repairs in this city reports to the Supervising Architect of the Treasury Department approving the suggestion first put forth by the New York Produce Exchange that the property bounded by Bowling Green, Whitehall and State streets be bought as a site for the new Appraiser's stores and Custom House. He calculates that \$3,000,000 would be a fair valuation for the land thus taken.

The situation in the petroleum markets at this time is more interesting than it has been for several years. There are indications of a combination of big operators to put up the price of crude oil, and the movement of the market in the past few days is taken as evidence that the combine, if there is one, is not without its influence. The big shut-down movement of the Producers' Protective Association expires on the 1st of November, and by that time the stocks will have been reduced from 31,000,000 to 20,000,000 barrels. Besides reducing stocks the work of the Producers' Association has lowered the daily output of the wells from 72,000 barrels to 38,000. It is now proposed to pool the oil and sell it through a committee of trustees, who will also regulate production and restrict the drilling limits.

The transportation lines of steamers on the northern lakes, although reinforced by a large addition of tonnage from the shipyards during the early part of the year, report that the business offered to them during the season thus far is in excess of their capacity. Every freight line, it is said, could have used a larger fleet to advantage. The "liners" have not monopolized the lake trade, either. In August one agency at Chicago chartered "tramp" vessels to move over 2,000,000 bushels of grain, and six other agencies arranged for the carrying of about 8,000,000 bushels more. The shipyards are not likely to remain idle. Capt. James Davidson, the Bay City shipbuilder, says: "Whatever the close of the season may be there will be considerable building. The movement toward craft of immense size and high speed seems at an end, and prospective builders favor steamers of 2000 tons or 65,000 bushels capacity, and power to make 12 miles an hour. They seem to think that with the class of freight the lake marine has to carry a higher speed is not economical, and boats that can get around the harbors easily are the most satisfactory."

The third of a fleet of six steel steamships contracted to be built by the Globe Iron Shipyard, at Cleveland, was launched on the 4th inst., and will at once take her place in the Northern Line, between Buffalo and Duluth. She is called the Northern King. Two more steamers of

the same line are already on the blocks, and still another goes onto the blocks from which the King was launched. The Northern King is an exact duplicate of the two already finished, being 312 feet over all, 292 feet keel, 40 feet beam, and 24½ feet hold. Her power is also the same, a triple expansion engine, cylinders, 24, 38 and 61 inches, with a 42-inch stroke. Her estimated carrying capacity is 2800, and cost \$220,000. Her draft yesterday was 6 feet 7 inches aft and 3 feet 10 inches forward. The fleet is said to have no equal on the lakes.

The crush of baggage at the various railway stations in this city during the past week will be memorable, passing all experience subsequent to the great blizzard. A single train at the Grand Central Depot brought nine carloads of it. At several points the storage capacity was unequal to the demands, and a delay of three days in making a delivery was not unusual.

The greatness of the State of Ohio was a prominent topic in Governor Foraker's address at the opening of the centennial exhibition in Columbus last week. "During this century," he said, "the whole of the 26,000,000 acres of our area has been subjected to the uses of man; more than 17,000,000 of these acres have been put under actual cultivation, with the result of an annual yield of more than 100,000,000 bushels of corn and more than 40,000,000 bushels of wheat, with all other agricultural products which our climate admits in due proportion. We have 600 coal mines, that give us an output of more than 8,000,000 tons of coal annually. We have more than 7000 manufacturing establishments, almost as varied in character as are the wants and purposes of man, in which are invested a capital of more than \$200,000,000. In these establishments 250,000 men, women and children find remunerative employment, and from them we have products, fabrics and wares amounting annually to more than \$400,000,000, which go out into all the channels of trade and commerce, to literally gather from the ends of the earth rich rewards for the labor, skill and ingenuity of our mechanics and artisans, and add to the fame and name of a progressive and enterprising people. We have, in short, where there was nothing a century ago, a grand aggregate of nearly 4,000,000 of people and five thousand millions of wealth. We stand as a State in the front rank with the greatest States of the great American Union."

All the wooden culverts and short bridges on the Delaware, Lackawanna and Western Railroad are being replaced with substantial iron structures. There are but few of the original wooden bridges left.

The now venerable Dr. Joseph Francis, inventor of the metallic lifeboat and other life-saving appliances, is now 86 years old. A few days ago Congress awarded him a gold medal with a suitable inscription, to be presented by the President of the United States "in recognition of his eminent services." Emperor Napoleon, before whom he gave a special exhibition of his life-car, knighted him and gave him a gold snuff-box. The box was studded with 86 diamonds. The Emperor of Russia created him a knight of St. Stanislaus, and when he returned home he found that his life-car and pontoon wagons for naval and military purposes had been adopted by this Government.

New Orleans is expecting to become a great lumber port, now that railways give it a better connection with the Yazoo delta, of Mississippi, the future field of hardwood lumber production. It is the port also of the pine country along Lake Pontchartrain and the line of the Illinois Central, and of the great pine region lying

along both banks of the Red, and finally of the cypress forests of the Mississippi and Atchafalaya. It will thus be seen that all the leading varieties of lumber meet there, pine from half a dozen sections, cypress and the varied valuable woods of the Yazoo delta.

The Louisiana sugar crop of the last year was the largest since the war, and exceedingly lucrative. The production amounted to 285,000 hogsheds, an increase of 139,000 over the previous year, and the yield of molasses was nearly 22,000,000 gallons. The coming year promises a still larger increase.

Bernard Gallagher, a well-known local contractor, has been awarded the contract for completing the new Federal building in Brooklyn at his bid of \$860,000.

There are 4000 acres of mud flats in front of Jersey city and Bayonne which it is proposed to utilize by building a series of wet piers, with channels between them of sufficient depth for the passage of large vessels. A Legislative committee of the State of New Jersey regard this plan as feasible.

The heavy shipments of wheat from California to France are regarded as a sure indication that Europe will require much larger supplies from America than it did last year. Already this season the exports from San Francisco to France exceed by more than 50 per cent. those to Great Britain, whereas in the last harvest year to date France took no wheat from that port.

A syndicate of New Yorkers and Europeans, headed by H. B. Hollins & Co., represented by H. M. De Thysebaert, and Robert Colgate, represented by M. L. Guiraud, have signed a contract with the Mortgage Bank, of Mexico, whose charter was granted by the Mexican Government, in 1882, previous to that of the National Bank of Mexico. The principal condition of the agreement with the bank was the granting by the Government of certain modifications to the charter, so as to enable the bank to carry on a general banking business and issue certificates of deposit in silver and gold, in dollars, payable in the Republic or abroad. The combination has for its object the uniting of the silver production of Mexico with that of the United States, so as to make the silver market in New York instead of London. It is stated at Mexico that Mr. Jordan, of the Western National Bank, New York, is the moving spirit in the enterprise.

The Mallory line of steamships to Florida has been temporarily withdrawn because intermediate Southern ports are closed against infection from Jacksonville.

The official crop report of Russia is favorable. According to the reports received by the Ministry of the Interior up to August 16, the harvest of winter wheat in European Russia is now almost completely gathered, the yield, except in a few districts, being satisfactory, or at least an average one. The condition of the summer crops is generally good. In the Governments of Moscow, Smolensk, Kaluga, Pensa, Orel and Nijni-Novgorod the hemp seed and peas were first injured by insects, which, however, disappeared with the cool weather which subsequently set in. The damage caused in July by hail, from the effects of which the Governments of Poltava, Kursk and Kielce suffered most, is estimated altogether at about 3,000,000 roubles.

The so-called "jute bagging trust" excites unusual commotion at all the cotton-trade centers in the Southern States. The feeling thus aroused against alleged extortion is being turned to advantage for the encouragement of local industries. At New Orleans cotton planters are introduc-

ing what is called "osnabergs" of a heavy quality as a substitute for jute bagging, and in South Carolina a species of pine straw bagging is in high favor, after experiments to show that it is not only durable, but as well adapted as any other to resist the danger from fire. The National Board of Marine Underwriters decide that no discrimination will be made by them against cotton covered with any light-weight, close-woven material of reasonable strength.

There seems to be no real ground for the discussion which has arisen respecting the nationality of the soil upon which the St. Clair Canal was built, although it is conceded that had there been a slight error in its location Canada might well have disputed the title. A special dispatch to Detroit says: "Major Lydecker, formerly of Detroit, who was captain under General Cram, the engineer who had charge of the surveying of the line for the St. Clair Flats Canal, and David Enright, now topographer of the Post Office Department, who was engaged in the office with General Cram during the construction of the canal, are both thoroughly familiar with it. Mr. Enright said there is not the least doubt that St. Clair Flats Canal is in American waters. When the appropriation was originally granted a survey of the proposed canal was made by Captain Lydecker. This was the original survey, and established the axis or center line of the canal. When the canal was opened for traffic the Canadians gave out exultingly that the canal was in Canadian waters. This was 20 years ago. The Canadian newspapers having paid much attention to this matter, an order was sent to General Cram, the engineer in charge of the work, by General Humphrey, then chief of the engineers, directing him to resurvey the axis line, and a second time Lydecker established it by a very accurate survey of triangulation."

The annual statement of the Controller of the city of Philadelphia shows that the increase in property valuations during the year has been \$22,261,425, and there is an aggregate of over \$25,000,000 in the sinking fund toward the extinguishment of a debt of \$57,826,405. The Controller calculates that the present tax rate—\$1.85 on the \$100—will yield next year \$386,237.49 in excess of the amount which the same rate will yield in 1888.

The Canadian Pacific Company expect to have their extension across the State of Maine so nearly completed by the latter part of September that by using the track of another road a portion of the distance they can carry freight to and from St. Johns, N. B., thus coming in direct competition with the Intercolonial Railway, and also with other railways of Maine.

An action brought against the owners of grain elevators in this city will soon be brought to trial, to test the constitutionality of the new law regulating the charges for handling grain, which, it is said, is successfully evaded. The elevators, it is alleged, charge an excess of $\frac{1}{2}$ cent per bushel. When it was proposed to regulate and lower the price of direct transfers at the two ends of the canal it was shown by competent witnesses that if the reduction was made and maintained it would mean a vast increase in the volume of business, but for some reason it has not been enforced, and the State of New York and the people suffer in consequence, while the railroads prosper accordingly. One result is that much of the grain goes from the West through Canada to Europe, being forced outside of the State.

The New York, New Haven and Hartford Railroad Company have discontinued building their own engines and cars, as the shops are taxed to their utmost making necessary repairs to the rolling stock.

MANUFACTURING.

Iron and Steel.

William Grover, Rookery Building, Chicago, whose iron tank works are at East Chicago, has recently found his business accumulating so rapidly that he will be forced to extend his facilities. When his contemplated improvements are completed the works will have double their present capacity. His specialty is the manufacture of tanks to hold oil for fuel.

Ground will shortly be broken at East Chicago for the erection of a large car-wheel works. A plant is also to be built in the same locality for the manufacture of dump cars, stationary engines, &c. The names of the projectors are not yet announced, owing to the necessary settlement of some preliminaries, but definite arrangements have been made for the erection of both works.

The Union Steel Nail Company, of Omaha, Neb., have been offered a bonus of \$50,000 cash and four blocks of ground to remove their works to St. Joseph, Mo. It is understood that the offer has been accepted and arrangements made for the removal and re-erection of the plant, which is estimated to require about 90 days.

All departments of the plant of the Central Iron and Steel Company, of Brazil, Ind., started up in full on the 23d ult. with excellent prospects for a steady run.

The Brier Hill Iron and Coal Company, of Youngstown, Ohio, have purchased the old Eagle Furnace, formerly operated by the Eagle Iron Company, at Oreton, and will dismantle it. Part of the furnace will be removed to Brier Hill, and be erected there, and the remainder will be sold for scrap. It was one of the first furnaces erected in the Mahoning Valley, being built in 1846, by David Morris, Jonathan Warner, Harvey Sawyer and William Philpot. It has been idle since 1883. The above firm have just closed a contract with McClure & Schuler, engineers and contractors, of Pittsburgh, for the erection of a plant of the Massicks & Crooks patent fire-brick stoves for their Tod furnace. This is a new departure for the Mahoning Valley, being the first fire-brick stoves erected in the valley.

All departments of the works of the Belmont Nail Company, of Wheeling, W. Va., are being operated to their utmost capacity. The blast furnace of this company produced 3300 tons of Bessemer pig iron for the month of August, just closed.

Negotiations for the lease of the Laclede Rolling Mills are still in progress. Mr. Wilcox, president of the Western Steel Company, is reported as having made offers to take the works, and Colonel McNair, of the Missouri Furnace Company, has also been named in the same connection as a party in interest. The former operators of the works, the Laclede Plate and Sheet Mill Company, or at any rate Mr. Paddock, the president of that company, have also been negotiating to secure another lease of the works. We understand that a proposition has been submitted to Mr. Paddock by the Laclede owners and is now being considered by him.—*Age of Steel, St. Louis.*

It is proposed to build two 75-ton furnaces at Radford, Va., and Mr. George T. Mills, who is at the head of the enterprise, reports that \$270,000 have been subscribed, leaving only \$30,000 to be raised.

The syndicate of creditors who recently purchased the rolling mill plant of Graff, Bennett & Co., at Pittsburgh, are making preparations to put the Clinton Blast Furnace, which is located on the south side, in operation. After the furnace has been

started up and a stock of pig iron secured, the rolling mill will be put in operation. If the syndicate finds they are successful in running this plant the Clinton Rolling Mill will also be put in operation. All the old employees will be given employment if they are good workmen. The plant will be run by the same persons practically as it was when operated by Graff, Bennett & Co. The capacity of the Clinton Furnace is about 16,000 net tons of pig iron annually. It was built in 1859, and supplied the pig iron for use in the puddling furnaces of the mill. The mill was erected in 1846 and is one of the oldest in the country. It has 7 double and 19 single puddling furnaces, 11 heating furnaces, 6 trains of rolls, 42 nail machines and a plate mill.

A charter has been granted to the Boies Steel Wheel Company, of Scranton, Pa. The capital stock is \$500,000.

A new manufacturing corporation has been organized at Pittsburgh, under the name of the Hainsworth Steel Company, with a capital stock of \$500,000, and application for a charter will be made on the 26th inst. Those named in the application as members of the new corporation are William G. Johnston, John Irwin, Jr., Charles Bailey, Thomas C. Lazear, Stewart Johnston and William Lyon, all of whom are at present connected with the Pittsburgh Steel Casting Company. It is also stated that the company will include others equally as prominent in manufacturing circles. The object of the new company is to manufacture rolled cast-steel car-wheels by the new process, and under patents granted to Mr. Wm. Hainsworth, who has been superintendent of the Pittsburgh Steel Casting Company for many years and who will also act in the same capacity with the new concern.

Alice Furnace No. 1, of the Etna Iron Works, Ironton, Ohio, has been blown out for repairs. Blanche, of this company, which has been in course of erection for the past year, will be ready for operations about October 15th next.

Some time ago we made mention of the fact that the plant of the Wheatland Iron Company, at Wheatland, Pa., owned by the Woods heirs, of Pittsburgh, would shortly be put in operation, after an idleness of more than ten years. The new hydraulic machinery which has been in course of erection in the works for several months past, for the manufacture of skelp iron of large sizes, has been completed, and is now undergoing the preliminary tests. It has worked most satisfactory in every particular, and with the utmost smoothness and regularity. The principal part of this machinery is two large hydraulic tables, on either side of the three-high train of rolls. Each table is 50 feet and 3 inches long, and weighs over 22 tons. Each has a side motion of several feet, over which it travels at the will of the engineer, from one set of rolls to another, a perpendicular motion by which the iron is raised from the lower to the upper rolls, or *vice versa*, while the surface of the table is composed of a number of iron rolls, turning to or from the large rolls, for receiving or delivering the iron into them. All these motions are operated entirely by hydraulic power, furnished by powerful pumps, at a pressure of from 100 to 140 pounds to the square inch, and can be put in motion singly, doubly or all together, and stopped, started or reversed instantly at the will of the engineer. Mr. Mattock, of Pittsburgh, the hydraulic engineer who designed and built it, estimates that with three men and three boys it will easily handle 300 tons of iron every 24 hours; that ordinary mills handling the same quantity and kind of iron require 80 men or more on each "turn," a very material saving in labor. Mr. T. S. B. Wood,

of the Wheatland Iron Company, who has given the remodeling of the mill his personal supervision for the past year or more, expects to have the mill in operation and making iron within 10 days or two weeks.

Announcement is made that the prow for the United States cruiser, weighing 12,000 pounds, was successfully cast at the Union Iron Works, San Francisco, a few days ago.

The blast furnace of the Charlotte Furnace Company, Limited, at Scottsdale, Pa., manufacturers of pig iron, was put in blast on the morning of the 5th inst., after a stoppage of eight months, caused by labor troubles. In giving employment to the workmen no discrimination was exercised against members of any labor organization, and the force of men at work comprise a large number of the former employees of the company.

In answer to a report that the workmen in the employ of the Cherry Valley Iron Works, of Leetonia, Ohio, have gone out on a strike, we received the following advice from the company under date of the 4th inst.: "Last week our men (the top and bottom fillers and cinder men only) made a demand of 10 per cent. increase in wages. This we refused to give because we have always been governed by the wages paid in the Mahoning Valley, always paying the same as they do. The men were out two days when they frankly acknowledged being wrong in their demand, and asked to be restored to their positions. This we did, and the blast furnace started up on the morning of the 3d inst. at the old wages."

The New Castle Wire Nail Company, New Castle, Pa., have decided to erect a new wire-rod mill in connection with their works. The mill will be 1000 feet long, and will occupy several acres.

The Bessemer department of the Bellaire Nail Works, of Bellaire, Ohio, produced 6500 tons of steel during the month of August last, while during the same period the blast furnace produced 3964 tons of Bessemer iron. All departments of the works are in full operation with the exception of the nail factory.

The nail factory of the La Belle Iron Works, at Wheeling, W. Va., which has been idle for some time, resumed operations on Tuesday, the 4th inst. All departments of the company's plant are now in full operation.

Riter & Conley, of Pittsburgh, were successful on the 4th inst. in securing the contract for the Twelfth street viaduct in Chicago. The bids were as follows: Chicago Forge and Bolt Company, \$121,558; A. Gottlieb & Co., \$118,678; Detroit Bridge and Iron Works, \$112,020; Riter & Conley, \$109,348. The work is to be completed by April 1, 1889, under penalty of \$50 for every day beyond that date. The length of this viaduct is about two city blocks, and its width is 58 feet 3 inches. It will have two roadways and two sidewalks. It begins at the east line of Clark street, crossing the Chicago, Santa Fé and California and the Chicago and Western Indiana railroads.

The Viaduct Iron Mills, at Coatesville, Pa., which have been idle for seven months, have resumed operations. They were recently purchased at sheriff's sale by Worth brothers, who have other large iron mills at Coatesville. It is understood a new company being formed will also start up the Laurel Iron Works soon.

Machinery.

Dennison & Hamilton, 144 and 146 Lake street, Chicago, have purchased the Wilcox patent stove-pipe groover, and will hereafter manufacture it. This machine can be attached to any tinner's hollow mandrel,

and, when not in use, can be shoved back to the bench. With it a strong boy can groove 400 joints of pipe an hour and produce better results than an experienced man using the old style method. The machine can also be used in making large tin and galvanized-iron conductors. It is easy of action and is operated with an entire absence of the noise produced by the hand groover and mallet.

The Hughes Steam Pump Company, of Cleveland, Ohio, have just made a large export shipment of pumps through their New York Agents, Messrs. Donegan & Swift.

The works of W. P. Davis, of North Bloomfield, N. Y., builder of machine tools, were closed for a vacation on September 5, and will not be reopened before the 19th inst.

The Cooke Locomotive Works are about to be moved from the present site near Passaic Falls, in Paterson, N. J., to a more convenient location inside the city limits, but having spur tracks from the Delaware, Lackawanna and Western and the New York, Lake Erie and Western. The inconvenience of having to team all material as well as the finished locomotives through the streets is so great that it is surprising that the three locomotive-building firms at Paterson should still continue in such an inconvenient location. The new Cooke works will be carefully laid out and arranged on the most convenient plan that experience can suggest.

The Westinghouse Electric Company, of Pittsburgh, have in preparation a series of street car tests for the new Tesla motor. The motor has been reduced to convenient form for storing away in street cars, and several tests have already been made showing its adaptability to street work. The final trials now being arranged for will be of the severest nature. After they are over, if they prove successful, the motors will be put on the market. It is thought that one or two of Pittsburgh's street lines will adopt them if the tests are successful.

The Standard Underground Cable Company, of Pittsburgh, have received an order from the United Electric Light Company, of Springfield, Ohio, for two miles of cable, which will be used to extend the plant of the latter company.

A press dispatch from Wheeling, W. Va., under date of the 7th inst., says: "The Baltimore and Ohio Railroad Company, through their resident counsel, this evening announced to the Council Committee on Railroads that the company had their plans all arranged for the erection of a 32-stall round house, machine shops, not less than 120 feet square, and car shops, construction shops, blacksmith shops, paint shops and other buildings of proportionate size, work to be commenced at once. It was announced upon the authority of General Manager W. M. Clements that these buildings had been originally intended for the Philadelphia Division, but that the company had changed their plans.

During July and August of this year the Babcock & Wilcox Company, of New York, sold boilers amounting in all to 13,162 horse-power.

Among the late shipments of the Dwight Slate Company, Hartford, are ten fine bench lathes intended to make adjusting screws for the Edison phonograph, requiring 100 threads to the inch. Mr. Slate has invented a semi-automatic pinion cutter for small pinions, the index being worked by the reverse motion of the lever.

The Billings & Spencer Company, Hartford, are making a new style seal press for the Keystone Seal and Press Company, New York. It is intended to take the

place of the crude machines now in use, and is being adopted by the railroads to detect the opening of cars *en route*. The W. A. Wood Mower and Reaper Company, Hoosac Falls, N. Y., have just placed an order with them for 40,000 Pitman eyes, weighing over a pound each.

The Chase Turbine Mfg. Company, at Orange, Mass., will shortly occupy their new foundry, which is now about completed.

The Farrel Foundry and Machine Company, Ansonia, Conn., are at work upon the foundations of a new shop 100 x 250, which, when completed, will be used for a foundry. It is to be situated at the north end of their present shop.

Hardware.

The New Castle Wire Nail Company, of New Castle, Pa., are at present considering the question of erecting a steel wire rod mill adjacent to their present works. The company draw their own wire, but on account of difficulty in procuring rods as fast as needed they have about concluded to build a rod mill.

The McCosh Iron and Steel Company, at Burlington, Iowa, are reported to be running their wire nail department full time, and will soon start up their barbed wire works, which have recently been closed down for repairs. They have put in additional engine and boiler capacity with a view of having sufficient power to operate a wire-drawing plant of their own, which they contemplate putting in at some future date should the market price of wire advance too freely.

The works of the Hermann-Parker Hardware Mfg. Company, on Twelfth street, St. Louis, will be dismantled. The lease on which they stand will expire soon, and it is impossible to sell the plant as a whole to any advantage.

R. Wallace & Sons Mfg. Company, Wallingford, Conn., have recently added a new building to their plant, put in new boilers, and in other ways increased the capacity of their factory.

Miscellaneous.

G. W. M. Reed, G. H. Rossett and J. W. Cotton have secured a charter from the State of Illinois for the United States Cold Bending and Coiling Pipe Company, of Chicago. The authorized capital is \$250,000.

The Youngstown Stamping Company, of Youngstown, Ohio, manufacturers of stamped and tinware, have leased a glass plant in the above-named city and will put it in operation as soon as repairs and new improvements can be made. The company use a large amount of glass jars in making oil cans and other specialties they manufacture, and find they can manufacture this glassware much cheaper than it can be bought from dealers.

The organization of the Novelty Steel Wheel Company, with a capital of \$500,000, has been completed in Pittsburgh. It is proposed to go into the manufacture of steel vehicle-wheels, the invention of Dr. A. C. Hall. Interested in the company are Geo. W. Everson, late of the Scottsdale Iron Works. A plant costing \$100,000 will be erected in Little Washington immediately, having a capacity of 30,000 wheels yearly, or 100 sets per day. It will afford employment to 200 men. One buggy manufacturer has submitted an offer to purchase the entire output for a year.

The Tanner Anti-Friction Wheel Company have been chartered at Chicago with a capital of \$500,000. The incorporators are Warren G. Purdy, Frederick W. Porter, Samuel W. Tanner, Frank L. Strong and George H. Fergus.

Protection and Progress.

In our recent article on this subject we advanced the proposition that the protection against unrestricted competition afforded by the patent laws and the tariff operated directly to encourage that free interchange of ideas which is the secret of progress. And we think it not difficult to show that the tariff, in particular, may effect in this way a benefit for the whole civilized world, in comparison with which all the arguments, pro and con, as to its other economic effects become relatively insignificant.

The history of the Bessemer manufacture affords a striking illustration. This industry is the favorite theme of those who denounce the protective tariff as the creator of odious monopolies. We hear abundantly of the vast sums which the Bessemer manufacturers have taken from the helpless consumers to enrich themselves. It is not our purpose now to argue that proposition; but we must say, in passing, that the history of the Bessemer business in the United States is by no means the history of a pampered favorite, secured by a sovereign grant in the enjoyment of a sinecure. Whoever will inquire into the struggles, perplexities, losses and failures of its pioneers in this country will confess that they paid dearly for the prosperity of some of their successors. Moreover, it was essentially the patent monopoly, rather than the tariff, that protected them. If there had been no tariff at all, a still completer protection might have been secured (as it frequently is, in similar cases) by an agreement with the owners of the Bessemer patents abroad, giving to the American licensees the exclusive possession of this field.

But what we wish to consider at present is the effect upon progress, both here and abroad, produced by the establishment of the Bessemer manufacture in this country. Without disparagement of the enterprise conducted at Wyandotte, where the first American Bessemer steel was made in 1864, it may be said that the business fairly began with the building of the works at Troy by the late A. L. Holley. Mr. Robert W. Hunt, himself at one time superintendent of the Wyandotte works, declares, in his "History of the Bessemer Manufacture in America," that the Troy establishment was the first to bring the process near to a commercial success. How many times it came near, even in Holley's hands, to commercial ruin, those to whom he confided his troubles and anxieties know well enough. Mr. Hunt's admirable historical sketch, just mentioned, will be found in the Transactions of the Institute of Mining Engineers, Vol. v. p. 201. It presents a vivid picture of the small and perilous beginnings of this great enterprise, and offers a noble tribute to the courage and genius which finally achieved a triumph. The

following paragraph contains in a nutshell the moral of the story :

I must here state that, after building the first experimental plant at Troy, Mr. Holley seems to have at once broken loose from the restraints of his foreign experience, and to have been impressed with the capabilities of the new process. The result is that, mainly through his inventions and modifications of the plant, we in America are to-day enabled to stand at the head of the world in respect of amount of product.

It is not necessary to describe in detail the successive steps by which this result was accomplished, and in which Holley was nobly assisted by Hunt, Fritz, Jones and others. The result itself is what we wish to emphasize, and this is shown most forcibly by a few figures, representing the productive capacity, at various periods, of a two-converter Bessemer plant. Twenty years ago the capacity of the Troy works was claimed to be 40 tons of ingots per day, but this was only the ideal aimed at. It had never been realized. It was in 1868 that Holley proudly announced that his dream of 40 tons per day had been made true at the Harrisburg works. Eight years later, in 1876, Mr. Hunt reported the best achievements of various American Bessemer works up to that time, as follows:

	One day.	One week.	One month.
Pennsylvania.	281	1291	5455
Troy	297	1475	6051
North Chicago	330 1/4	1583	6457
Joliet	350	1528	5367
Edgar Thomson.....	265	5403

But the climax was not reached, even by these extraordinary achievements. We can scarcely venture to-day to state the best work performed by two converters, lest we might do injustice to some establishment which had already surpassed it. But if we take as an example the reported operations of the Union Steel Company, of Chicago, in May last, when, in 50 12-hour turns, 28,145 gross tons of ingots were made—a product nearly five times as great as the best of 1876, which was itself more than five times the best of 1868—we show sufficiently what American genius has done with the Bessemer process. It should be added, however, that this vast quantity of ingots was simultaneously rolled, making, for one month, 24,953 tons of blooms and 22,808 tons of rails.

The commercial result in the United States of these and kindred improvements has been to reduce the price of steel rails from \$167 to less than \$30 per ton. The effect abroad has been equally remarkable. In 1868 the announcement of 40 tons as the daily capacity of two converters was received in England with incredulity. Five years later the reports from American works were similarly disbelieved. But facts were too strong to be resisted. Holley, Wm. R. Jones and others put their figures freely before the British Iron and Steel Institute, and the foreign ironmasters were made welcome at American works. The result was the gradual adoption of American designs and methods everywhere. At each step of our advance the same phenomena repeated themselves; disbelief, reluctant admission, eager imitation. It is not too much to say that in this manufacture Americans have dragged the world after them. That steel rails are to-day cheaper than iron ones is a boon which the English or European consumer, quite as truly as the

American, owes to Holley and his colleagues.

The cheapening of transportation thus effected has revolutionized the relations of agriculture. This it is that has made possible the sending of wheat from Dakota to Liverpool. But we need not undertake to review the wide effects of the Bessemer manufacture. They are admitted by all—even by those who seem not to be aware that Americans chiefly brought about the grand result; that they would not have undertaken it at all without protection against foreign competition, and that being so protected they freely communicated to the world their plans and operations, to the unspeakable advantage of all.

The Blast Furnaces on September 1.

During the month of August there has been quite a notable addition to the furnace capacity actively at work, the improvement being confined almost exclusively to the coke furnaces. In the aggregate the figures show the following:

	Anth.	Coke.	Charc'l.	Total.
Aug. 1, 1887.....	37,330	62,001	11,533	111,554
Sept. 1, 1887.....	38,338	83,124	11,505	132,967
Aug. 1, 1888.....	33,397	74,855	11,137	119,389
Sept. 1, 1888.....	33,541	81,032	11,243	125,966

While we have not reached the totals of last year, it is probable that within the current month, and certainly in October, the coke furnaces will go up to 83,000 tons. From the present outlook, however, little progress is expected in anthracite pig iron.

The status of the anthracite furnaces was as follows on the 1st of September:

Anthracite Furnaces in Blast September 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	26	8	2,755	18	4,135

Maryland.....	4	0	0	4	462
Total.....	186	92	33,541	94	21,674

Again, there has been a slight increase in the capacity blowing, although the large figures of last year have not been reached. We do not hear of any marked movement to increase the number of active plants running on anthracite, as a fuel. For a year past our records show the following figures:

	Furnaces in blast.	Capacity per week.
September 1, 1888.....	92	33,541
August 1.....	93	33,397
July 1.....	92	32,478
June 1.....	99	32,418
May 1.....	96	31,003
April 1.....	94	30,496
March 1.....	98	28,598
February 1.....	97	29,989
January 1.....	118	38,206
December 1, 1887.....	122	39,487
November 1.....	124	40,028
October 1.....	123	39,440
September 1.....	125	38,338
August 1.....	129	37,930
July 1.....	138	40,742

In New Jersey, Secaucus is out, leaving only Oxford, Franklin and Warren at work, with Chester Furnace still banked. In the Schuylkill Valley there have been no changes during August. No. 1 Phoenix was off three weeks with a chilled hearth,

but had recovered and is again running regularly. Warwick was obliged to stop for 13 hours on the 22d ult., on account of the high water in the Schuylkill River, which covered the east house to a depth of 2 feet. Norway has begun to reline and may blow in during October, although it is probable that it will be later. In the Lehigh Valley one of the Coplay furnaces resumed, but, on the other hand, one of the Crane stacks went out. A new hot-blast stove is being added to the equipment of the spiegel furnace of the Lehigh Zinc Company. The product of the furnaces working has been 44,210 in August. In the Upper Susquehanna Valley the Pennsylvania Steel Company are taking down one of their plants, leaving four at work, which have, however, made a very heavy product in August, so that the total of the district was 21,300 gross tons. Katherine blew in on the 29th ult. In the Lebanon Valley the same furnaces are running, their August product being 29,578 tons, of which 20,946 tons were made by seven furnaces, the largest producer of all being the Robesonia. In the Upper Susquehanna Valley the same eight stacks which have been at work for months past made 12,013 tons in August, as compared with 11,529 tons in July. The reports from the furnace companies do not indicate any tendency toward resumption among the idle plants—in fact, some of the companies which blew out during the depression state directly that as yet they do not see enough encouragement to warrant a return to work. What changes there have been and are contemplated are merely brought about by the completion of repairs in progress.

The position of the coke furnaces was as follows on the first of this month:

Bituminous and Coke Furnaces in Blast September 1.

September 1.....	145	83,124
August 1.....	113	62,091

It will be observed that there was an increase in the capacity blowing of over 6000 tons per week. In this New York, the Shenango Valley, Illinois, and notably the Wheeling district participated, while the South, the Pittsburgh district and the Mahoning Valley remained stationary.

In the Pittsburgh district Clinton Furnace, of Graff, Bennett & Co., which has been idle since the failure of that firm, will be put in blast during the present month by the syndicate of creditors who recently purchased the plant. Edith will not be ready for blast before next month. It is being relined and otherwise repaired. Lucy No. 2 was blown out on August 16 for relining and will not be ready for operations before the latter part of October. Soho is almost ready to resume and may go in this month.

In the Shenango Valley Keel Ridge blew in on the 16th ult., and one of the Sharon Iron Company's furnaces was added to the active list during the month. Rosena is to become a producer in a short time. Neshanock, with its increased equipment, made a large product during August, putting it into the ranks of the largest producers in the country. The total output of the valley was 33,883 gross tons for August. In the Juniata and Conemaugh valleys the active capacity was reduced by only one small plant, the August output footing up to 25,273 tons. In the Youghiogheny Valley Charlotte has lately blown in, and Rebecca is soon to resume operations. Centre Furnace is again in blast. During its stoppage eight new boilers have been added to the plant. There is great activity in the Mahoning Valley, where the August product was 32,534 gross tons. A number of the producers report to us that the demand is very heavy, one of them writing:

"Never in our 20 years' experience have we had such a demand for our iron. We stopped selling a month ago, and yet our order book is getting ahead of us by merely trying to take care of our customers." We may state that the company quoted make a specialty of foundry irons and of American Scotch. From the Hanging Rock region, the owners of the Eliza report that they expect to discontinue iron making after October 1st, when the present stock will be used, until prices improve materially. Star is banked for repairs, which it is expected will be completed by the 20th inst. Tropic, as already reported, blew in on the 20th ult. In the Hocking Valley Crafts is soon to smelt, and Fannie is to follow in a few weeks. The only item worthy of mention in connection with the furnaces of Central and Northern Ohio is that Emma started on the 30th ult. In West Virginia Riverside has resumed, and Top Mill which is being relined is expected to resume by the beginning of next month. Illinois is again coming up. Chicago Furnace blew in on the 1st inst., and three of the South Chicago furnaces are at work, with their aggregate capacity of over 4000 tons a week. Union is running three stacks. In Wisconsin Mayville was compelled to blow out on the 16th ult., on account of the bad condition of the bosh wall. It is expected to be in operation again on the 1st of October.

For convenience sake we have grouped together those States usually known in the iron trade as the South. We have not included West Virginia, because practically the furnaces of Wheeling form a district

of their own with a number of the Ohio plants. In Alabama one of the Sheffield and Birmingham Company's furnaces chilled soon after blowing in, and the Sheffield furnace is idle. Bibb, one De-Bardeleben, two Eureka, Mary Pratt, Pioneer, one Sloss, two Alice, two Ensley and one Woodward are running. Williamson is out for repairs. The second De-Bardeleben is to be blown in by the end of October. Gadsden and one of the new Sloss furnaces are to go in this month. In Georgia Cherokee is to be relined, and a new hearth is to be put in.

In New England Kent Furnace began operations toward the close of last month. In New York Copake is out. In Virginia Walton was just filling in on the 1st and has begun work. In the Hanging Rock region Jefferson ran only a part of the month. Mount Vernon lost two weeks in August putting in a new hearth, and Olive is temporarily idle for repairs, to be followed by a regular run. Vesuvius produced during the greater part of the month. In Michigan the Detroit and Elk Rapids went out, the latter on the 23d ult. Fayette lost five days through an explosion on the 19th ult.; still the total product of the State for the month was 16,526 tons. One of the Eureka furnaces blew in on the 25th ult. In Wisconsin Hinkle furnace at Ashland resumed on the 22d ult. In the South the only change is that Tecumseh is out for repairs. Rock Run has stopped since the 1st to put in a new hearth and make general repairs. From the Northwest notably come reports that the furnaces are sold up to the close of the present year and beyond that time.

Hardly a day passes but witnesses an attack in the daily press upon the steel rail combination. Classing them among the worst of the iniquitous "trusts," these writers tell the public that the mills have combined under the shadow of an outrageously high duty to rob the country annually of untold millions. The remedy, of course, lies in reducing the tariff, and with that object in view absurd misrepresentations, like Scott's statement of cost of manufacture, are kept going persistently. It is argued that the "steel barons," secure from the intrusion of foreign makers, have killed competition at home, and that the English or German rail maker is the only one who can save an afflicted consumer. The steel rail manu-

facture is the pet example of those who hold the views to which President Cleveland has again given expression in the letter of acceptance just published, in these words: "We believe that these trusts are the natural offspring of a market artificially restricted; that an inordinately high tariff, besides furnishing the temptation for their existence, enlarges the limit within which they may operate against the people, and thus increases the extent of their power for wrongdoing. With an unalterable hatred of all such schemes, we count the checking of their baleful operations among the good results promised by revenue reform." It has always been amusing to those familiar with the history of the foreign iron trade to have steel rails quoted as an example of the alleged close relation existing between trusts and protection. For years the steel rail manufacturers of England and Belgium, both free trade countries, and of Germany, which has a moderate protective tariff—for years makers of these three countries worked under an international syndicate which parceled out the world's markets between them. Now, almost on the day on which the President's letter was published, comes the news that this international association has been once more organized. It is reported that not alone have all the makers of England, Belgium and Germany joined it, but that this time the French works are in the trust. What an added temptation to harmony would be the possession of even a part of the markets of the United States, with their consumption equal at times to that of the rest of the world taken together!

Elasticity of the American Iron Trade.

While the alternate "booms" and depressions in our domestic iron trade are regarded with much solicitude by political economists, some of whom fancy that to correct such irregularities an easy remedy exists in the abolition of tariff duties, yet the manner in which the trade accommodates itself to these varying conditions challenges admiration. The rapidity with which the United States has advanced in the manufacture and consumption of iron and steel, until it now practically occupies first place among the nations of the world, is one of the marvels of the century. It would have been better for all interested if this advance could have been made gradually, each year showing an increase as compared with its predecessor, instead of moving fitfully as it did, sometimes taking leaps and bounds and at others halting, if not retrograding.

Taking the production of pig iron, for instance, to go back no further than eight years, remarkable fluctuations in production are seen. From 1879 to 1887 the output of the blast furnaces of the country more than doubled, amounting to 6,417,148 gross tons the latter year, against 2,741,853 tons in the former year. In this period some years showed a gain of over 1,000,000 tons on their immediate predecessors. In one year, 1886, the increase was over 1,500,000. Yet there were in the same period some years of depression in which the production of pig iron showed a decrease, notably in 1884, when there was a decline of 500,000 tons as com-

pared with the previous year. It is a very simple task to ascertain the net increase in production in these eight years—namely, 3,675,295 gross tons, and dividing that quantity by eight obtain 459,412 tons as the average yearly gain, and theorize as to the more healthful condition of the trade if each year had shown just about such an increase.

Steel rails could be taken in the same way. In 1879 their production, including open-hearth rails, was but 618,851 gross tons, whereas in 1887 the output had grown to 2,119,049 tons, or considerably more than treble. But, notwithstanding the huge net increase, there were years during that period when the production declined instead of advancing. The three years covering 1883 to 1885 witnessed such a movement. But in both 1886 and 1887 an enormous development occurred, the mere gain in each year equaling the entire production of 1879. If the annual increase in production from 1879 to 1887 had been distributed evenly throughout that entire period, each year would have shown a gain of 187,524 tons over the output of the previous year. It is unnecessary for purposes of illustration to take up any other branches of the iron and steel trades, as in the production of all staple articles similar conditions have prevailed.

In no other country in the world do seasons of prosperity cause such an increase in the consumption of iron and steel as in the United States. The rapid growth of population, the enterprise of capitalists in building new lines of railway wherever opportunities of profit are seen either in constructing or operating them, the constantly developing riches of our natural resources and the superiority over other nations of the purchasing power of the masses of our people combine to make the consumption of all classes of products greater *per capita* at any time, but this consumption increases enormously when general prosperity abounds. Our manufacturers then expand their facilities to meet the increased demand upon them, manufacturing establishments multiply, more workmen are called in, new districts are developed, improved methods for securing an enlarged output are devised, and in every way the productive forces of the country endeavor to prove themselves equal to the emergency.

When the active movement has exhausted itself, however—or, in other words, when the floating capital of the country has been absorbed in permanent improvements, a season of rest and recuperation follows, consumption of iron and steel decreases, and manufacturers find themselves with a diminished market. They then quickly adjust themselves to the new condition of affairs. Blast furnaces are blown out by their owners, who prefer to have them stand idle rather than to turn out pig iron for which there is no immediate demand. Possibly the avoidance of the British policy of accumulating large stocks of pig iron in the hands of furnacemen has much to do with the usual rapid recovery of our pig-iron trade from extreme depression. Rolling mills and steel works also restrict their output to the requirements of the situation, and all along the line, from the producers of raw material to the manipulators of the highly finished product, the aim is toward

further curtailment, unless in their restless enterprise individual owners happily discover some new outlet into which they can direct their product.

Under such circumstances as here have been portrayed a gradual increase in production from year to year is impossible. The iron and steel manufacturers do not control circumstances, but, on the contrary, are controlled by them. Even if they had a foreign trade it would necessarily be subject to similar fluctuations.

We have just passed through one of these seasons of curtailment of production, following a period of great activity. Now the skies are again brightening, and the indications favor a renewal of the demand for iron and steel which may perhaps test the capacity of our works and put to rout the prophets who have been predicting disaster as a result of the large number of new establishments built in various parts of the country, but particularly in the South. It would not be at all singular, but in strict accordance with our past experience, if it should be found that these new works, instead of proving a menace to older establishments, have simply been erected in time to meet the requirements of another period of increased consumption.

The Cullom Bill Against Trusts.

Senator Cullom has introduced a bill which thoroughly shows that there are at least a few public men who are willing to become the leaders in a crazy crusade against all associations formed to regulate trade. We have repeatedly emphasized the point that there is some danger that popular opposition to a few gigantic trusts may lead to an indiscriminate assault upon trade associations and combinations. To what lengths such men are willing to go is well illustrated by the bill in question, of which the following is a synopsis:

By the first section all arrangements, contracts, agreements, trusts or combinations between persons or corporations or between persons and corporations, made with a view or which tend to prevent full and free competition in the production, manufacture or sale of any article of domestic growth, production or manufacture, or in the importation of any article produced or manufactured in a foreign country, or in the sale of any article imported into the United States, or which tend to advance the cost to the consumer of any such articles, or which tend to create any restriction upon Interstate trade, or any importation or exportation, or which tend to limit or reduce the production, manufacture or sale, or to increase or reduce the price of any article of growth, production, or manufacture that enters into trade between the States or Territories, or which tend to create a monopoly, are declared to be unlawful combinations, and to be against public policy, unlawful and void. The second section provides that any person entering into any such combination on his own account, or as agent for another, or as an officer, agent or stockholder of any corporation, or as a trustee or committee, or in any capacity whatever, shall be guilty of a high misdemeanor, and be subject to a fine of from \$1000 to \$10,000, or imprisonment from one to five years, or both, in the discretion of the court.

Section 3 provides that all shares of stock and all real and personal property belonging to any such unlawful combination, or to any of the parties thereto, which may be placed in trust or used in furtherance of the purposes of any such unlawful combination, together with all articles of property grown, produced, manufactured, imported, held or kept for sale to advance the purposes thereof shall be forfeited to the United States and liable to seizure.

Section 4 makes it the duty of Customs officers to seize and secure shares of stock and real and personal property made liable to seizure by the bill, and provides that the same proceedings shall be had for the seizure, condemnation and sale thereof, as in cases of seizure of property under the revenue laws. Section 5 provides that out of the proceeds of such sales there shall be paid: First, all costs of seizure, condemnation and sale. Second, claims of the United States for duties or taxes. Third, liens for State taxes and assessments. Fourth, unpaid judgments against parties convicted as parties to such unlawful combinations. Fifth, claims provided in favor of persons injured by means of such unlawful combination.

Of the balance one-half is to be paid into the United States Treasury and the other half distributed to the parties interested.

Section 6 authorizes that any person or corporation injured or damaged by such unlawful combination to sue for and recover double the amount of damages suffered. Any one of the parties to such combination may be made defendant in such suit.

Section 7 provides that the purchase of merchandise or commodities in any foreign country for sale in this country, or in any State or Territory, by any such unlawful combination or its agents, shall constitute a violation of the act and subject the offender to the penalties prescribed.

Section 8 provide that when any action at law or suit in equity shall be commenced in any United States court it shall be lawful in defence thereof to plead in bar or in abatement that the plaintiff, complainant or any other person interested in the prosecution of the case is a member or agent of such a combination as the bill declares unlawful, or that the cause of action grows out of such a combination or out of some business or transaction thereof.

In other words, confiscation of half their property besides the infliction of fines and imprisonment to individuals are to be meted out to those who enter into or are in any way identified with trusts or combinations. Such a proposal deliberately brought before the highest legislative body of the land is not worth serious consideration for its own sake, because the business men of the country have too commanding a voice in its councils. But the very fact that such a bill could be drawn up and presented is in itself significant. To us the proposal to put every trade association into one category is the most striking feature. It is quite useless to deny that public opinion condemns organizations like the sugar trust. Means are being earnestly sought to reach them, and to check the tendency toward forming similar enterprises in other trades. It is possible that opposition to them may become so strong that the tentative measures adopted will bear heavily, not alone on those whom it is the object to reach, but will strike others who should be let alone. Senator Cullom's bill can never pass, but it is not impossible that legislation containing features highly injurious to the manufacturing and trading interests of the country may be approved in a rush to catch popular favor by crushing trusts

The recent advance in old rails has again brought up as a subject for discussion the question how large is the reserve of that rare material still in the tracks. We hear the opinion frequently expressed that before long the supply will be exhausted, and that then certain industries dependant upon old iron rails will be forced to turn to something else. Yet the day when the last iron rail will be taken up is further away than the majority of those interested seem to think, unless the data collected by the authors of Poor's Manual are based

on inaccurate returns. The following statement of the numbers of miles of steel and iron rails in the tracks in the United States shows that nearly one-third of the total track is still equipped with iron:

Year.	Miles steel rails.	Miles iron rails.	Total miles.	Per cent. steel of total.
1880.....	33,680	81,967	115,647	29.1
1881.....	49,063	81,473	130,536	37.5
1882.....	66,091	74,369	140,460	47.3
1883.....	78,491	70,692	149,183	52.7
1884.....	90,243	60,254	150,497	57.6
1885.....	98,112	62,495	160,607	61.0
1886.....	105,724	62,324	168,048	62.9
1887.....	128,950	60,388	189,337	68.1

In seven years the mileage of iron rails has been reduced by 21,579 miles, so that at the same rate of exhaustion the supply would last nearly 20 years longer. Of course there are many considerations influencing the rate at which our bar mills and the works running on track material draw on the reserves. The questions of the relative cost of new steel rails, of accessibility of the old material, of the future demand for finished product, of the relative cost of old iron and new steel, angles, bars, spikes, &c.—all these considerations affect the problem. But the scare of an early end of the supply of old rails may as well be dismissed. They will last ten years longer at least.

Relations with China.

There is reason to fear that the hasty rejection of the Chinese treaty by both houses is a grievous mistake. It is an offense against a friendly power that cannot be justified. Moreover, the legislation proposed assumes that evils exist which are merely hypothetical. Under the present laws no invasion of Chinese emigrants has occurred which need excite alarm. Taken at the worst, the bland and meek-eyed Chinaman is not to be compared with specimens of some other nationalities. It is to be borne in mind that there exists a British influence exceedingly hostile to American interests in China, and is quick to turn to advantage any legislation inimical to the Chinese Government which may take place in the United States. Therefore, it is hardly worth while to hazard international relations and to embarrass our foreign commerce with a vast empire like China, to say nothing of the injustice involved, while seeking to correct evils more imaginary than real, and which may exist only somewhere in the remote future.

It is doubtless true that China is now entering upon an eventful period in her history; momentous changes affecting her civilization are imminent. At this moment several important enterprises are pending in this country, prominent among which are grand schemes for railway improvement to which the Government is impelled to commit itself, however, reluctantly in consequence of advances making by Russia in the same direction. A new system of finance is also in contemplation, as seen by the negotiations of Count Mitkiewicz, Mr. Barker and others of the alleged American syndicate. Americans have ranked high in the estimation of the leading statesmen of China, and there is reason to believe that American influence might acquire an important ascendancy both in diplomacy and in trade, as compared with Great Britain or any power, were it not for the rash and ill-considered measures agitated at Washington.

CORRESPONDENCE.

The Chemistry of Foundry Irons.

STIRLING FURNACE, STIRLINGTON, N. Y.,
September 8, 1888.

To the Editor: I regret that I have been unavoidably delayed in answering the valuable contributions on above subject from Messrs. Chauvenet, Birkinbine and Uehling, but will now take them up separately and make a few remarks on some of the main points presented by them.

By adding the point made by Mr. Chauvenet on the amount of graphite present in open and close iron, I must certainly modify the latter part of my sentence, viz.: "An open iron was sure to have a high percentage of graphite, and a close iron a low percentage of graphite." This sentence was carelessly written, for the latter half should have been omitted as misleading. I am grateful to Mr. Chauvenet for having called attention to it, as it might have led to difficulties had a furnaceman tried to induce a founder to accept a close-grained but graphite iron, such, for instance, as mentioned by Mr. Chauvenet. The point I endeavored to make was that in an open foundry iron graphite was sure to be sufficiently high for all its purposes, and at present, while the founders will accept nothing but open-grained iron, it would have been waste of time to determine graphite in every sample. I fear it will remain so for some time to come to analyze close iron for graphite, as the average founder would not accept it, no matter if told it contained 4 per cent. of graphite. The point here discussed was very excellently stated in one of your editorials. It is just on this point that analysis would be of great value to the furnaceman, if he could only get the founder to accept analysis as one of the tests of the iron. Of course it is necessary to have physical tests, such as Keep's, go hand in hand to obtain the best results, but even analysis alone would be an important factor if thereby such iron as described by Mr. Chauvenet could be sold on equal terms with open iron from the same cast, for such iron is certainly of equal value with the open iron. Yet it may prove hard to convince the skeptics in the foundry trade of this.

I was much interested in the statements made by Mr. Birkinbine regarding cost figures of Scotch irons at Memphis, which show plainly how far even the financially far-sighted American founder will go in paying excessive prices for the sake of getting what he assumes to be the only kind of iron, when he can get exactly what is needed for a much lower figure. At the same time, we must not forget to look at his side of the question. He is undoubtedly influenced by the fact that, apparently, the American furnaceman has not fully possessed the same knowledge of exact quality nor the same regularity of product as possessed by the Scotch furnaceman, and that he (the founder) has therefore really not been able to get just what he needed with sufficient regularity, and hence would run risks, which made him prefer the higher priced but surer article. Yet it seems to me where the founder is at present to blame is in the apparently utter indifference of all but the largest concerns to all questions of scientific import, thereby naturally discouraging the progressive furnaceman from adopting a scientific basis; for certainly, if the founder is not going to encourage the furnaceman in his efforts it will not pay the latter to go ahead, spend the money, and yet have as hard a time as before to convince his customers of the quality of his metal. The almost total absence of all reference in foundry papers on the remarks of Messrs. Chauvenet, Birkinbine and

Uehling certainly seems to give proof to the above remarks.

I furthermore agree perfectly with Mr. Birkinbine in contravening the statement that the analysis will settle the quality of the iron, for the defining of the analysis must be accompanied by physical tests, such as Keep's tests.

There is one point about Mr. Uehling's interesting letter that I would caution against. He speaks about iron being chilled by running into wet beds, and infers that it may be as good as the rest of the chilled iron. I do not believe he meant it in that way, but it reads so, and might be misleading. The close iron can only have the same value if it has the same graphite. Close iron made in the way described by Mr. Chauvenet—i. e., run a little slow, but not chilled—will have practically the same graphite while chilled iron will not—its graphite having been converted into combined carbon. This is especially instanced in the last part of my original notes and analysis on sows and pigs.

As to Mr. Uehling's final statement that the value of graphite is overestimated, I am hardly prepared to accept that *in toto*, judging from all experiments and general information on the subject. Yet he may be nearer right as to the ultimate results than I am. Furthermore, the very interesting, and, if fully sustained, very valuable, work of Messrs. Keep, Maybery and Vorce on the effect of aluminium on foundry irons seems to point very strongly to the fact that graphite is the ruling factor. If you will permit me I will make a few remarks on this work, as also on the discussion between Messrs. Keep and Hammer, in your next issue.

I will now, in conclusion, call attention to a very thorough series of experiments made by the German Government, in 1877, under the direction of Wachler, at the instance of a number of leading German ironmasters. The conditions there existent were similar to ours here, but in a stronger degree. Scotch and English irons ruled the market on the upper grades; all foundries used these as their fundamental compounds, to the detriment of the German irons, which they considered inferior. The Government was finally induced to undertake comparative investigations between German and foreign works, which, when conducted with the utmost impartiality, proved the full equality of the two works and sufficiently stirred up the German foundries to the actual conditions, eventually greatly benefitting the home industries. But, as a sad commentary on the doctrines of free trade, a supplementary note by the author, a few years later, stated that although the scientific gains had been very great the actual gains, owing to then existent free trade, had been practically *nil*, as the foreign irons, owing to the peculiar adaptability of Great Britain for cheap iron manufacture, were put on the German market at such greatly lower prices that in spite of an increased demand for German irons these were unable to compete in price, and many works forced to shut down.

CARL A. MEISSNER.

Influence of Aluminium Upon Cast Iron.

BRADFORD, CONN., September 11, 1888.

To the Editor: Permit me, Mr. Editor, to thank Mr. Keep for the additional facts submitted in his letter of September 1. It seemed to me that to a cautious reader of his original paper this supplementary information was essential to an appreciation of the precise value of his experiments; but, even in the new light, it cannot but appear desirable that the introduced aluminium should be free from the company of that most potent element in determining the physical status of cast-iron—silicon. Mr. Keep seems inclined to doubt the ef-

fect of small quantities of silicon, but he shows his entire understanding of the subject by adding: "Although, by inference, we have a right to assume that any amount of silicon does produce a corresponding effect." However, we are not left to the philosophy of inference in this matter. In the words of Mr. Outerbridge—quoting from his paper in the Franklin Institute *Journal* for March: "A very small variation in the percentage of silicon produces a prodigious effect in this particular"—referring to the influence of silicon upon chilling quality. The researches of Mr. Ford in accounting for the great difference in the working of hot and cold blast pig iron and in discovering the qualities which determine the durability of car-wheels, also the experiments of Colonel Caron, a French scientist, who, in testing steels, discovered the property that minute quantities of silicon have, in obstructing the process of hardening by retaining the carbon in a graphitic or semi-graphitic state—such results, it seems to me, may be taken as definitely establishing the fact that "any amount of silicon does produce a corresponding effect." But precisely what this effect shall be cannot—in the present state of our chemical knowledge—be predicted.

Aside from the mistake in quoting the amount of sulphur, which was either a slip of the pen or the printer's fault, I think this is where Mr. Keep misunderstands me; for in venturing the statement of the effect of small quantities of silicon I did not intend its application to the particular iron he dealt with, but rather to publish my own experience with some irons and to show that in some cases sufficient silicon might be introduced in such an alloy to materially affect the mechanical properties of the iron. The sensitiveness of cast iron to the introduction of silicon would seem to depend upon the proportion of the contained phosphorus, sulphur, and especially manganese, and it can be readily understood that the same quantity of silicon which added to one iron would effect a complete change might in another case produce no appreciable effect. My knowledge of this fact would of course have prevented me from making any assertion with regard to the particular irons used by Mr. Keep; but as an interested and appreciative reader of his paper it seemed to me impossible to arrive at even a general conclusion touching the influence of aluminium until it was known what account had been taken of the introduced silicon. Thanking Mr. Keep again for the courtesy he did me by his reply, I am, Mr. Editor,

Yours truly,

ALFRED E. HAMMER.

The Naval Reserve.—The *Marine Journal* publishes the following list of American steamers which will answer the requirements of the Naval Reserve bill in regard to speed:

Vessel.	Halling Port.	Tonnage.	Speed.
Newport.	New York.	2,735	17.9
City of Augusta.	Savannah.	2,870	16.5
City of Puebla.	San Francisco.	2,824	16.5
Queen of the Pacific.	Portland, Ore.	2,728	16.7
Alameda.	Philadelphia.	3,158	16.5
Mariposa.	San Francisco.	3,158	16.5
State of California.	San Francisco.	2,208	16
Alliance.	New York.	2,985	16
Louisiana.	New York.	2,840	16
Ohio.	Philadelphia.	3,128	15.6
Saratoga.	New York.	2,426	15.4
City of Alexandria.	New York.	2,480	15.4
Nacoochee.	Savannah.	2,680	15.4
Chattahoochee.	New York.	2,678	15.4
Roanoke.	New York.	2,354	15.4
Excelsior.	New York.	3,264	15.4
Alamo.	New York.	2,943	15.4
Lampasas.	New York.	2,943	15.4
El Paso.	New York.	3,531	15.4
El Dorado.	New York.	3,531	15.4
H. F. Dimock.	Boston.	2,625	15.4
Herman Winter.	Boston.	2,625	15.4
Seminole.	New York.	2,557	15.4
El Monte.	New York.	3,531	15.4
San Pedro.	New York.	3,119	15.4
San Pablo.	New York.	4,064	15.4
Cherokee.	New York.	2,557	15
Santa Rosa.	New York.	2,417	15

The Navy Department has thus accredited 28 American steamers of from 2400 to

4000 tons, with a sea speed of 15 knots or over, and from these vessels, should the Naval Reserve require them, selections will be made.

Losses on the Atlantic.

It is certainly a startling fact that in the space of 47 years since the unfortunate President left New York on March 11, 1841, never again to appear to mortal ken, nearly 100 fine steamers have been utterly destroyed while on their passage across the Atlantic. Of these, eight, after leaving port, mysteriously disappeared and have never since been heard of; ten were run down in collision; five were burned; one ran on sunken ice in the Straits of Belle Isle; three foundered in mid-ocean, and the remainder of the melancholy list were wrecked either on the Irish and British coasts, on those of America, or on islands or rocks off them. Fully ten of these ran in foggy weather on the shores of Nova Scotia or Newfoundland on their westward voyages, a sufficient warning, it might be supposed, to captains to give a wide berth to those latitudes. Only one, the Iowa, an American steamer, was wrecked on the French coast, near Cherbourg, in 1864. It is generally supposed that shipwrecks are caused by the rage of the elements, but of all the vessels that went ashore only three or four appear to have directly suffered in consequence of heavy weather. Miscalculations as to distances run and courses steered, clouded skies, dark nights, and more than all, dense fogs, were the primary cause of the disaster.

Comparatively few of these shipwrecks occurred without serious loss of life, at least 5600 persons having perished among the passengers and crews who were on board. When the Atlantic was wrecked on Meagher's Head, off the fatal Nova Scotian coast, in 1873, no less than 562 persons were drowned. With the City of Glasgow 480 people disappeared; with the President, 120; with the Pacific, 186; and with the City of Boston, the last of the missing steamships, 191. When the Austria was burned in mid-ocean 470 lives were lost; with the Arctic, 323; with the Anglo-Saxon, 372; with the Ville du Havre, 226; with the Borussia, 200; and with the Schiller, 311. The destruction of other vessels caused the loss of fewer lives than the vessels named, as, happily, fewer passengers were on board, but with several on the list from one to 200 beings perished. In 1873 no less than six large steamships were wrecked, run down or disappeared, the most disastrous losses being those of the Atlantic and the Ville du Havre, a total of 788 lives.—*Harpers' Weekly*.

The H. C. Frick Coke Company, of Pittsburgh, have posted notices at all their works in the Connellsville region to the effect that the wages of their employees will be advanced 5 per cent., the advance to take effect from September 1. The advance is a voluntary one and is taken as an indication that there is a decided improvement in this industry, both as regards demand and selling price.

In a lecture delivered last December before the Franklin Institute, Mr. John Birkinbine refers to a peculiar and apparently isolated deposit of Clinton fossil ore, which exists at Iron Ridge about 50 miles north of Milwaukee, Wis. The ore soon after mining breaks into grains which from their shape, size and color have given to it the name of "flaxseed ore." Another deposit of fossil ore is reported further north in Wisconsin. The Iron Ridge ore carries such proportions of phosphorus, lime and silica as to invite attention to it for use in producing steel by the basic process.

TRADE REPORT.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, September 11, 1888.

While there is no disputing that there has been an important and legitimate improvement in the general Iron and Steel business within the last 60 days, there is evidence of an intended boom on the part of speculators, who are anxious to excite the market and run it up higher, but it is not likely that they will be successful. Already the feeling begins to obtain on the part of the trade generally that the danger line has been reached; that much higher prices will stimulate importations from foreign countries, which they are anxious to avoid. It is believed that a good many sales are reported that never were made, from the fact that the prices are considerably higher than other offers are being made to sell at. This species of manipulation may do in stocks, oil or wheat, but it will not do in the Iron trade, which has always been conducted upon a legitimate basis, and is governed and controlled by the law of supply and demand.

The general position of the Iron market is fairly satisfactory; there is an increasing volume of business, but prices of the products have not as yet got up to correspond with the enhanced cost of the raw material, and there is a good deal of complaint in consequence. As it is now mill owners cannot get cost out of the finished Iron, and it is evident that either the one will have to advance or the other decline.

Pig Iron.—The market is active, sales of some 15,000 tons having been reported, in addition to a good deal of business which is not made public. As regards prices, there has been no quotable change. Consumers generally are very well stocked, as they have been buying pretty freely ever since the market began to advance, and having bought at prices much below those now current, and believing, as many of them do, that the upward turn has been arrested, it is not strange that they are now holding off. However, furnacemen are generally well sold up, some of them for the remainder of the year, but additional furnaces are being started up and production increased. Furnaces that have been idle for several years are being placed in readiness to start up—among other the old Clinton, which will be operated by a syndicate of creditors of Graff, Bennett & Co., the former owners. The market is being watched with a good deal of interest, as it is believed by many that the highest point has been reached, and as a consequence there is more disposition to sell and less to buy; however, there is no indication of anything like a collapse, nor is such a thing at all probable, but there is reason to believe that the market will settle down at present prices, which may be fairly quoted as follows:

Neutral Gray Forge.....	\$16.00 @ \$16.50,	cash
All Ore Mill.....	16.75 @ 17.00,	"
No. 1 Foundry.....	17.50 @ 18.00,	"
No. 2 Foundry.....	16.25 @ 16.75,	"
No. 3 Foundry.....	15.50 @ 16.00,	"
No. 1 Charcoal Foundry.....	23.00 @ 24.00,	"
No. 2 Charcoal Foundry.....	21.00 @ 22.00,	"
Cold Blast Charcoal.....	25.00 @ 28.00,	"
Bessemer Iron.....	18.00 @	"

There have been sales of Bessemer reported at \$18.25, cash, but your correspondent has heard of no reliable sales above \$18, cash, and some of the brokers say they are still prepared to make additional sales at the price quoted. In regard to Mill Iron, there have as yet been but few sales at \$16.50, cash.

Muck Bar.—There have been sales at \$29 @ \$29.25, cash, showing but little change on the prices of a week ago. While it is true that some sellers are holding for

\$30, and refusing to sell for less, thus far we know of no sales having been made above \$29.25, and buyers have no trouble in getting what they want at the prices quoted. It is said that there is a very fair margin for profit at present prices.

Manufactured Iron.—There is a continued fair demand for Merchant Iron, and prices are firm, although as yet they have not advanced as much as the raw material; both jobbers and large consumers, impressed with the belief that prices may go still higher, are buying pretty freely, and the mills generally are fully employed. Some mill owners are not disposed to contract for future delivery at present prices. We quote Bars at 1.80¢ @ 1.85¢, 60 days, 2 ¢ off for cash. There is an increasing demand for Skelp; those mills making a speciality of it have about all they can do; Grooved is quoted at 1.80¢ to 1.85¢, and Sheared at 2¢ @ 2.10¢.

Nails.—While trade continues dull for the season, the market is firmer, owing to increased cost of Nail Slabs, which have advanced \$1 @ \$1.50 per ton, as compared with the lowest. That the market has stiffened is evident from the fact that buyers are now willing to pay card rates, which they refused to do until within the past week. This proves that makers west of here who have been cutting, are now exacting full rates. The demand, while somewhat better, is poor for the season, and not likely to amount to much this fall; at least there is not much indication of it at present. We continue to quote at \$1.90, 60 days, 2 ¢ off for cash.

Wrought-Iron Pipe.—There is a fair degree of activity, but prices continue irregular and unsatisfactory. Some of the old mills, with a trade established years ago, are pretty well employed, but others, of recent origin, new in the business, have but little to do. Some of the latter are doing next to nothing. However, owing to enhanced cost of Pipe Iron, prices are firmer, and the very low rates of a month ago cannot now be obtained. Discounts are quoted at from 55 to 57½ ¢ on Black Butt Welded and 65 @ 67½ on Black Lap Welded; Boiler Tubes 65 ¢ off, large lots.

Old Rails.—There is still considerable inquiry and much limited offerings. The market is firm with sales of American Tees at \$24.50 @ \$25. As yet but few have been sold above \$24.75, which price was obtained for a lot delivered at Youngstown, Ohio. The great trouble with consumers was that they nearly all closed their mills on July 1st with little or no stock, and then when they started up they were on the make at once, which sent prices up faster than they otherwise would have gone. However, the stock of American is light, and foreign cannot be laid down in Pittsburgh at prices quoted. It is claimed that there is an effort being made to manipulate the market, but whether there is anything in it we cannot say.

Steel Rails.—There have been no sales reported here of late, and there does not appear to be much inquiry. However, as the railroads are generally reported as doing well it is thought there will be more miles of new roads built in 1889 than during the present, and there is a possibility of an improved demand for Rails before the close of the present year. We continue to quote heavy sections at \$30 free on cars here.

Railway Track Supplies.—Demand continues light for the season, while prices remain unchanged. Splice Bars, \$1.80 @ \$1.85; Track Bolts, \$2.85 with Square, and \$2.95 with Hexagon Nuts. There may be an improved trade before the close of the present year. The enhanced cost of

Old Rails will add largely to the cost of making Spikes, for which they are largely used, and with anything like a demand Spikes would advance.

Merchant Steel.—There is a fair business reported at unchanged prices. Best brands Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery, 5¢; Open Hearth, 2½¢.

Billets, &c.—Bessemer Steel Billets are quoted at \$29, cash, delivered on cars at maker's mill, and the same quotation will answer for Nail Slabs. Domestic Rail Crops and Bloom Ends, \$19.

Old Material.—There is an improved demand for all kinds of Old Material, and prices are firmer and higher. Sales: No. 1 Wrought Scrap, at \$21 net ton; Car Axles, \$24 @ \$25; Wrought Turnings, \$13.50 @ \$14; Cast Scrap, \$15.50 @ \$16, gross; Cast Borings, \$12 @ \$13; Car-Wheels, \$20. There is very little inquiry for Wheels in this market.

The partnership heretofore existing between Jacob P. Koehler and George A. Koehler, under the style of Koehler & Co., dealers in Scrap Iron and Metals, on Pike street, Pittsburgh, Pa., has been dissolved by the retirement of George A. Koehler. The business will be conducted under the same firm name by the remaining partner at the old location.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, September 10, 1888.

Pig Iron.—A further improvement is perceptible both as to demand and prices. Quite a considerable quantity of Lake Superior Charcoal Pig Iron has been called for by the Malleable Iron trade, showing that their requirements have not yet been filled, but they have few brands to select from. Car-Wheel manufacturers are not in the market to any extent. If they should be obliged to make purchases, as they soon may with the improving demand for cars, the price of Charcoal Pig will not long remain at its present figures. Soft Coke Irons are very firm, and the prices of some favorite brands of American Scotch have been marked up 50¢ to 75¢. Even Southern Ohio Irons feel the effects of the improving condition of the Iron trade, the large stocks held by the furnaces of that district no longer operating as a bar to an advance. Agents for these as well as for other furnaces are being instructed to leave no propositions open on orders of any size. The condition of Southern Coke furnaces is reported by recent observers, who have visited the active plants, to present very little danger of an excessive supply of Pig Iron being thrown upon the market for the remainder of this year. Prices have been advanced upon such grades as are still unsold to a point which will very probably keep them out of this market for a time, unless the price of Northern Irons is marked up correspondingly. Lake Superior Coke Irons have not advanced as much as the prices of other classes of Pig Iron would seem to warrant, but they now show indications of improvement. Cash quotations are as follows: Lake Superior Charcoal, all numbers, \$19.50 @ \$20.50; Alabama Car-Wheel, \$26.25; Southern Charcoal Foundry, No. 2, \$18.50 @ \$20; Jackson County Softeners, No. 1, \$18.25 @ \$18.75; Hocking Valley, Soft Foundry, No. 1, \$17 @ \$18; American Scotch (Blackband) No. 1, \$19 @ \$20; other Ohio Scotch Irons, No. 1, \$18 @ \$18.50; Lake Superior Coke, No. 1, \$17.50 @ \$18.50; No. 2, \$16.50 @ \$17.50; No. 3, \$15.50 @ \$16.50; Southern Coke, No. 2, \$18; No. 2½ and Open Bright, \$17.50; No. 3, \$16.50 @ \$17.

Bar Iron.—It is difficult to quote prices just now, as the mills seem to be competing with one another to see which can name the highest figure. The range during the week has extended from 1.70¢ to 1.85¢, f.o.b. Chicago, half extras, for carload lots of Common Iron. Of course the mills asking the highest prices are out of the market, but if conditions remain as they have been the cheapest sellers will soon be filled up, and the prices which seem high to day will be looked upon as quite reasonable. Figuring on the basis at which some contracts are known to have been taken in August—namely, 1.50¢, f.o.b. Chicago, and taking 1.75¢ as about the present rate, the advance has been \$5.60 per gross ton. And yet there are believers in a still greater advance, who argue that the car builders will certainly need a great deal of Iron this fall and winter, caused by a heavy increase in the consumption. A great deal of work is in sight among the miscellaneous consumers of Bars, and good business seems to be assured for some time to come. From the comments now being made by manufacturers and their agents it would not be surprising if an attempt should be made to restore the old rate of extras. Store prices range from 1.80¢ to 2.10¢ for Common Iron, with a good demand and firm tone.

Structural Iron.—A fair business has been done in this line. Prices for mill lots are now as follows, f.o.b. Chicago: Angles, 2.35¢; Universal Plates, 2.40¢; Tees, 2.65¢; Beams and Channels, 3.40¢. Store prices are as follows: Angles, 2.40¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢.

Plates, Tubes, &c.—Quite a number of orders were taken for carload lots of Plates and a very good business was done in small lots also. The mills are getting more decided in their views of higher prices, and it seems to be a mere question of time when prices will be advanced here. Some of the Tube mills have notified their agents of an advance, but the others are holding to their former figures. Quotations are unchanged, as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 % @ 65 % off on 2½-inch and larger, and 62½ % off on 2-inch and smaller.

Sheet Iron.—A few mills which had wisely refrained from filling up with orders when prices were at their lowest are profiting by the demand now being experienced. They report sales for October and November delivery at 3.10¢, f.o.b. Chicago, for No. 27, and expect to get 3.15¢ shortly. Jobbers continue to quote small lots of No. 24 at 3.30¢, Nos. 25 and 26 at 3.20¢, and No. 27 at 3.30¢, with a small concession to best buyers. They are having difficulty in getting deliveries from the mills, which seriously interferes with their trade.

Galvanized Iron.—Stocks in the Chicago warehouses are more broken than ever, in consequence of the inability of the mills to ship fast enough to keep up with sales. Prices of large lots are unchanged, but agents are looking for an advance in rates, which they think is warranted by the very encouraging condition of business in this and related branches. Quotations for small lots are as follows: Juniata, 60 and 10 % off; Charcoal, 60, 10 and 5 % off.

Merchant Steel.—An increasing business is reported in the higher grades, showing an improving consumption. Prices are unchanged, store rates being as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 84¢ @ 94¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth

Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Small sales have been made, amounting to probably less than 5000 tons in the aggregate. The North Chicago Rolling Mill Company's South Chicago mill will resume operations next week on old orders for this month's delivery. They hope to receive enough new business in addition to keep the mill in operation during the remainder of the fall months. The outlook for heavy trade is not encouraging, although next year is looked forward to with decided hopefulness. An effort is being made to get \$31 on contracts now coming up.

Old Rails and Wheels.—Several thousand tons of Old Iron Rails have been sold at prices ranging from \$24 to \$25. The higher figure now seems to be the ruling quotation, with but a light supply in sight. Old Car-Wheels are very scarce, and transactions are consequently light. A few tons have been picked up at \$18.50 @ \$18.75, but holders generally ask \$19 @ \$19.50.

Scrap.—Business has been dull during the week. The railroads are offering larger quantities than usual for sale this month, evidently to take advantage of the recent advance in prices. Dealers, however, are looking for a slight decline now, as a result of the advance in freights to Pittsburgh and Mahoning Valley points, at which much of the Scrap accumulating here is marketed. Quotations for carefully selected are as follows, per ton of 2000 lb: No. 1 Forge or Railroad Shop, \$19 @ \$19.50; Track, \$18.50; No. 1 Mill, \$15 @ \$15.50; Light Wrought, \$11; Horseshoes, \$18; Axles, \$25; Cast Machinery, \$13.50 @ \$14; Stove Plate, \$11; Cast Borings, \$9; Wrought Turnings, \$11; Axle Turnings, \$13; Coil and Leaf Steel, \$16; Locomotive Tires, \$16.50.

Hardware.—A fair demand for Heavy Hardware is noted. Wagon Stock is rather dull, but in Iron, Steel, Blacksmiths' Supplies, &c., a little more business is being done than in previous weeks. Nuts are hardening in sympathy with the advance in Bar Iron, which may also be expected to affect other Bar Iron products if it is maintained for any length of time. Shelf Hardware is moving, the demand being good from all quarters tributary to this trade center. Commercial travelers are sending in very encouraging reports of the prospect for future business, which it is predicted will assume large proportions as soon as the safety of the corn crop is assured beyond all doubt. Very little speculative buying is now being done, and it will be discouraged by the prominent houses here as much as possible should a tendency develop itself when activity in trade sets in.

Nails.—Some good sales of Steel Nails have been made by manufacturers' agents at the advanced price, but the demand is not general. The Wheeling mills are holding firmly at \$1.90 at mill for large lots, and another advance of at least 10¢ is expected. It is understood that a very important meeting of the Western Nail Association will be held at Wheeling on the 12th inst., which will result in the adoption of measures to sustain the advance. Stocks in dealers' hands here and at other points in the West are reported light. No heavy transactions in Wire Nails have come to light, but sales agents are known to have refused large orders tendered them at the prices ruling before the recent advance. They quote \$2.55, f.o.b. Chicago, as their bottom rate. Store prices are unchanged at \$2.10 for Steel and \$2.60 for Wire in small lots.

Barb Wire.—The buying movement reported last week has grown a little stronger. Manufacturers are making sales

of 50 to 100 tons to dealers in various parts of the Northwest who think this a good time to stock up, and jobbers are also meeting with some demand from their trade. Prices for small lots of Painted are quoted nominally at 3¢ and Galvanized at 3.75¢.

Pig Lead.—With but a light business in progress prices have been maintained between 4.65¢ and 4.75¢. At the close of the week 4.70¢ was bid and 4.75¢ asked.

The Laughlin Nail Company, of Wheeling, W. Va., have issued a very striking circular calling the attention of the trade to their Nails. Their weekly capacity exceeds 10,000 kegs, their factory being the second largest in the world. They make their Nails from Bessemer Steel, made specially for Nails, in their own Bessemer Steel plant. Geo. G. Spencer is salesman, at 115 Dearborn street, Chicago.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., September 11, 1888.

Pig Iron.—A very satisfactory week's business has been done in Pig Iron, and, doubtless, at somewhat better prices, taking an average of the entire market, although no quotable change can be made at present. But everything is firm, no shading whatever, but a gradual dropping out of sight of the inside quotation, and a gradual tendency to work toward the outside figures. Some fair brands of Iron may yet be picked up at \$16, \$17 and \$18, delivered at tide, for the three grades, but the brands are limited in number, and the quantity available is still more limited. But when sellers begin to talk \$16.50, \$17.50 and \$18.50 to \$19, buyers are by no means anxious to place orders. They would buy largely at the former quotations, but beyond that they restrict their orders to immediate requirements, a kind of business which is quite acceptable to sellers, as they have no wish to discount the future to any great extent. On the whole, therefore, the market may be considered as perfectly satisfactory for the present. Buyers can get all the good Iron they require by paying a very slight advance, and at that advance sellers can market about all that they can spare. This leaves the future open to any changes that may take place. If the demand continues as it has been during the past 30 days, sellers will not only require more money for their product, but will get more money for it in a little while. Consumers will make no objection to a further advance, if they meet with a corresponding demand for their products, without which it would be impossible to inaugurate a successful movement of that kind. As to the probabilities, opinions are somewhat divided. A large business is believed to be assured, but it is doubtful if prices can be increased to even a very moderate extent without inviting a competition which would soon upset things again. There is not enough business on hand or in sight to warrant very hopeful expectations on this point. At a \$1 per ton advance in Pig Iron, and \$2 or \$3 in Finished Iron, production would be greatly stimulated. A good general demand appears to be all that can be hoped for, and this can be easily met by mills and furnaces already in operation. Some time ago they were not running nearly full, while stocks of Pig Iron were accumulating at furnaces. The little turn that everybody was looking for has come, and things are moving nicely, but it may be altogether a mistake to assume that more furnaces and more mills can find a market for their output at advancing prices. All these things are, of course, within the range of possibilities, but for the present they are not regarded as probabilities, hence as this article remarked

last week Philadelphia is inclined to follow rather than lead in the matter of advancing either Pig or Finished Iron.

Foreign Iron.—Buyers are in the market at low prices, but there is not much probability of business being closed. Bids of \$18, c.i.f., duty paid, are being made for 10,000-ton lots, against \$20 asked.

Blooms.—There is a good demand at full prices, but sellers have not been able to establish any advance. Sales chiefly within the following range of prices: Nail Slabs, \$28.50 @ \$29.50; Billets from \$30 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 $\frac{3}{4}$ "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29 @ \$30 for Nail Slabs; \$31.50 @ \$32.50 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—There has been a very active demand, under which prices were advanced to \$29, Philadelphia, at which figures several lots were taken. Bids of \$28.50 are made for large lots, but the supply is limited, and \$29 a firm quotation.

Bar Iron.—The demand for Bars keeps up remarkably well, and buyers find prices gradually stiffening up. It is difficult to define the exact position, beyond saying that prices are slightly higher. Some mills talk 1.9¢ firm, others 1.85¢, while some would not be likely to refuse a desirable order at 1.8¢ or 1.82 $\frac{1}{2}$ ¢. All depends on circumstances. Those that are full would quote the higher figure firmly, while those less favorably situated might accept the lower figure, so as to get some work ahead. Then the question of quality comes in, so that it is impossible to fix any definite figure and call it a firm price, but it is quite safe to say that an average advance of half a tenth has been made on everything, and is likely to be maintained. Skelp Iron continues to be in active demand, with sales at 1.82 $\frac{1}{2}$ ¢ @ 1.85¢ for Grooved, and 1.95¢ @ 2¢ for Sheared. At the inside figures large orders are still on the market, but mills are pretty well filled up, and a further advance is being contended for.

Plate and Tank Iron.—A moderately large business has been closed during the week, and while sellers generally are asking more money, and getting it possibly in some cases, it would not be quite true to say that prices are higher. There is an impression that prices will be higher, and the outlook seems to warrant that opinion. The general demand is very good, while the shipbuilding interests seem likely to become large consumers during the next 12 months. Government work will be actively prosecuted, and there is reason to believe that a number of private firms will order additions to their respective fleets. In fact, shipbuilding is likely to be carried on during 1888 and 1889 on a larger scale than ever before. The following indicates some of the work which is under consideration: A number of large steamships for service to Australia will be built for Claus Spreckels, whose representative is now on his way to this city. Several large tugs, to be used at San Francisco, will also be constructed by the Delaware River shipbuilders. The Ocean Steamship Company, of Savannah, are about contracting for two steel passenger steamships for the coastwise trade between Philadelphia, New York and Savannah. The Standard Oil Company are contemplating the construction of a new bulk oil carrying steamer for the coastwise trade, and Boulter, Bliss & Dallett, who have sold two of their vessels, are on the lookout for others. The firm now has a vessel on the stocks in Cramps' yard. The Clydes are contemplating a new steamship service in the West Indies,

probably to Hayti and the Windward Islands, and want several first-class vessels. It is said that within a few months the Delaware River shipbuilders will have enough orders on hand to keep them busy for two years, but there are no Transatlantic steamers included in the list. Prices about as follows: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3 $\frac{1}{2}$ ¢; Fire-Box, 3 $\frac{1}{2}$ ¢ @ 4 $\frac{1}{2}$ ¢.

Structural Iron.—Business in this department has not shown as much activity as in some others, although the Shape mills will doubtless fall into line soon. Work on old contracts is being actively called for and prices are rather firmer. Prospects moderately encouraging, but nothing specially important in sight at present. Prices as follows: 2.10¢ @ 2.15¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel

Sheet Iron.—There is a very active demand for specialties, but in other directions there is not much improvement, although stocks are not accumulating to any extent. Good makes in small lots command about the following quotations:

Best Refined, Nos. 26, 27 and 28....3 $\frac{1}{4}$ ¢ @ 3 $\frac{1}{2}$ ¢
Best Refined, Nos. 18 to 25.....3¢ @ 3 $\frac{1}{4}$ ¢
Common, $\frac{1}{4}$ ¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28....4 $\frac{1}{4}$ ¢ @ 4 $\frac{3}{4}$ ¢
Best Bloom Sheets, Nos. 22 to 25....4¢ @ 4 $\frac{1}{4}$ ¢
Best Bloom Sheets, Nos. 16 to 21....3 $\frac{3}{4}$ ¢ @ 3 $\frac{1}{2}$ ¢
Blue Annealed.....2.8¢ @ 3¢
Best Bloom, Galvanized, discount.....62 $\frac{1}{2}$ ¢
Common, discount.....67 $\frac{1}{2}$ ¢

Merchant Steel.—No change to report. A fair business is being transacted and prices are quite satisfactory. Small lots from store are quoted as follows: Tool Steel, 8 $\frac{1}{2}$ ¢; Machinery, 2.6¢; Crucible Spring, 4 $\frac{1}{2}$ ¢; Open-Hearth Ordinary Spring, 2.7¢ @ 2.9¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—There is not much change in this department, and on the whole business is rather disappointing. Sales of small lots are reported at \$29.25 @ \$29.50 at mill, but good-sized orders could be placed at \$29, possibly a shade less if very desirable as to quantity, time of delivery, terms of payment, &c.

Old Rails.—There is an urgent demand, but in the absence of offerings it is impossible to say what the market is. Bids of \$23 for T's were made to-day without bringing any response from holders, so that we quote \$23 nominal.

Scrap Iron.—Under a heavy demand prices are again dearer, with sales at about the following figures: \$20.50 @ \$21 for cargo lots; \$21.50 @ \$22 for carload lots, delivered, or for choice \$22.50 @ \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$19 @ \$20; Cast Scrap, \$14 @ \$15; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought Iron Pipe.—There is nothing specially new to note in this department. Orders are coming in very rapidly, and prices show more firmness than for some time past. Discounts are quoted as follows: Black Butt-Welded, 55 ¢; on Galvanized do., 45 ¢; on Black Lap-Welded, 65 ¢; on Galvanized do., 52 $\frac{1}{2}$ ¢; on Boiler Tubes, 60 ¢.

Nails.—The general improvement noted last week continues. Prices are firmly held, and the general outlook is fairly promising. Lots from store are quoted at \$2, with the usual discounts on carload lots.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, September 10, 1888.

During the past two weeks there has been considerable apprehension that the continuous, and at times heavy, rains would seriously affect the crops of cotton and corn, especially the former; but so far as heard from, the crop is not sufficiently advanced to be much affected. Should the weather become clearer soon there will be no serious damage done and the year will close with one of the largest crops that has ever been raised in the South.

Pig Iron.—Beyond a gradual stiffening-up in prices and increased difficulty in making purchases, there appears to be nothing particular to note in the movements of this article. Furnaces that are not sold up to their entire capacity report no trouble in realizing from \$1 to \$2 more for their output than they did in June and July, and there is considerable anxiety manifested by some consumers in not being able to get contracts for future delivery at present prices, and instances are not wanting that for round lots for time deliveries present prices would be raised, but furnaces are disinclined to commit themselves to contracts to be filled excepting in the near future. Everybody appears to be looking for still higher prices during the present year.

Cincinnati.

CINCINNATI, September 10, 1888.

Pig Iron.—Individual sales of Pig Iron during the past week have been large, although the aggregate volume of business probably has not been much, if any, larger than that of several preceding weeks. A large proportion of the transactions have necessarily been for future delivery, the furnaces being so largely and heavily sold. A very strong tone has prevailed, but no further advance in prices is recorded, many furnaces and their agents deprecating higher prices, on the ground that any further advance will soon lead to increased cost of production by an advance in the price of Ore, Coke, &c., if not labor. At the same time, many furnaces, apparently, wish to encourage the belief in higher prices by not withdrawing decidedly from the market, but pricing their output at such figures as they think may discourage consumers temporarily, and at the same time may keep a buyer in view. The sales of the week have embraced the entire lots of Northern and Southern Irons obtainable, but probably more largely of Southern Ohio Forge Iron, one transaction noted being about 6000 tons for delivery extending through the remainder of the year; 1000 tons Southern Car-Wheel Iron was sold at \$25, four months' time, and several lots of 1000 tons and more of both Forge and Foundry at the range of prices quoted last week. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$17.50 @	\$18.50
Southern Coke, No. 2.....	16.50 @	17.50
Southern Coke, No. 3.....	15.50 @	16.00
Ohio Soft Stone Coal, No. 1.....	17.00 @	17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @	16.00
Mahoning and Shenango Valley ..	17.50 @	18.50
Hanging Rock Charcoal, No. 1....	20.50 @	22.50
Hanging Rock Charcoal, No. 2....	19.50 @	22.00
Tennessee and Alabama Charcoal,		
No. 1.....	18.50 @	19.50
Tennessee and Alabama Charcoal,		
No. 2.....	17.00 @	18.00

Forge.

Strong Neutral Coke.....	14.75 @	15.00
Mottled Neutral Coke.....	13.50 @	13.75
No. 1. Mill Coke.....	15.00 @	15.25
No. 2 Mill Coke.....	14.50 @	14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @	23.00
Hanging Rock, Cold Blast.....	22.00 @	25.00
Lake Superior Car-Wheel and Mal-		
leable.....	20.50 @	21.50

Manufactured Iron.—There has been a fair volume of business and a stronger feeling in sympathy with the strong market for Pig Iron, but prices are without change of importance. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3½¢ @ 4½¢ @ lb.

Nails.—There has been a moderate demand and a steady market, but the supply is liberal of most sizes. Jobbing prices are based upon 12d @ 40d, which sell at \$2 @ keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2 and Steel Wire Nails at \$2.65 @ \$2.75 @ keg

Detroit.

WILLIAM F. JARVIS & Co., under date of September 10, report as follows: The market continues active and very strong. Several large sales of Lake Superior Charcoal have been made during the week at from 50¢ to \$1 @ ton higher than ruling prices in July and August. The majority of the Mahoning Valley furnaces are refusing orders unless at \$1 @ ton advance, and some are not in position to fill orders promptly even if price is satisfactory. Silvery Irons have been the slowest in putting up their prices, but they too have finally decided to ask an advance of 50¢ @ ton. The fact that several parties have been seeking Iron for speculative purposes and made some few purchases, has strengthened the market, and very little, if any, Iron is now to be found at less than regular prices. With a strong market we quote as follows:

Lake Superior Charcoal, all numbers	\$20.00 @ \$20.50
Lake Superior Coke, all ore	19.75 @ 20.25
Lake Superior Coke, cinder mixed	18.50 @ 19.00
Standard Ohio Black Band	19.75 @ 20.25
Southern No. 2	17.75 @ 18.25
Southern Silvery	17.00 @ 17.50
Southern Gray Forge	18.25 @ 18.75
Jackson County (Ohio) Silvery	18.50 @ 19.00
Old Wheels	20.00 @ 20.50

Cleveland.

CLEVELAND, September 10, 1888.

Iron Ore.—If the mine owners could be guaranteed a sufficient advance in the price of ore to cover the increased cost of lake transportation, arrangements would undoubtedly be made for a heavier output than is now contemplated. The demand for ore unquestionably warrants an increase in mining operations, but quotations do not keep pace with the demand. Furnacemen seem disinclined to pay much more money for ore than has been paid for the bulk of their season's purchases. A number of buyers are known to have declined offers for ore with full cost of lake freights included. The efforts of the mine owners seem to be directed just at present to an effort to keep pace with the advancing lake freights. But while the cost of transportation is about 50 ¢ @ ton greater than at the beginning of the season, quotations for ore have advanced only from 20¢ to 40¢ @ ton, a very few high grade ores having increased in value 50¢ @ ton. Scattering sales of Gogebic Bessemer at \$3.25 are reported, and additional transactions in No. 1 Specular and Magnetic ores at \$6.25 have occurred. The lake shipments to date are slightly in excess of 2,900,000 tons. Up to a corresponding period last year 3,150,000 tons had been shipped.

Pig Iron.—The demand for all brands of Pig Iron continues in excess of the production. Prices have also improved, Foundry and Bessemer Irons being especially strong. Mill Irons are quoted at an advance, the inquiry even at the higher figures being quite heavy. Sales of Mill Iron at \$16, of No. 1 Foundry at \$17.50, and No. 2 Foundry at \$16.75 are reported.

Manufactured Iron.—Bar Iron in round lots brings \$1.65, a sale of 1200 tons at that figure having occurred during the week.

Sheets.—No. 24 is now quoted at \$2.85. Common Sheets are hard to obtain and cannot be purchased for delivery within 30 days.

Scrap Iron.—Old American Rails have suddenly advanced to \$25 per ton, at which figures they are firmly held. Wrought Scrap is eagerly taken at \$19 @ \$19.50.

Louisville.

LOUISVILLE, KY., September 10, 1888.

Pig Iron.—Business during the past week has been fair, and buyers have been compelled to pay market prices, furnaces not finding it necessary to make concessions at all. There is a feeling among buyers that the coming week will decide whether the market is to decline or another advance be made, and that the position of the Eastern market will largely decide this. Furnaces consider this question already settled, as they report an advance as having already taken place in that section, and that Iron cannot be sold East that will net them more money than the West offers. If this improvement is permanent buyers here will find it to their interest to make purchases at once, as indications point to a slight advance in the immediate future.

Southern Coke, No. 1 Foundry	\$17.00 @ \$18.00
" No. 2 "	16.00 @ 16.50
" No. 2½ "	15.50 @ 16.00
Hanging Rock Coke, No. 1 Foundry	17.25 @ 17.75
Hanging Rock Charcoal, No. 1 Foundry	21.00 @ 23.25
Southern Charcoal, No. 1 Foundry	18.00 @ 18.50
Silver Gray, different grades	14.50 @ 15.25
Southern Coke, No. 1 Mill, Neutral	14.75 @ 15.25
" No. 2 "	13.75 @ 14.75
" No. 1 " Cold Short	14.25 @ 14.75
" Charcoal, No. 1 Mill	15.75 @ 16.50
White and Mottled, different grades	13.50 @ 13.75
Southern Car-Wheel, standard brands	23.00 @ 24.00
Southern Car-Wheel, other brands	19.25 @ 21.25
Hanging Rock, Cold Blast	22.25 @ 25.25
Hanging Rock, Warm Blast	19.25 @ 20.25

Old Rails.—are stronger, sales having been made at \$23 and \$23.25, f.o.b. cars Louisville, and offers on basis of these figures have been made for large amounts to be delivered during the remainder of the year.

New York.

Office of The Iron Age, 66 and 68 Duane street. NEW YORK, September 12, 1888.

American Pig.—The feeling among producers and dealers is growing more and more hopeful, and some sellers claim to be getting an advance of about 50¢ a ton, especially on choice No. 1 Foundry Irons. Still, the Thomas Iron Company are selling quite freely at the old figures, Mr. B. G. Clarke reporting sales in blocks of 1000 and 2000 tons, or 8000 tons during the week. He estimates that of this year's probable output of the company about 20,000 tons still remain unsold. Comparatively little is heard of Southern Irons, representatives of producers here stating that their principals are doing better in the West. From that quarter, however, come reports that the Eastern market is relatively the most favorable to Southern furnacemen. These conflicting claims have been the subject of some comment in the trade of late, though they are by no means a new feature. In Mill Irons New York has long ceased to be a market of any consequence, but it is a feature worthy of note that inquiries for a 1000-ton lot have come here from Pittsburgh during the past week. We quote standard Northern No. 1 Foundry, \$18 @ \$19, the latter for choice quality; No. 2, \$17 @ \$17.50, and Gray Forge, \$15.75 @ \$16.25. Our monthly furnace report, published elsewhere, shows little change among the

Anthracite furnaces, but an increase in the Coke furnace capacity of about 6000 tons weekly.

Scotch Iron.—There has been a continuance of the advance, due chiefly to a rise from 4/ to 10/ in steamer freights, which, it is surmised, is due to an agreement between the two lines. On the rise importers have sold freely, and they are asking for Coltness from \$21 to \$22, Shotts, \$20 to \$20.50, Langloan and Dalmellington, \$19.75 to \$20, it being claimed by some that the lower figures named do not cover cost of importation. It remains to be seen to what extent these prices will curtail consumption. Founders in the West have long learned to get along without foreign Scotch, and it would appear that the time has arrived when even those in the East most persistently clinging to time honored mixtures should make efforts to make themselves independent of foreign Iron.

Structural Iron.—The trade is moderately active and the outlook is regarded as flourishing, but as yet no quotable advances have taken place. We quote for round lots, on dock: Sheared Plates, 2¢ @ 2.10¢; Universal Mill Plates, 2.1¢ @ 2.15¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.7¢ and Channels and Beams, 3.3¢.

Plates.—A moderate amount of business is reported, with a firmer feeling prevailing, Western sellers, particularly, dwelling upon the advance in Raw Materials. We quote for round lots, on dock: Iron Tank, 2¢ @ 2.10¢; Shell, 2.25¢ @ 2.4¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.65¢ @ 3¢, and Fire-Box, 3.5¢ @ 4¢. Galvanized Sheets are 65 ¢ @ 65 and 5 ¢.

Steel Rails.—The only sale of any magnitude reported by Eastern mills is a lot of 8000 tons to a Southern road, at private terms. The condition of the market remains practically what it has been for some time past, and no movement of winter work has yet taken place. The sales by all the mills during August are reported to have aggregated about 72,000 tons, bringing the total to September 1st up to about 1,060,000 tons, and leaving about 200,000 tons of the allotment still to be sold, while the deliveries up to September 1st were about 824,000 tons. It is worthy of note that reports from England indicate that the old International Rail Association has now been revived. This practically means that the English, French, German and Belgian mills have parceled out the world's markets with the exception of our own. Representatives of foreign mills in this country profess that they are not yet advised of the conclusion of the negotiations, which, it is well known, have been pending for some time. The fact may be recalled in this connection that one of the severest blows the old syndicate suffered was the capture of a Canadian order by an American mill at a time when domestic competition had driven prices in this country to their lowest point. We continue to quote \$28.50 @ \$29 at Eastern mill.

Wire Rods.—What inquiries are in the market are claimed by importers to be coupled with prices which they cannot think of accepting, especially in view of the rise in freights, which are quoted 10/6 @ 11/. This more than neutralizes the lowering of the foreign prices, which are on the basis of 103/ @ 104/, f.o.b. shipping ports, 97 marks dutiable value. We quote \$39.50 @ \$39.75

Old Rails.—Orders for Old Rails, both for consumers and on speculative account, are numerous but cannot be filled, since holders ask prices which buyers have not yet approached. They ask \$24 @ \$24.50 for Tees and \$24.50 @ \$25 for Double Heads, and even at these figures they are not offered firm. For shipment \$25 is the

best that can be done, inquiries sent abroad for a 2000-ton lot not even having met with a response. It is reported that \$25 has been bid for 2000 tons Tees delivered West, and has been declined. The New Haven Railroad is asking for bids on a lot of 1000 tons of Tees, delivered at New Haven or Bridgeport, the bids to be opened on the 15th inst.

Scrap.—During the past two weeks an active business has been done and the bulk of the stock in the smaller yards has been exhausted at prices ranging from \$18.50 to \$19. Since then a lot of 500 tons has been sold at private terms, and an order for 600 tons is now in the market. The larger yards ask from \$20 to \$21 now.

Fastenings.—The market is fairly active and firm with Spikes selling at \$2.15 @ \$2.20, and Angles at 2¢ @ 2.05¢. The Ames works at Jersey City are to be started again. Dilworth, Porter & Co. are still idle.

Axles.—We quote 2.15¢ @ 2.30¢ for Scrap Axles and 2.4¢ @ 2.5¢ for Muck Bar Axles.

Coal Market.

The Anthracite Coal market is quiet compared with the high-pressure times that preceded the recent advance. Nevertheless a large business is in progress, and the means of transportation are taxed to their full limit in forwarding Coal from the mines and in filling orders received previous to September 1. There is not the same eagerness manifested in placing orders at the new schedule rates, and it is not expected that the business of the present month will be equal in volume to that of August, which is already recognized as the banner month in the history of the trade, but it is possible that cold weather will act as a healthy stimulus. Prices, it is claimed, are held with little or no concession, some of the companies being already pledged for an amount of Coal equal to their entire production for the rest of the month, and therefore decline to assume new obligations. Fortunately for manufacturers the small steam sizes are in excessive supply, and buyers are in a position to dictate their own terms. New York prices are as follows:

	Broken.	Egg.	Stove.	C'nut.
Hard white ash ..	\$4.15	\$4.40	\$4.65	\$4.55
Free white ash....	3.95	4.30	4.65	4.55

Production at the mines is again on the ascending scale, the total for the week ending September 8 being 881,802 tons, a figure rarely surpassed. Compared with the previous week this is a gain of 37,000 tons, and, compared with the corresponding week last year, 153,000 tons. The gain is almost entirely from the Lehigh region. Since January 1 the aggregate is 24,858,891 tons, an increase of nearly 1,500,000 tons, compared with 1887. The Philadelphia *Inquirer* says the total for 1888 will be about 36,000,000 tons, or more than double the output ten years ago: The output for several weeks past is as follows:

	Tons.
Week ended August 4.....	754,883
Week ended August 11.....	831,615
Week ended August 18.....	920,922
Week ended August 25.....	832,058
Week ended September 1.....	844,665
Week ended September 8.....	881,802

The Reading's Monitor Colliery was seriously damaged last week by an explosion, and a serious mine fire broke out in one of Pardee Brothers' collieries, near Hazleton. The New York, Ontario and Western Railroad is about to connect the Coal mines at Carbondale with its line at Hancock, and it is said that the Delaware and Hudson Canal Company alone will send 750,000 tons of Coal annually over the road.

The Bituminous Coal trade is fairly active and prices are sometimes cut as a

consequence of free receipts. Shipments from the Cumberland region for the week were 76,776 tons, and since January 1, 2,341,339 tons, an increase of about 250,000 tons, compared with 1887.

Financial.

Advices from all quarters indicate a steady improvement in all the conditions affecting trade, and an active movement in the distribution of merchandise has fairly commenced. The speculative markets are unusually sensitive and almost without exception are higher. Wheat, cotton, sugar, lard and coffee are all up. Petroleum is strengthened by the formation of a pool to control production. Sluggishness in provisions is attributed to restricted markets, caused by yellow fever in the South. Local jobbers in the grocery trade notice an excellent demand from interior points, and the dry goods jobbing trade report a large business in progress, here and throughout the country, characteristic of what may prove to be the banner week. Of trade in the West a Chicago contemporary says the recent marked improvement is fully sustained and confidence in the future is unabated. Another says: "The summer has closed with the preponderating influences more favorable to commercial prosperity than at any time since the close of May. Tendencies, indications and prospects are construed by thoughtful, intelligent business men to mean prosperity." The unusually large corn crop, much of which is already being harvested, is generally recognized as the basis of the confident tone prevailing in trading circles. The railroads, it is predicted, will have their carrying capacity fully taxed during the next few months, but the fierce rivalry of competing lines may prevent their taking full advantage of an opportunity to increase their revenues. East of Chicago the lines, it is believed, have no ability to maintain uniform rates.

The Stock Exchange markets have been active and irregular, but generally firm. On Thursday it appeared that the three weeks' rise in prices had come to a halt, but on Friday there was a rally on the report that differences between the shippers and the Iowa companies would be arranged. On Saturday there was another upward movement, the closing sales showing considerable gains during the week. The bank statement caused a slight sensation. On Monday there were rumors from the West of further interference with established rate tariffs by State commissioners, and the decreased earnings of the Atchison road had some effect. Coal stocks reached the highest point of the year, Lackawanna the highest in six years.

United States bonds are quoted as follows:

U. S. 4½s, 1891, registered	109¾
U. S. 4½s, 1891, coupon.....	109¾
U. S. 4s, 1907, registered	129¾
U. S. 4s, 1907, coupon.....	129¾
U. S. currency 6s.....	121

The weekly bank statement reflected the large drafts upon their funds in moving the Western crops, their reserves showing a loss of \$4,920,500. The surplus now stands at \$11,846,425, which is still much larger than at the same time last year. Loans increased \$1,008,200, specie decreased \$3,941,700, legal tenders decreased \$2,168,900, and deposits decreased \$4,760,400, and there was a slight hardening in the rates for money. Time loans were made chiefly by out of town institutions at 3 @ 3½ % on collaterals for three months, and 4 @ 5 % for longer dates. The failures of the week include the old firm Charles Vogt & Co., importers of china and glassware.

The Secretary of the Treasury purchased \$4,000,000 of the registered 4 % at 129, and \$2,150,000 of the 4½ % at 106¾. These are

prices fully ¼¢ above the market prices of the previous week. Since April 21 there have been purchased of 4 % \$27,273,250, and of 4½ % \$12,744,300; total \$40,017,550. Although a contraction of \$27,700,000 has occurred during the past 12 months in the national bank note circulation, only \$11,800,000 of this amount has been due to the withdrawal of bonds deposited with the Treasury as security, showing that the banks reluctantly part with their bonds.

Sterling exchange is dull and steady at \$4.85½ @ \$4.88½.

The Government crop report was an important factor in the speculative markets and was immediately felt. Winter wheat turns out rather better than had been expected, and spring wheat somewhat worse. The percentage for the whole crop is 77.3, which the most careful estimate as representing 413,000,000 bushels, against 418,000,000 bushels last month. Spot wheat and spot corn dropped about ¼¢ @ ½¢, and new crop grades of flour were 5¢ @ 10¢ per barrel lower than on Saturday. Wheat was again off on Tuesday 1½ @ 2¢. The report made the average of cotton 83.8, a condition more favorable than was expected, and spots were firm at 1½¢ advance. Corn was stronger on an unusually good export demand. Wheat exports are restricted by lack of cargo space and the recent extraordinary advance in ocean rates, equal to 10¢ @ 11¢ per bushel.

The imports and exports at New York for August alike show a falling-off compared with last year. The former amounts to \$35,736,829 or \$8,500,000 less in merchandise and \$5,500,000 less in specie than for the month of August last year. The exports for the month amounted to \$26,127,098 or \$3,603,239 less than during August last year. High rates for ocean tonnage and enhanced cost of the leading export staples account in part for the difference. For eight months the exports exclusive of specie amount to \$192,912,000, a decline of nearly \$11,000,000 compared with the same time in 1887. Owing to the lessened imports the unfavorable balance of trade for the entire country reported for the first seven months—viz., \$55,500,000—will be reduced several millions by the August statements.

According to the Custom House report the exports of specie from this port for the week amounted to \$211,000, and the imports were \$171,000. Since January 1 the totals are \$27,146,000 and \$6,000,000 respectively. The imports of merchandise at this port during the week amounted to \$7,816,000, of which \$2,500,000 represents dry goods, and the aggregate since January 1 is \$324,288,000, as compared with \$325,958,000 for the same time last year and \$302,011,000 in 1886.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from August 31 to September 6, inclusive, and from January 1 to September 6, inclusive, were as follows:

Metal Market.

Copper.—While spot Chili Bars have been active in London during the week, advancing from £95 to £105 in consequence of the covering of shorts, but receding this morning to £95, futures have remained unaltered at £79; good merchantable brands gave way from £76. 10/ to £76. 5/, and Best Selected is now £79. 10/. The total sales, 700 tons. Here, 100,000 lb were sold at 17¢ @ 17½¢, September; 16.85¢, November, and 16.95¢, @ 17.10¢; December. A cable message from Paris states that M. Secrétan merely wanted to give the bears a lesson and that he prefers to see the price of Chili Bars £80 @ £85, so as to encourage consumption. It is also reasserted that he contemplates the extension of contracts with Spanish producers for six years. About an extension with our mines nothing is mentioned so far. From Boston it is intimated that another sale to our manufacturers may take place a couple of weeks from now. The Boston Transcript figures the total product of the eight largest Lake Superior Copper mines for August at 4826 tons of mineral, against 2758 tons for the same month last year, and the total product for eight months this year at 32,945 tons, against 30,301 tons last year. It adds: This product for eight months is equal to fully 51,500,000 lb of Fine Copper, on which the net profit over all expenses must have been \$3,250,000. Import of Copper into Liverpool and South Wales during the first eight months, 18,014 tons Fine, against 7512 last year. Export of Pyrites from Spain during the first six months, 418,720 tons, against 403,061 last year and 358,386 in 1886; of Precipitate, 13,541, against 13,745 and 13,396. Rio Tinto rose 21 francs in Paris last week. Spot Copper closes in New York at 17¢ @ 17½¢ to-day.

Tin.—Spot Tin rose in London since our last report from £98 to £104, and gave away again this morning to £103. 10/, while futures advanced from £98. 15/ to £104. 10/, to recede to £104 this morning, sales, 1300 tons. This advance, being altogether speculative, has met with but little response here, as it is believed it will prove evanescent, and sales were restricted to 10 tons spot at 22.35¢; 105 tons October at 22¢ @ 22.65¢; 25 tons ditto at 22.90¢ and 10 tons September at 23¢, the spot price to-day being 23¢ @ 23½¢. Shipments from the Straits Settlements to the United States during the first six months have been 13,377 piculs, against 43,075 in 1887, 31,533 in 1886, 16,051 in 1885, 26,651 in 1884 and 52,480 in 1883. **Tin Plates.**—Have been more active and firmer on the spot, the scarcity in Coke Tins continuing, whereas Ternese are comparatively plentiful. Futures are in request and from 5¢ to 10¢ @ box higher. Liverpool has advanced with Cokes from 13/6 to 14/. We quote toward the close, large lines, @ box, on the spot: Siemens-Martin Steel, Charcoal finish, \$4.85 @ \$5.25; Coke finish, \$4.75; Ternese, \$4.30 @ \$4.40; Bessemer Cokes, \$4.60 @ \$4.65, and Wasters, \$4.20 @ \$4.25.

Lead.—On the Metal Exchange 894 tons of Lead were sold since our last report, all the way to 5.02½¢, but nothing transpired in the way of sales to consumers, who keep aloof as heretofore, not feeling disposed or compelled to operate while this speculative purchasing continues. The chief operator is said to hold 15,000 tons at present. The closing spot price for Common Domestic to-day is 5¢; at St. Louis the price is firm at 4.80¢ @ 4.55¢. The London quotation for Soft Spanish remains £14. 2/6, and for English Pig it is £14. 5/. Spanish exportation of Lead during the first six months has been 65,040 tons, against 66,349 tons last year and 54,779 tons in 1886.

Spelter.—Ore continues advancing in the West, where Best Blende was worth last week \$29 ¾ ton, and will be raised to \$30 this week. The price here for Common Domestic is now 5½¢ @ 5¼¢, with little doing, and Silesian cannot be laid down for less than 5.80¢, since it improved in London to £18. 10/. The outlook both here and in Europe is a remarkably strong one. Spanish exportation of Calamine the first six months has been 16,601 tons, against 17,684 last year and 18,217 in 1886.

Antimony.—Has been only moderately active at 13¢ Cookson and 9½¢ Hallett; the latter is £38 in London.

New York Metal Exchange.

The following sales are reported:

THURSDAY, September 6.	
16 tons Lead, October.	4.97½¢

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]
LONDON, WEDNESDAY, Sept. 12, 1888.

There have been no really new developments in the market for Chili Bars or other Copper. Cash warrants are still kept at an extravagant point for the purpose apparently of squeezing the "shorts," but consumers can purchase supplies as cheaply now as they could a fortnight ago, and futures are no higher than last week, despite the further rise of £10 on prompts. Supplies are constantly increasing under heavy deliveries by the mining companies and the movement into the channels of consumption is very much restricted. The August deliveries to consumers were the smallest for any month in several years, and purchases at the present time are running light. G. M. B. contracts are still given good support by the syndicate, but do not appear to be traded in as freely as heretofore.

The speculative activity in Block Tin has been more prominent this week than last, and seems to be governed by the same influences that forced prices up previously. Shipments from the Straits are considerably heavier than for some time past, but neither that fact nor the probability of cost checking the consumption has any perceptible influence upon the operators for a rise. The advance for the week is about £6.

Tin Plate makers are more disinclined now than formerly to book orders except at higher prices, in view of the condition of the market for crude materials and Block Tin. The principal makers have

orders on their books that will keep them busy for some time to come. The Tynewydd Works, Pontnewydd, operating two mills, and formerly owned by E. Stanford & Co., have changed hands. The stock of Plates at all British shipping ports is 199,000 boxes, against 118,000 boxes a year ago. The British Board of Trade returns show total exports to the United States last month of 28,500 tons, against 27,450 tons in July.

The market for Scotch warrants and for makers' brands continues very strong. The latter derive no inconsiderable support from continued improvement in the sales to consumers, and the latter fact, coupled with covering of oversold account, has served to move warrants still higher. Stimulated by the active business, makers are putting more furnaces into blast. The upward movement of ocean freight rates, it is feared, will have an unfavorable influence upon export trade. It is stated that the numerous American orders at hand last week could not be filled, owing to the advance of prices of Iron and rates of freight. The exports of Pig Iron to the United States during August were only 10,000 tons, against 36,000 tons last year. The total is about the same as that for July.

There is a fairly active demand for Steel Rails, and prices continue to harden in view of the heavy orders booked latterly and the condition of the market for crude materials. The reports of an alleged combination being formed to sell at fixed rates are denied.

The demand for Old Iron Rails has further increased the past week and prices continue to harden, but show no further positive advance.

Scotch Pig.—The market continues strong and active, with a further advance in some brands:

No. 1 Coltness, f.o.b. Glasgow	50/
No. 1 Summerlee, " "	51/
No. 1 Gartsherrie, " "	47/6
No. 1 Langloan, " "	47/6
No. 1 Carnbroe, " "	43/6
No. 1 Shotts, " at Leith	47/6
No. 1 Glengarnock, " Ardrossan	45/3
No. 1 Dalmeilington, " "	43/
No. 1 Eglinton, " "	42/
Steamer freights, Glasgow to New York, 10/	
Liverpool to New York, 10/.	

Cleveland Pig.—Trade has continued active, and prices are again higher. No. 1 Middlesboro', G.M.B., 37/6 @ 38/; No. 3 do., 35/ @ 35/6.

Bessemer Pig.—The market strong at last week's advance and quite active. West Coast brands, mixed numbers, 45/6, f.o.b. shipping point.

Spiegeleisen.—Demand is running light. Prices barely steady. English 20% quoted 75/, f.o.b. N. W. England shipping point.

Steel Rails.—There has been a larger business at firm prices. Standard sections quoted at £3. 18/9, f.o.b. at N. W. England shipping point.

Steel Blooms.—The demand very fair and prices steady. We quote £3.15/ for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—A moderately active business in these at firm prices. Bessemer, 2½ x 2½ inch, £4, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—The demand slow but prices held steady. Mild Steel No. 6 quoted at £5. 18/9 and No. 5 at £5. 25/, f.o.b. at N. W. England shipping point.

Steel Slabs.—Very little doing and prices nominal. Bessemer, £3. 17/6, f.o.b. at N. W. England shipping point.

Old Rails.—Market very firm with demand good. Tees quoted at £2. 17/6, and Double Heads £3, free on board.

Scrap Iron.—There is a fair business at steady prices. Heavy Wrought quoted at £2. 5/, f.o.b.

Crop Ends.—Sales fair at previous prices. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—Makers asking higher prices and offer sparingly. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/ @ 15/6
IC Bessemer steel, Coke finish	13/9 @ 14/
IC Siemens	14/ @ 14/3
IC Coke, B. V. grade	13/6 @ 13/9
Charcoal Terne, Dean grade	13/3 @ 13/6

Manufactured Iron.—Business continues active at firm prices. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	2 s. d.	2 s. d.
Common	7 12 6	5 0 0
" B'l'k Sheet, singles	6 15 0	6 15 0
Welsh Bars (f.o.b. Wales)	4 12 6	4 15 0

Tin.—A large business done, and the market strong. Straits quoted at £103. 10/ @ £104, spot, and £104 @ 104. 10/ for three months' futures.

Copper.—Spot Chili Bars irregular. Otherwise market firm, but quiet.. Chili Bars, £95 @ £100, spot, and £79 three months' futures. Best Selected, £79.

Lead.—There has been a good business, and the market is strong. Soft Spanish, £14. 2/6.

Spelter.—Prices again higher and the market strong. Silesian, ordinary, £18. 7/6.

The Thomson-Houston Motors on Street Railroads.

The Thomson-Houston Electric Company have added two new buildings to their present factory at Lynn. At the present time there are 16 roads in operation using the company's system, and the following will give a good idea of the company's new business, roads in process of construction and those just completed. The overhead construction work at Syracuse is now completed and the cars will be in operation very soon. The road is four miles in length, and will have eight cars in operation. The Lynn and Boston Street Railway Company have decided to use the Thomson-Houston system for the Highland Line, at Lynn. The road has a large number of curves and grades as high as 9 per cent. The road will be in operation early in September, and will use the single overhead conductor and return rail circuit. The Crossstown Railway Company, of Scranton, Pa., will add four of the improved Thomson-Houston trucks, which will be put in operation this month. Work on the machinery of the Hoosac Valley Street Railway at North Adams, is being rapidly pushed forward. The road will be equipped under the Thomson-Houston system, using the single overhead conductor and return rail circuit. The track is five miles long and six cars will be operated. The Revere Street Railway's track construction was completed August 15, and the electrical work on the 16th, and cars are now running regularly. The Des Moines Broad Gauge Railway Company are to equip their seven and one-half miles of track with the same system and will operate eight cars having the latest improved trucks.

The Suburban Street Railway, of Scranton, received, about two weeks ago, an improved motor truck from the Thomson-Houston Electric Company, and two more will be added very soon. The Omaha and Council Bluffs Railway and Brigid Com-

pany will put in a model road, using the Thomson-Houston system. The overhead construction will be used, and the trucks containing all the latest improvements. This road, which is two miles long and on which four cars will be operated, will be one of the finest electric railways in the United States. It will be in operation by September 15. The tracks for the electric railroad at Bangor are now being laid. The Street Railway Company have decided to use electricity and have made a contract for a complete equipment. The road will use the single overhead conductor and is two miles long, and will operate 10 cars, each equipped with a 20 horse-power Thomson-Houston motor. The Seattle Electric Railway and Power Company is a corporation in Seattle, Wash. Ter., which is composed of the Seattle Street Railway Company and the West Street, Lake Union and Park Transit Company. These two companies have decided to unite their interests and equip their entire system with electricity, and have contracted with the Thomson-Houston Company for the equipment of their road. The road, which is to be in operation by January 1, is 4½ miles in length, 3500 feet double track, and will operate five cars.

Our Washington correspondent telegraphs that the Senate tariff bill will not be reported for a few days.

Deaths from yellow fever in Jacksonville to date number 90; total number of cases, 684. Some 20,000 people have left the city and it is believed that not more than 4000 whites remain at their homes. New York City is contributing handsomely for the relief of the sufferers. A single individual gives \$12,000.

The Texas State Capitol building at Austin, one of the most costly structures in this country, was erected by a syndicate represented by Senator C. B. Farwell and others, who were entitled to receive as compensation 3,000,000 acres of land. The building is nearly completed, but the State authorities refuse to receive it on account of alleged defects, one of which is leakage in the massive copper dome. Architect Meyers, of Detroit, who furnished the plans says: "The contractor, G. Wilkie, of Chicago, says the dome was to have been built according to the specifications wholly of cast iron, but that changes were permitted which allowed the substitution of thin galvanized iron, cheapening the work and endangering the stability of the building. The State retains 300,000 acres of land as security for the faithful performance of the work and litigation is in prospect."

Thomas H. Hotchkiss, United States Consul at Ottawa, has sent to the State Department a review of the lumber industry of the Ottawa Valley for the past year. The export of pine to the United States from the Ottawa Valley district for 1887 was, for consumption, 227,139,959 feet, valued at \$2,827,234; in bond for export, 33,698,348 feet, valued at \$610,795. The total exports of pine boards and plank from all of Canada during the same year were 508,304,000 feet, valued at \$6,209,023. The exports of pine saw logs to the United States from all of Canada for the same year were 2,869,000 feet, valued at \$24,452. Mr. Hotchkiss says: "The figures of the export lumber trade of Canada with the United States show that if all the lumber sent into the United States from Canada was placed in the Chicago market it would supply but one-fourth of the requirements of that market alone and but one-half of the quantity handled in either Tonawanda or Buffalo."

Hardware.

Business continues to improve, and the volume of trade is now referred to as very satisfactory. Many orders are being received from the smaller trade through the country, and manufacturers and merchants are busy. There has been little change in the general aspect of the market, prices being without important alteration.

Wire Nails.

There has been no important change in the condition of the Western market, the new arrangement into which the manufacturers have entered working satisfactorily and securing the maintenance of prices. The Eastern manufacturers have made a similar advance and agreed upon the same prices as the Western. The regular quotation for small lots is \$2.65 and for carload lots, \$2.55. The market is thus in a decidedly improved condition, and it is hoped that the era of unprofitably low prices will be succeeded by one in which better prices will prevail.

In our issue of the 30th ult. an error occurred in the paragraph relating to Wire Nails, in which the discount was named as 10 per cent. This was so obvious an error that we presume few in the trade were misled by it. The cash discount remains as before at 2 per cent., and a full statement of the terms is as follows: Terms, 60 days' acceptance, or 2 per cent. discount for cash if paid within 10 days from date of bill of lading.

Cut Nails.

A moderate improvement in the demand is noticed in the New York market, but the prices remain unchanged at \$1.85 @ \$1.90 for carload lots on dock, and \$1.90 @ \$1.95 for small lots from store. The tendency in raw material is upward.

Miscellaneous Prices.

Machine Bolts and Bolt Ends are a shade lower in price, and there is some irregularity in the figures named by the different manufacturers.

Strap and T-Hinges are without material alteration in price and are held pretty steadily by the manufacturers. There is, however, a disposition on the part of some of the jobbing houses to offer them at concessions, which in some cases are very near the extreme price at which the goods are purchased by the wholesale trade.

The Cordage market is in a peculiar position, there being some difficulty in obtaining Rope, most of the manufacturers having shut down for want of Hemp. The general tone of the market is accordingly decidedly firm, but there is not entire uniformity in the prices named by the different manufacturers.

At a meeting of the Associated Spring manufacturers, held in Cleveland, 30th ult., an advance was made in the price of Springs. The discount was fixed at 60 and 5 per cent. from standard list, with a rebate of 5 per cent. if \$750 worth is taken in any six months, or a rebate of 10 per cent., instead of 5 per cent., if \$1500 worth is taken in any six months, the terms being four months, or 3 per cent. discount for cash in 30 days, with the usual delivery.

Stove Boards are in a somewhat demoralized condition, and very low prices are ruling. The competition between the manufacturers has been exceedingly animated, and it is claimed that prices are forced down below the line of profit. The trade have been purchasing largely, and it is impossible to obtain goods promptly from some of the leading manufacturers.

D. R. Sperry & Co., of Batavia, Ill., have just issued their twentieth annual price list. It is of pocket size, and contains 35 pages, illustrating and describing their goods, which consist of Caldrons, Sugar Kettles, Laundry Stoves, Farm Boilers, Mauls, Coffee Roasters, Hollow-Ware, and a great variety of miscellaneous goods made of cast iron. Their Chicago salesroom is at 235 Lake street. Their discounts are as follows, terms 90 days, or 8 per cent. if paid within 10 days :

	Per cent. off.
Caldrons, page 13.....	40&5
Caldrons, in lots of 5 or more, if shipped direct from factory.....	45&5
Castings for setting Caldrons, pages 18 and 19.....	40&5
Baker's Oven Castings, page 20.....	40&5
Sugar Kettles, page 16.....	50
Sugar Kettles, in lots of 8 or more, if shipped direct from factory.....	55
Extra Finished Hollow-Ware, pages 24, 25, 26, 27 and 28.....	50
Plain Hollow-Ware (Tea Kettles, Ham Boilers, Long Pans, &c.).....	55
Laundry Stoves, page 9.....	40
The Dairy Maid, pages 10 and 11.....	35
Farm Boilers, pages 4, 5, 6, 7 and 8.....	40
Mauls, page 21.....	60&5
Wood Face Mauls, page 21.....	35
Coffee Roasters, page 23.....	40
Bake Ovens, Improved Covers, page 22.....	50&5
Drug Mortars, page 30.....	30
Felloe Oilers, page 23.....	45
Foundation Gratings, page 23.....	45
Miscellaneous Goods, pages 32, 33 and 34.....	35

The Plumb & Lewis Mfg. Company, Grand Rapids, Mich., have discontinued making the Cottage and Mystic Carpet Sweepers, and have added the Improved Parlor Queen, nickeled and japanned, and the Excelsior. They issue circulars relating to these goods and their line of Wringers, on which prices are named as given below:

Carpet Sweepers.

	Per dozen.
Improved Parlor Queen, nickeled.....	\$27
Improved Parlor Queen, japanned.....	24
Parlor Queen.....	24
Excelsior.....	22
Garland.....	18
Housewife's Delight.....	15

Wringers.

Gem Bench Wringer.....	52
No. 4 Bench Wringer.....	48
No. 5 Bench Wringer.....	45

Pratt & Co., Elmira, N. Y., announce a new Hanger, named the May. It is made entirely of steel, with the exception of the wheels, which are V-shaped for preventing friction. The point is made in regard to it that it cannot be thrown from the track, and other advantages possessed by it are referred to. It is sold at discount 50 and 5 to 50 and 10 per cent.

In our issue, 23d ult., we had occasion to call attention to an error of the compositor in the Alford & Berkele Company's advertisement, in which the discount on IXL Shells was named as 40 and 50 per cent. instead of 40 and 5 per cent., the correct figure. By some inexplicable mistake the advertisement appeared in our last issue with the same erroneous quotation. Fearing that some may have been misled by this repeated error we desire to remind the trade emphatically that the correct discount is 40 and 5 per cent. We much regret the trouble thus caused the company and their customers.

The following price list of the Triumph Wire Chain manufactured by the Bridgeport Chain Company, Bridgeport, Conn., and adapted especially for hanging pictures, is subject to a discount of 40 and 10 per cent. :

Size.	
No. 0, Brass, Lacquered (tensile strength, 125 pounds).....	\$1.75
No. 0, Brass, Nickel-Plated (tensile strength, 125 pounds).....	2.50
No. 1, Brass, Lacquered (tensile strength, 160 pounds).....	2.00
No. 1, Brass, Nickel-Plated (tensile strength, 160 pounds).....	2.75

The following are the prices of the line of Wringers manufactured by the Empire Wringer Company, Auburn, N. Y. The Volunteer and Daisy Wringers are listed

as follows, with an abatement of \$2.50 per dozen from the prices named:

Volunteer Double Cog Wringer.

	Per dozen.
Size 10, Rolls, 10 x 1 1/4.....	\$27.00
Size 11, Rolls, 11 x 1 1/4.....	31.50
Size 12, Rolls, 12 x 1 1/4.....	36.00

The Daisy Wringer.

	Per dozen.
Size 2, Rolls, 10 x 1 1/4.....	\$22.50
Size 4, Rolls, 12 x 1 1/4.....	31.50

The Empire Purchase Gear and Empire Bench Wringers are sold from the following list, net:

The Empire Purchase Gear Wringers.

	Per dozen.
Size 3, Rolls, 10 x 1 1/4.....	\$36
Size 4, Rolls, 11 x 1 1/4.....	48
Clamps for round or set tube, as desired.	
Size 5, Rolls, 12 x 1 1/4.....	60
Size 12 1/2, Rolls, 12 x 1 1/4 (special).....	72
Size 50, Rolls, 12 x 1 1/4 (special).....	63

Size 14, Rolls, 14 x 2 1/4 (pulleys).....	162
Size 16, Rolls, 16 x 2 1/4 (pulleys).....	222

Empire Bench Wringers.

	Per dozen.
Size 3, Rolls, 10 x 1 1/4.....	\$51
Size 4, Rolls, 11 x 1 1/4.....	60
Size 5, Rolls, 12 x 1 1/4.....	72

A New Departure.

A movement which has for some time been under consideration, and which is of general interest to the Hardware trade as being in some respects a new departure, has been at last consummated. H. C. Marshall, who has been associated for a number of years with Clement M. Biddle, has been engaged by a number of large wholesale Hardware houses as their resident buyer, his office being at 110 Chambers street, in this city. Leading houses of St. Louis, St. Paul, Chicago, Pittsburgh, Cleveland, Boston, Philadelphia and other points are thus represented. Much of the significance of this syndicate or arrangement is in the fact that these houses are among the very largest in the country, with the exception of the great St. Louis and Chicago jobbers, Hibbard, Spencer, Bartlett & Co., Horton, Gilmore, McWilliams & Co., and Simmons Hardware Company. It will thus be seen that Mr. Marshall represents a number of houses the aggregate of whose purchases will be very large. The object of the arrangement is stated to be to save expense by having a common representative with headquarters in this city, and branch offices in one or two leading manufacturing centers, while at the same time it is anticipated that the aggregate of the orders of these houses will secure them the most advantageous terms in the purchase of their goods. The fact that all the houses thus united in the arrangement for the purchase of their goods are among the largest in the country, and occupy, as nearly as may be, positions of equal prominence, entitling them to the best prices, is referred to as avoiding some of the mischiefs connected with so-called syndicate buying, in which smaller houses sometimes obtain prices to which they are scarcely entitled. Another objection which the manufacturers have felt to arrangements somewhat similar is removed by the fact that in this case the goods purchased by their representative are charged in all cases directly to the several houses, thus permitting the manufacturer to have direct dealings with the parties who handle his goods. It is expected by those interested in this movement that the combination of the orders of these houses will enable them to secure the most favorable terms from manufacturers, lower, it is hoped, in some cases, than can be obtained by any of their competitors, and that at the same time the manufacturers will not regard the movement with especial disfavor, but will be, on the other hand, desirous of securing the orders of these associated concerns.

Export Trade.

The recent mails from Australia are referred to as bringing very satisfactory orders for American goods, and the gradual, and in some markets marked, increase of our business is noted with satisfaction. We give below some data in regard to recent shipments from this port, which will indicate the character of goods which are being sent abroad and the houses through whom they are exported:

PER BRIG WAN BUN, AUGUST 31, FOR CAPE TOWN, AFRICA.

By *W. H. Crossman & Co.*—10 dozen Axes, 2 cases Hardware.
By *Arkell & Douglas*.—1 Refrigerator, 6 dozen Churns, 3 Lawn Mowers.
By *R. W. Forbes & Co.*—47 packages Carriage Woodwork, 2 dozen Forks, 8 dozen Hatchets, 56 dozen Handles, 1 package of Hardware.
By *M. Berliner*.—3 packages Blocks, 53 pounds Twine, 24 Stoves.
By *Henry W. Peabody & Co.*—1120 pounds Rope, $\frac{1}{2}$ dozen Grindstones, 10 dozen Handles.
By *W. B. Fox & Bro.*—400 pounds Wood Handles, 750 pounds Hardware.
By *New Home Sewing Machine Company*.—4 boxes Sewing Machines.
By *Coombs, Crosby & Eddy*.—10 cases Weights, 1 case Cord, 50 sets Bows, 2432 Spokes, 9 cases Axle Grease, 600 pounds Nails, 6 dozen Wood Faucets, 1 case House Furnishing Goods, 15 dozen Handles.

PER BARK PEERLESS, SEPTEMBER 1, FOR PORT NATAL, AFRICA.

By *W. H. Crossman & Co.*—1050 pounds Sash Weights, 76 pounds Cord, 24 cases Plow Parts.
By *J. A. Gifford*.—1 barrel Hardware, 2 packages Carriage Woodwork.
By *R. W. Cameron & Co.*—54 cases Plows.
By *Corner Bros. & Co.*—60 cases Agricultural Implements, 22 barrels Hardware, 96 cases Hardware, 51 cases Agricultural Implements.
By *H. W. Peabody & Co.*—11 cases Agricultural Implements, 2 cases Hardware, 30 dozen Shovels, 10 cases Agricultural Implements, 16 cases Edge Tools.
By *Coombs, Crosby & Eddy*.—7 Pumps, 2 dozen Tools, 2 dozen Picks, 30 dozen Hammers, 100 pounds Nails, 3 dozen Carriage Ware.
By *Marcial & Co.*—2 dozen Axes, 2 dozen Picks, 11 dozen Hammers, 30 dozen Shovels.

PER BRIG ELECTRIC LIGHT, SEPTEMBER 6, FOR EAST LONDON.

By *Arkell & Douglas*.—12 cases Plow Parts, 1 case Castings, $1\frac{1}{2}$ dozen Whip Stocks, 48 Plows, 5 cases Hardware, 2 cases Tacks, 9 dozen Bits, 1 dozen Churns, $\frac{1}{2}$ dozen Lawn Sprinklers, 24 dozen Saws, 9 dozen Knives, $\frac{1}{2}$ dozen Scales, $8\frac{1}{2}$ dozen Axes, 1 case Whetstones, 8 dozen Axes, 2 cases Saws, 1 case Fret Saws, 22 Blocks, 1 dozen Drawer Knives, 16 dozen Granite Ware, 1 case Hardware, 24 dozen Saws, 2 dozen Apple Parers, 1 case Hinges, $3\frac{1}{2}$ dozen Gas Fixtures, 10 dozen Bits, 2 crates Washers, 1 dozen Hatchets, 6 dozen Handles, 6 pairs Springs, 50 dozen Handles, 112 Plows, 1 barrel Rope, 21 dozen Axes, 500 Handles, 109 kegs of Nails, 20 dozen Handles, 18 boxes Sash Weights, 15 Hinges, 76 packages Plow Fittings, 24 dozen Hatchets, 3 Ranges, 3 packages Utensils, 1 dozen Scales, 18 Washing Machines, 132 cases Agricultural Implements.
By *Corner Bros. & Co.*—2 cases Agricultural Implements.
By *W. H. Crossman & Bro.*—10 dozen Axes, 10 dozen Hatchets, 1250 pounds Sash Weights, 183 pounds Cord, 90 cases Plow Parts, 10 Scrapers, 27 packages Carriage Ware, 10 pounds Cotton Twine.
By *R. W. Forbes & Son*.—9 packages Hardware, 1 dozen Wringers, 6 dozen Axes, $\frac{1}{2}$ dozen Snaths, 12 dozen spades, 29 cases Nails, 16 dozen Traps, 8 sets Axes.

PER BARK CAMELOT, SEPTEMBER 8, FOR FREEMANTLE, AUSTRALIA.

By *F. B. Wheeler & Co.*—2 cases Castings.
By *H. W. Peabody & Co.*—11 cases Hardware, 160 pounds Stone, 27 cases Fire Arms, 3 dozen Egg Beaters, 5 packages Traps, 6 dozen Whips, 400 papers Nails, 12 dozen Bells, 7 cases Edge Tools, 1 case Dust Pans, 1 bundle Carriage Ware, 3 dozen Stroops, 4 cases Sewing Machines, &c., 8 packages Agricultural Implements, 7 packages Windmills, 1-6 dozen Pumps, 3 cases Bolts, 43 packages Carriage Ware, 9 dozen Shovels, 550 dozen Handles, 2 packages Agricultural Implements, 5 packages Hardware, 500 pounds Castings, 36 dozen Shade Rollers, 8 1-4 dozen Pumps, 7 cases Axes, $\frac{1}{2}$ dozen Primers, 1 case Agricultural Implements, 1 bundle Hardware, 7 dozen Edge Tools, 1000 Handles, 1 case Handcuffs, 1 case Drilling Machinery, 1 case Wire Goods,

5 cases Agricultural Implements, 5 cases Hardware, 1150 pounds Bolts, 6 cases Fire Arms, 2 packages Pumps, 13 packages Hardware, 2 packages Agricultural Implements, $\frac{3}{4}$ dozen Wringers, $\frac{1}{4}$ dozen Pumps, 4 packages Hardware, 1 case Agricultural Implements.

By *R. W. Forbes & Son*.—11 packages Hardware, 15 dozen Axes, 5 dozen Hay Forks, 127 dozen Tool Handles, 12 dozen Shovels, 1 dozen Scales, 4 packages Pumps, 6 dozen Axes, 34 dozen Handles, 4 packages Churns, 1 dozen Trucks, 8 dozen Axes, 10 packages Pumps.

By *W. H. Crossman & Bro.*—4 $\frac{1}{2}$ dozen Saws, 26 packages Carriage Ware, $1\frac{1}{2}$ dozen Churns, 6 dozen Scythes, 6 dozen Snaths, $\frac{1}{2}$ dozen Washers, 57 dozen Cow Bells, 32 dozen Axes, 22 dozen Hatchets, 3 dozen Mattocks, 118 dozen Handles, 266 pounds Nails, 30 dozen Hay Forks, 4 Stoves, 5 dozen Stencils, 12 dozen Fly Traps, 2 gross Axle Grease, 2 dozen Guns, 7 cases Cartridges, 7 cases Hardware, 3 cases Hardware, 5 cases Carpenters' Tools.

Items.

The Cincinnati Lead Pipe and Sheet Lead Works, John D. Abraham, proprietor, 21 and 23 East Ninth street, Cincinnati, Ohio, have issued one of the most complete catalogues devoted to this line of goods which is placed at the service of the trade. It represents a varied line of Lead Pipe, Sheet Lead, Pumps, Plumbers', Steam and Gas Fitters' Supplies, Iron Pipes and Fittings, Brass Goods, Sanitary Specialties, &c. It is a volume of more than 500 pages, which is utilized in a compact and judicious display of the different goods. The cuts are for the most part of medium size, and avoid the extremes into which manufacturers and merchants sometimes fall. They are sufficiently large to represent the goods clearly, while permitting the display of a varied line in a volume of convenient size. The catalogue has a full and satisfactory index, and is substantially bound.

C. E. Hudson, Leominster, Mass., advises us that he has recently had some complaint from his Western trade that the Little Star Parer, Corer and Slicer was not what he represented it to be, and that it could be bought from certain dealers at less than he was charging for it. Upon investigation it was found that certain parties were selling the Hudson '88 for the Little Star Parer, a substitution which was possible where the parties were not acquainted with both machines. They look very much alike, but the '88 machine is inferior to the Little Star, being a cheaper machine and intended for a class of trade who are unwilling to pay the price of the Little Star. Mr. Hudson desires to remind parties intending to purchase the Little Star that the name Little Star is cast on the frame of the machine, so that the trade can easily determine whether or not they are receiving this machine.

Dauchy & Co., manufacturers of Sidewalk and Vault Lights, Chicago, having found their business outgrowing the facilities offered in their present location at 127 Indiana street, are erecting a new building on Illinois street, between Wells and Franklin streets. The building will be especially adapted to their purposes and will include a foundry for the purpose of making their own castings. Hitherto they have had this work done by outside foundrymen. The new works occupy a lot 64 feet front by 100 feet deep. The building is of brick and is of peculiar design. The front portion is five stories high, including a large and well-lighted basement. The foundry occupies a one-story extension in the rear. The front building will be used for office purposes and will also be stocked with the necessary machinery for fitting and finishing work. The new works will be ready for occupancy in about a month. The name of the firm is also to be changed to Dauchy Iron Works, for which a charter of incorporation has been secured. The

officers of the new company are as follows: George K. Dauchy, president; C. H. Ross, vice-president; L. O. Dauchy, secretary; Samuel O. Dauchy, treasurer. With the advantages and increased facilities which will be enjoyed in the new establishment, the proprietors look forward to a considerably increased business.

The Goodell Company, Antrim, N. H., for whom the Alford & Berkele Company, 77 Chambers street, New York, are agents, have issued a revised catalogue of their Table Cutlery, Butcher and Shoe Knives, &c. In this list some changes are to be noted and some new patterns are represented, among which may be mentioned Nos. 1375 C, 1385 C, 2375 C and 2385 C, Table and Medium Knives and Forks. It will interest the friends of the company throughout the country to know that David H. Goodell, the president and principal stockholder of the company, is the Republican nominee for Governor of New Hampshire.

Chambers, Brother & Co., Philadelphia, have transferred their business to Chambers Bros. & Co., a corporation organized under the laws of the State of Pennsylvania. The stockholders of the new company comprise the members of the old firm of Chambers, Brother & Co., and there has been no change in the management of the business except that it will be hereafter carried on by a corporation in lieu of a partnership.

Wall Mfg. Company, Cobalt, Conn., who are well known as manufacturers of Sleigh, Hand, House and Gong Bells, have appointed J. C. McCarty & Co., 97 Chambers street, New York, their sole agents for the sale of their goods in the United States, and also for the export trade.

The Barton Bell Company, formerly of Easthampton, Conn., have removed their entire business to Marion, Ind., and have issued their illustrated price list No. 96, which shows the line of goods of which they are well-known manufacturers with the new styles and patterns lately added. In their introductory address to the trade they refer to the fact that the larger part of their product has been sold west of New York and Pennsylvania, while their raw materials, Copper, Spelter and Leather, coming from the West, they concluded that it would be in the interest of economy to establish a manufactory near the consumers and thus effect a saving of transporting the raw material from the West to New England and the finished product back again to the Western consumers. While in this way freight is saved, the saving of time is also mentioned, the company's location being now such that they can communicate by mail with the principal cities of the West in from 6 to 36 hours. The company have erected commodious buildings of stone, brick, iron and wood and have also added materially to their plant of machinery. There is a gas well in connection with the factory,

The trade will learn with regret of the sudden death, on the 3d inst., of William A. Cassell, of the well-known Hardware firm of Fillmore, Cassell & Co., Zanesville, Ohio.

Sidney Shepherd & Co., Buffalo, N. Y., and C. Sidney Shepard & Co., Chicago, Ill., call attention in their advertising space, on page 64, to the Buffalo Mincing knife, the special feature of which is that it has a double adjustment, as indicated in the illustrations.

The catalogue issued by N. R. Streeter & Co., Rochester and Groton, N. Y., is a neat pamphlet in which the different styles of Laundry Hardware are represented. In the introductory circular to the trade information is given in regard to the efforts made to secure the high qual-

ity of the goods, while the subsequent pages give detailed descriptions of the different articles, including Smoothing, Polishing and Fluting Irons, which are their leading line. Can Openers, Twine Holders, Vegetable Mashers, Ice Tools, Meat Masticators and other goods are also represented.

D. Round & Son, Cleveland, Ohio, manufacturers of Chain, Differential Pulley Blocks, &c., have appointed J. C. McCarty & Co., 97 Chambers street, New York, their agents, and we are advised that they will be at all times prepared to name the most favorable terms.

John P. Lovell's Sons, Boston, Mass., in their advertisement on page 61 show, it will be observed, a variety of styles of Campaign Helmets which they are putting on the market, and these goods, although somewhat outside of the regular Hardware line, will doubtless at this time be regarded by the trade with especial interest. This feature of the company's business, though a temporary one, has already reached, we are advised, large proportions. Hibbard, Spencer, Bartlett & Co., Chicago, Ill., and the E. C. Meacham Arms Company, St. Louis, Mo., are the Western distributors of the goods.

The Chapman Manufacturing Company, Meriden, Conn., some of whose goods are represented in their advertisement on page 58, have issued a new and very satisfactory catalogue and price list of Chime Sleigh Bells, Plumes, &c., which they are putting on the market. A number of novel and attractive styles are represented in connection with the staple goods and patterns which have heretofore been on the market. The catalogue is a handsomely printed pamphlet of nearly 60 pages and is fully illustrated.

Moore & Barnes Mfg. Company, 103 Chambers street, New York, issue a circular relating to the Surprise Clothes Wringer, manufactured by the Auburn Wringer Company, Auburn, N. Y., for whom they are agents. Full and explicit information is given in regard to this Wringer, and the points which are made in its favor are enumerated.

The trade will observe among the Special Notices on page 47 one in which the stock and business of a well-known Missouri River jobbing house are offered for sale. Those who are interested in such an opportunity will find information given in regard to the trade of the city and the house, and other points tending to show the desirability of the opening. It is intimated that the house are not desirous of disposing of the stock before January 1, and by that time it can be reduced to between \$50,000 and \$60,000 worth. Further particulars may be obtained from William B. Fox & Brother, 97 Chambers street, New York.

F. G. Ford, Shawmont avenue, Rockborough, Pa., issues circulars relating to some of his patented specialties, rights for which he is offering for sale. They include his combined Milk Strainer and Sprinkler, Common Sense Funnel, Centennial Milk Strainer, Hook and Socket for carriage and sleigh seats and other articles.

The St. Joseph Pump Company, St. Joseph, Mo., issue circulars describing the Perfection Water Elevator and Purifying Pump, the construction and advantages of which are explained. They allude especially to their new Cup or Bucket, which is described as made of one piece of open-hearth steel, cut out by a die and folded in shape, with double flanges and double seam. They refer also to the extent of their plant and their facilities for the prompt execution of orders for carload lots.

Our readers will observe an important announcement on page 47 in regard to the sale of the business of William A. Ives & Co., near New Haven, Conn. The opportunity is deserving the attention of those who desire such an investment.

L. Bolles Hoe and Tool Company, Binghamton, N. Y., have issued their price list for 1888-1889, in which their well-known lines of Hoes is represented. The list as given is revised to date.

It will be seen that Dame, Stoddard & Kendall, Boston, Mass., in their advertisement on page 55 show the New Acme Pattern Ladies' Skate, which is placed on the market this season for the first time. They also illustrate the American Acme Pattern Club Skate, and call attention to their complete line of Winslow's Ice Skates.

The American Tool Company have removed from 116 Chambers street to 200 West Houston street. In their old quarters they were rather cramped for room, and were compelled to seek larger accommodations. They are now in a five-story building where they have increased capacity for filling large orders for Tool Chests promptly. Attention is called to their advertisement on page 56.

J. E. Davis & Co. have succeeded Nettleton & Davis as manufacturers' agents for the sale of Hardware, at 115 Dearborn street, Chicago. J. K. Nettleton retires on account of ill health.

Steel Goods.

The market for Hoes and Forks is regarded as in an exceptionally satisfactory condition, and the fact that Wood Goods are also in good shape improves the situation. Orders are reported to be coming in freely, and it is thought not unlikely if the present condition of things continues that a slight advance may be made before very long. While no intimation is given by the manufacturers of an advance in quotations, it is considered by some well-advised parties that merchants who place their orders early will be on the safe side. We give below the standard list of the Fork and Hoe Makers' Union, in which it will be observed that a few changes have been made since the close of the past season. It will be of interest to the trade as giving them the accurate list and other points in regard to the goods. The regular discount, it will be remembered, is 65 and 5 per cent., the terms of sale being that all goods shipped between November 1 and March 1, for spring trade, shall be 60 days from March 1, or 2 per cent. discount for cash within 10 days from March 1, and on all other goods 60 days from date of shipment, or 2 per cent. discount for cash within 10 days:

Socket and Solid Shank Hoes.

	Per dozen.
Polished Cast Steel Socket Hoes, Selected Handles.....	\$9.00
Polished Cast Steel Socket Hoes (second quality).....	8.25
Polished Cast Steel Solid Shank, Selected Handles.....	8.00
Polished Cast Steel Solid Shank (second quality).....	7.25
Polished Cast Steel Solid Shank Ladies' Hoes.....	6.00
Polished Cast Steel Solid Shank Onion or Nursery Hoes.....	7.00
Polished Cast Steel Socket Onion or Nursery Hoes.....	8.00
Polished Cast Steel Solid Shank Mortar or Street, 6 ft. handle, 10 in. blade.....	13.00
Polished Cast Steel Solid Shank, Mortar or Street, 9 in. blade.....	12.00
New Pattern Special Mortar Hoe.....	15.00
Polished Cast Steel Solid Shank California Hoes, 9 in. blade.....	12.00
Polished Cast Steel Solid Shank Toy Hoes.....	4.25
Polished Cast Steel Solid Shank Boys' Hoes, 48 in. handles, blades 5½ to 6 in., by 4 in. deep.....	7.00
Polished Cast Steel Solid Shank Riveted Hoes.....	5.25
Polished Cast Steel Socket Riveted Hoes.....	5.50
Washington County Solid Shank Hoes.....	9.00
Washington County Socket Hoes.....	10.00
Socket Mortar or Street and California Hoes, \$1.50 per doz. additional.	
Handles in Field Hoes limited to 4½ ft. in length.	

Handles in Mortar Hoes 6½ and 7 ft. advance 75 cts. per foot per doz. list, and over 7 ft. advance \$1 per foot per doz. list for the excess over 6 ft.

Extra for riveting or nailing punched Shanks in Hoes 50 cents per dozen list.

The cold rolled Socket and Shank Field Hoes, made by the Ely Hoe and Fork Company, list 25 cents per dozen less than regular.

Solid Shank Handled Planters' Hoes.

	Per dozen.
Polished Cast Steel Planters' Hoes, 6 and 6½ inch blades, 4½-foot handles.....	\$9.50
Polished Cast Steel Planters' Hoes, 6½-inch blades, 5-foot handles.....	10.00
Polished Cast Steel Planters' Hoes, 7-inch blades, 5-foot handles.....	10.50
Polished Cast Steel Planters' Hoes, 7½-inch blades, 5½-foot handles.....	11.00
Polished Cast Steel Planters' Hoes, 8-inch blades, 5½-foot handles.....	11.50
Polished Cast Steel Planters' Hoes, 8½-inch blades, 5½-foot handles.....	12.00
Polished Cast Steel Planters' Hoes, 9-inch blades, 5½ or 6 foot handles.....	12.50
Polished Cast Steel Planters' Hoes, 10-inch blades, 5½ or 6 foot handles.....	13.50
Socket Planters' Hoes, \$1.50 per dozen above list on Shank Hoes of same width of blade.	

Solid Shank Cotton Hoes.

Cast Steel Cotton Hoes, 6 and 6½ inch blade, 4½-foot handles.....	\$8.25
Cast Steel Cotton Hoes, 6-inch blade, 5-foot handles.....	8.50
Cast Steel Cotton Hoes, 6½-inch blade, 5-foot handles.....	8.50
Cast Steel Cotton Hoes, 7-inch blade, 5-foot handles.....	8.75
Cast Steel Cotton Hoes, 7½-inch blade, 5-foot handles.....	9.00
Cast Steel Cotton Hoes, 8-inch blade, 5½-foot handles.....	9.50
Cast Steel Cotton Hoes, 8½-inch blade, 5½-foot handles.....	10.00
Cast Steel Cotton Hoes, 9-inch blade, 5½-foot handles.....	10.50
Cast Steel Cotton Hoes, 10-inch blade, 6½-foot handles.....	11.50
Socket Cotton Hoes, \$1.50 per doz. additional.	

Weeding Hoes and Rakes.

Polished Cast Steel, 6-teeth Weed Hoes and Rakes.....	\$9.50
Polished Cast Steel, 4-teeth Weed Hoes and Rakes.....	8.50
Six-teeth, Malleable Iron, Full Polished, Cast Steel Blade.....	5.50
Four-teeth, Malleable Iron, Full Polished, Cast Steel Blade.....	5.00
Polished Cast Steel, Sharp or Square Point Weed Hoes.....	5.75
Polished Cast Steel, Two-Prong Weed Hoes.....	7.00
Polished Cast Steel, Five-Prong Weed Hoes.....	8.00

Garden Rakes.

Polished Cast Steel, 6-teeth Garden Rakes.....	\$6.00
" " 8-teeth ".....	8.00
" " 10-teeth ".....	9.00
" " 12-teeth ".....	10.00
" " 14-teeth ".....	11.00
" " 16-teeth ".....	12.00

"Braced" Steel Garden Rakes advance \$1.50 per dozen list.
Socket Steel Garden Rakes advance \$1.50 per dozen list.

Manure Forks.

Round 4-Tine, L. H. Cast Steel Forks, Common Ferrule.....	\$12.50
Round 4-Tine, L. H. Cast Steel Forks, Strap Ferrule.....	14.00
Round 4-Tine, D. H. Cast Steel Forks, Common Ferrule.....	13.50
Round 4-Tine, D. H. Cast Steel Forks, Strap Ferrule.....	15.00
Oval 4-Tine, L. H. Cast Steel Forks, Common Ferrule.....	12.50
Oval 4-Tine, L. H. Cast Steel Forks, Strap Ferrule.....	14.00
Oval 4-Tine, D. H. Cast Steel Forks, Common Ferrule.....	13.50
Oval 4-Tine, D. H. Cast Steel Forks, Strap Ferrule.....	15.00
Oval 5-Tine, D. H. Cast Steel Forks, Common Ferrule.....	20.50
Oval 5-Tine, D. H. Cast Steel Forks, Strap Ferrule.....	22.00
Oval 6-Tine, D. H. Cast Steel Forks, Common Ferrule.....	23.50
Oval 6-Tine, D. H. Cast Steel Forks, Strap Ferrule.....	25.00
Round 5 and 6 Tine Forks, same price as oval.	
Long Handles on 5 and 6 Tine Forks, \$1 per dozen less than D Handles.	
Handles over 4½ feet on Manure Forks, advance 75 cent per foot per dozen list.	

Spading Forks.

Cast Steel, 4 Flat-Tine D. H. Spading Forks, Common Ferrule.....	\$17.00
Cast Steel, 4 Angular-Tine, D. H. Spading Forks, Common Ferrule.....	18.00
Cast Steel, 4 Angular-Tine, D. H. Spading Forks, Com. Ferrule, 5 lbs. less weight.....	17.00
Cast Steel, 4 Angular-Tine D. H. Spading Forks, Com. Ferrule, 5 lbs. less weight, blued and half polished.....	16.00
Cast Steel, 4 Angular-Tine D. H. Spading Forks, Common Ferrule.....	24.00
Extra Heavy Square Shoulder Spading Forks advance \$2 per dozen list.	
Long Handles on Spading Forks, \$1 per dozen less than D. H.	
Strap Ferrules on Spading Forks, more per dozen, \$1.50.	

Hay and Straw Forks.

Round 2-Tine, Cast Steel Forks, Common Ferrule.....	\$7.25
Round 2-Tine, Cast Steel Forks, Strap Ferrule.....	8.75

Oval 2-Tine, Cast Steel Forks, Common Ferrule.....	7.25
Oval 2-Tine, Cast Steel Forks, Strap Ferrule.....	8.75
Round 3-Tine, Cast Steel Forks, Common Ferrule.....	9.00
Round 3-Tine, Cast Steel Forks, Strap Ferrule.....	10.50
Oval 3-Tine, Cast Steel Forks, Common Ferrule.....	9.00
Oval 3-Tine, Cast Steel Forks, Strap Ferrule.....	10.50
2-Tine C. S. Boys' or Tedding Forks, 4 1/2-foot handle, 8 1/2-inch tine.....	6.00
3-Tine C. S. Boys' or Tedding Forks, 4 1/2-foot handle, 10 1/2-inch tine.....	7.75
With bent handles, extra per dozen, 50 cents.	
Twelve inches (as near as practicable) measured in a straight line from inside of the head to the point, is the standard length of Tine on all regular Hay.	
Straw and Four Tine Manure Forks, except with the D. Handle 4 Tine Manure Forks, which may be made 13 inches.	
14-inch Manure Forks shall be advanced \$1.50 per doz. over the standard list.	

Forks with Extra Length of Tine.

3 Tine Hay, Straw and Barley Forks.	Per dozen.
3 Tine, 13 inch, more than 12 inch, 50 cents, making.....	\$9.50
3 Tine, 14 inch, more than 13 inch, 75 cents, making.....	10.25
3 Tine, 15 inch, more than 14 inch, \$1, making.....	11.25
3 Tine, 16 inch, more than 15 inch, \$1.25, making.....	12.50
With Bent Handles, extra per doz. 50 cts.	
With Strap Ferrules, extra per doz. \$1.50.	
4 Tine Hay, Straw and Barley Forks, Bent Handles.....	
4 Tine Hay, Straw and Barley Forks, Bent Handles.....	\$12.50
4 Tine, 13 inch, more than 12 inch, 75 cents, making.....	13.25
Round or Square Shoulders, 14 inch, more than 13 inch, \$1, making.....	14.25
Round or Square Shoulders, 15 inch, more than 14 inch, \$1.25, making.....	15.50
Round or Square Shoulders, 16 inch, more than 15 inch, \$1.50, making.....	17.00
Extra for riveting or nailing punched Shanks in Forks.....	.50
4 Tine Barley Forks, 18 inch Tine, with Guard, Bent Handles.....	22.50
With Straight Handles, less per dozen, 50 cts.	
With Strap Ferrules, more per dozen, \$1.50.	
Handles in Hay, Straw and Barley Forks 6 1/2 and 7 ft. advance 75 cts. per foot per doz. list, and over 7 ft. advance \$1 per foot per doz. list for the excess over 6 ft.	

Potato and Manure Hooks.

Round 4 Tine, Cast Steel Potato Hooks.....	\$7.50
Round 4 Tine, Cast Steel Potato Hooks, Oval or half Oval.....	7.50
4 Tine, Cast Steel Potato Hooks, Washington County Pattern.....	12.00
Flat 4 Tine, Cast Steel Potato Hooks, Red and Blue Extra Finish.....	8.50
4 Tine, Cast Steel Potato Hooks, Diamond or Oval Back.....	9.50
5 Tine, Cast Steel Potato Hooks, Round or Oval.....	10.00
5 Tine, Cast Steel Potato Hooks, Round or Oval, Goose Neck.....	10.00
6 Tine, Cast Steel Potato Hooks, Round or Oval.....	11.00
6 Tine, Cast Steel Potato Hooks, Round or Oval, Goose Neck.....	11.00
4 Tine, Potato Hook, Flat or Oval Back, Bent Tines, heavy.....	10.50
5 Tine, Malleable Iron, Round or Oval.....	5.50
4 Tine, Cast Steel Manure Hooks, Round or Oval, 6 ft. Handle.....	10.00

Second Quality Hay and Manure Forks.

2 Tine, \$0.75 per dozen less than regular goods.	
4 " " 1.00 " " " "	
4 " " 1.50 " " " "	
4 " " 2.00 " " " "	
6 " " 2.50 " " " "	

Second quality Forks shall be those apparently inferior to first quality goods, and shall in all cases be put on second grade handles.

Third Quality Manure Forks.

4 Tine 4 1/2 ft. Handles, half polish, 1 1/2 inch Tine, Common Ferrule.....	\$9.00
4 Tine, 4 1/2 ft. Handles, half polish, 1 1/2 inch Tine, Strap Ferrule.....	10.50
4 Tine D Handles, half polish, 1 1/2 inch Common Ferrule.....	10.00
4 Tine D Handles, half polish, 1 1/2 inch Tine, Strap Ferrule.....	11.50
Turf Edgers. Clam Hooks.	
Shank Turf Edgers.....	\$9.00
Socket Turf Edgers.....	10.00
6 Prong Clam Hooks.....	12.00

Trade.

From our Louisville correspondent we have the following advices in regard to the Hardware business of that city:

The Hardware trade of Louisville, Ky., continues good in all lines, the volume gradually increasing as the fall comes on. The abundant crop yields, although realizing low prices, insure certain returns on the country merchants' calculation. This class of customers has been very cautious in buying, but frequently lately the jobbers have had good levers to work on, such as advances in Nails, Bar and Sheet Irons, Bolts, &c., all of which bear good results. With the exception of Nails, the dealers have been fully forewarned of advances, and were able to lay in good stocks,

on which they are reaping nice profits. Bar Iron is holding firm from mills at last advance, and Sheet Iron is scarce at buyers' prices. This fact makes it easy to sell from store, and the demand is increasing. Barbed and Plain Wire, instead of sympathizing with other commodities, have taken another cut and are now selling at lower prices than ever known before. A sudden upward movement is looked for, yet the dealers are afraid to contract ahead for fear of still lower figures. Recent advances are being well upheld; occasionally some factory, jealous of competitor's heavy shipments, makes sly cuts to large customers, but this is rare, and firm prices rule. The retailers are having a good trade with contractors and country customers, and the House-Furnishing business, such as Stoves, Grates, &c., is beginning to be lively. The Furniture factories have about all they can attend to. There is no complaint from dealers, and the one answer from all is that business is good.

The Competition in Ciphers.

Besides lists of cipher words in accordance with the terms of the competition we are receiving also a number of answers to the problem given in our last issue, some of our correspondents at the same time expressing their views in regard to the general subject, and others explaining the manner in which the solution was reached. One of our correspondents writing from Philadelphia explains his method as follows:

The last letters of prices per half dozen, *t, m, k, l, o*, must be even, and the others, *r, w, a, s, e*, odd. The first four prices, *r, w, a, s*, must be greater than 1, since their products by 6 have two figures. Therefore *e* = 1 and from price of Manicure Cases *o* = *e* x 6 = 6. Either *k* or *m* may equal 0, these being the only even figures which do not begin prices. But from price of Bird Seed, since *e* = 1, *k* must equal 2 or 8. Therefore, *m* = 0. From price of Tooth Brushes, since *m* = 0, *a* = 3, and *w* = 5. From price of Bird Seed, since *a* = 3, *k* = 8. From price of Soap, since *w* = 5, *l* = 4 and *s* = 9. From price of Nail Brushes, since *l* = 4, *t* = 2 and *r* = 7. The word used is, therefore, *metalworks*.

The correspondent whose letter is given below refers to the problem in the following terms:

Your correspondent in current issue of *The Iron Age* is evidently more of a mathematician than business man. His cipher is too easy. It was seen after a few minutes' examination that he sold half a dozen for just six times the price of one, which is not usual. Had he marked his goods as follows:

	Each.	Per half dozen.
Nail Brushes.....	r	a k
Tooth Brushes.....	w	t w
Bird Seed, packages.....	a	e o
Soap, cakes.....	s	w m
Cologne, bottles.....	o l	a t m
Manicure cases.....	t a e	e t t w

he would have more nearly approached a price and caused more difficulty in solving the cipher, which, as it was, was no task at all. In fact, the only catch was another business error in having the figure 0 represented by the first letter instead of the last of his cipher, as it resulted in obtaining "etal works m," instead of metal works. It is usual and more natural to count 1, 2, &c., leaving the last letter for the cipher, a person remembering the word much easier that way. Give us a harder one.

SYRACUSE.

A correspondent in Bloomington, Ill., writes as follows in regard to the competition:

It seems to me that you might make your specifications a little plainer and for this purpose I beg to ask the following questions: Do you mean to restrict the list to words found in the main part of the dictionary and supplement, which give only English words and their definitions,

and to exclude all proper names, Bible names, &c., which are not found in these two sections of the dictionary? Further, do you allow the use of plurals of words which are found in the two sections named above?

The spirit of the conditions which we gave in announcing this contest would exclude Bible names, proper names, &c., and all words not found in the main part of the dictionary and the supplement. We do not think that plurals are necessarily excluded. Inasmuch as our correspondent asks for supplementary instructions we can only express an opinion and cannot make this binding, for since the publication of the conditions the whole matter has been in the hands of the committee who are to determine the result. We give this simply as our own interpretation of the conditions as first presented. We trust this will be of assistance to our correspondent.

Another solution of the cipher problem is as follows, and comes from Cleveland, Ohio:

By writing down the numbers from 1 to 9 and multiplying each by 6 as follows:

1 x 6 = 6
2 x 6 = 12
3 x 6 = 18
4 x 6 = 24
5 x 6 = 30
6 x 6 = 36
7 x 6 = 42
8 x 6 = 48
9 x 6 = 54

We see that all the even numbers, 2, 4, 6, 8, are repeated in the product when multiplied by 6, while the odd ones are not. This shows that the first four prices given are all odd numbers, as the respective letters are not repeated in the half dozen prices. We see, further, that in the half dozen prices of the first four articles the letter "l" appears twice, so by setting off the odd numbers, with their products:

1 x 6 = 6
3 x 6 = 18
5 x 6 = 30
7 x 6 = 42
9 x 6 = 54

we find that the number 4 occurs twice; therefore "l" must be 4 and, by comparison, "l" is 42; "w l" 54, and, by division, "r" is 7 and "s" is 9. The balance are easily found; for "a l" being 54, "a" is 5 and 5 x *a* = *a m*, or 30, and, if "a m" is 30, *a* is 3 and "e k" 18. This gives all the answers, except for 0, which can be found by dividing "a k l" or 384 by 6, giving 64, making 0 equal to 6. The price mark complete is:

METAL WORKS

0 1 2 3 4 5 6 7 8 9

Trade Topics.

Relating to the arrangement of Hardware stores we have the following letter from a Pennsylvania merchant, in which he makes an appeal for more information from the smaller retailers in regard to their store methods and arrangements. While many of the contrivances which we have described have been received from the class designated, and while others can be adapted with more or less modification by this class of trade, we take pleasure in emphasizing the point made by our correspondent, and requesting contributions on this subject in accordance with his suggestion:

No doubt the readers of *The Iron Age* take great pleasure in reading the details about business and Hardware stores, as given from time to time, but it strikes me that the large dealers are generally the ones represented. I have an idea that the bulk of the retail trade throughout the country is done by the small fry. Have you no subscribers among the latter class—namely, those who do business of from \$5000 to \$25,000—that we do not hear from

them, and see cuts and arrangements of their stores, which run in size all the way from 12 x 20 feet to 22 x 60 feet? Think it about time to see something in print from them.

We have also the following letter in regard to the purchase of goods:

The suggestion in a recent issue as to the retailers buying direct from the manufacturer is, I think, right to the point, but it would be difficult to do it. The extras given by the jobbers for quantities are generally so large that the retailer is tempted to load up, and the result is, as stated, a large and unsaleable stock, bills due and notes the same way. Besides, the large retailer is to all appearances placed on the same plane with the exclusive jobber in the matter of buying from the manufacturer, and hence the continuous cutting in the retail trade and eventual loss and bankruptcy. Brethren of the strictly retail trade, let us hear from you.

Arrangement of Stores.

We have received from C. T. Rosenthal, Batesville, Ark., advices in regard to a method of sampling Cutlery, for which he has obtained a patent. The accompanying illustrations, Figs. 268 and 269, illustrate

from the rear, as shown in Fig. 269, such numbers, marks and other signs relating to the quality, cost, price, &c., of the Knives can be placed. They are thus in full view of the salesman standing behind the counter but concealed from the customer in front of it. By this ingenious contrivance it will be seen that the goods are effectively displayed. The stock is kept clean and within easy reach. It is also intimated that the customer seeing but one Knife of each pattern will usually purchase the sample, thus permitting it to be replaced by a fresh one, the accumulation of shopworn goods being thus avoided.

New Mexico is probably destined soon to be developed into a prosperous State. Various extensive railway schemes are in embryo, and, now that opportunities have been discovered for irrigating enormous sketches of land, the inducements to agriculturists are attracting many settlers.

Fig. 268.—C. T. Rosenthal's Cutlery Show Case.—Front View

his method, giving different views of his Cutlery sample case, Fig. 268 showing it as seen by the customer from the front of the counter and Fig. 269 representing it as it appears to the salesman behind the counter, while at the same time it indicates the manner in which it is constructed. It should, however, be explained that the Cutlery case is intended to be used generally in a glass showcase, which is not represented in the engraving.

Fig. 269.—Details of Cutlery Case.

ings. From these illustrations it will be seen that the invention consists of a box or case with partitions, as shown. Each of the compartments thus formed is covered by an independent lid, on which after any desirable covering or finish has been given to it the sample of the Knife contained in such compartment is placed. These covers rest upon zinc-lined ways or supports, so that they run down toward the front of the case, so as to give a satisfactory view of the Knife. This construction provides, it will be seen, for displaying upon the cover a sample of the goods contained in each compartment, while on the exposed upper portions of the partitions, which are visible only

Respecting the characteristics of the country a Santa Fé correspondent says: While the climate of New Mexico may be described as everywhere mild and dry, the differences in altitude cause marked local differences in various parts, while the resources of the almost uniformly rich soil also vary materially in correspondence with the influence of the climate. The altitude gradually diminishes from north to south, from between 6000 and 8000 feet above the sea level in the northern portion for the habitable and arable regions, to between 4000 and 5000 feet in the southern parts, following the general descent of the Rio Grande and Rio Pecos. It is distinctively a mountainous country, with the unbroken chain of the Rockies descending into the northern part, below which the mountains rise from the mesas in detached groups. These mountains have the most important effect on the arability of land; were it not for these, the whole country would be almost the absolute desert it has long been reputed to be; but their summits condense the moisture and deposit it in snows on the higher peaks and in frequent rains on the slopes of all. The water breaks out in springs at their feet and descends into the plains in small streams.

By means of improved light-draft steamers with an adjustable keel adapted to shoal water it is believed that the interests of navigation on the Mississippi River can be revived, and a profitable traffic be restored. With this object the Lucas River and Ocean Ship Company have been formed at St. Louis, and a few days ago Mr. Cahill, an earnest advocate of this enterprise, addressed a public meeting, at which he stated that, while mechanics had made

wonderful strides in perfecting machinery for river navigation, there had been no change in the models used in constructing the hulls. While the Lucas ship does not contain anything new, the mode of applying the old ideas, he said, will mark an era in river navigation. The trouble at present is that we have no means of reaching Spanish-American points with cheap transportation. The gentleman claimed that the Lucas ship would cover the ground, as we would be able to load a cargo at the St. Louis wharves, and not only place it aboard the wharves of the different seaport towns bordering on the Gulf of Mexico, but would be able to enter the different rivers thereby to deliver goods to interior towns. In return the ship could be loaded with all the valuable products of these tropical countries and brought direct to the interior without reshipment. It is proposed to build one of the ships to demonstrate the practicability of the scheme.

Colorado is expecting to take rank, in a very few years, among the great manufacturing States. She claims to have all the materials that can be found in the East, with every promise of a rapid growth of population. The various industries requiring iron and coal can there find the best material in inexhaustible quantity and of the best quality. The shipment of coal eastward this year, as far as the Missouri River, will equal 500,000 tons. The wool clip in 1887 was about 8,000,000 pounds, and that of 1888 will exceed 12,000,000 pounds. The means of transportation in Colorado comprise 20 lines of railroad, and reach every portion of the State. The Denver and Rio Grande, the greatest narrow gauge system on the globe, operates over 1500 miles, its connections reaching all points abroad. The Colorado Midland, a new standard gauge road, affords transit from the center of the State to the Northwest. The systems of the Union Pacific, Kansas Pacific, Burlington and Missouri, Atchison, Topeka and Santa Fé and the Missouri Pacific all traverse the State. Within the past few weeks has been witnessed the completion of the Pan Handle route from Denver to the Gulf of Mexico, opening up to Colorado the markets of the great South.

The removal of the \$50,000 subsidy to the Australian line of steamships by Postmaster-General Dickinson causes much rejoicing in San Francisco, where it is predicted that in a very few years the line will be self-supporting. The *Commercial Herald* says: "Our commerce with the Australias is increasing at a rapid pace. It now not only employs the steamship line, but a flourishing line of clipper ships, and it will not stop where it is now by any means. For seven months of the year the imports from Australia and New Zealand have reached \$801,680; the exports, \$983,900—close on \$1,000,000. The latter in particular is very nearly equal to the whole exports of 1887, so that our trade is improving in the most desirable direction. The complete figures for the present year will far exceed those for 1887, or, we believe, for the matter of that, any other year in the history of the trade. For all this we are certainly indebted to the subsidy so liberally paid by the colonies until now. We hope that for the future we shall be able to subsidize our own vessels, if need be, with or without the aid of the colonies, whose trade we so ardently desire."

The *West Shore*, a monthly magazine published at Portland, Ore., prints a supplement illustrating and describing the charcoal furnace and the pipe foundry of the Oregon Iron and Steel Company at Oswego, Ore.

EAST INDIES.

SINGAPORE, July 11, 1888.—Tin.—Some small sales were made here at down to \$29.75 $\frac{1}{2}$ picul, but the advance in London has revived the hopes of holders, and no sellers could be found except at fancy prices. Buyers offer \$31 and under. Supplies are being kept back and shipments will again be very small. *Tonnage*.—Steamers get 27/6 @ 30/ for weight. Via canal there is no tonnage offering; via Cape the Macca Company quotes 22/6 @ 25/ for weight. For Boston the berth is vacant. *Exchange*.—is quoted 3/1 $\frac{1}{2}$ for 6 months' sight credits. The *Laertes*, a steamer clearing for New York on June 28, took 504 piculs.—*Gillfillan, Wood & Co.*

SINGAPORE, September 4, 1888.—Tin.—August shipments from the Straits Settlements to the United States amounted to 300 tons, against 750 in 1887; to England, 1800, against 1300; since January 1 they were respectively 1450, against 35,550 and 12,400, against 8800.—*Gillfillan, Wood & Co., to Charles Nordhaus, New York, per cable direct.*

PENANG, July 20, 1888.—Receipts.—Tin during the fortnight reached about 10,000 piculs, of which Europeans took 3600, while Chinese bought altogether 9000. The market opened at \$33.50, receded to \$31.55, and after touching \$33.70 closed at \$33.60. Chinese have purchased at \$33.10 to ship to Singapore August 1. Shipments hence to England since January 1 amount to 79,568 piculs; to the United States, 1854. *Gum Benjamin* has brought \$34 @ \$39 for good merchantable, *Gutta-Percha* \$60 @ \$100, and *India Rubber* \$70 @ \$75. *Exchange*.—Four months' sight Bank on London, 3/1 $\frac{1}{2}$ @ 3/1 $\frac{1}{2}$.—*Schmidt, Kustermann & Co.*

MANILA, September 4, 1888.—Hemp.—Has been quiet at \$10 $\frac{1}{2}$ picul, against \$9.25 same date last year, equalling $\frac{1}{2}$ ton, cost and freight, \$33.47, against \$33.17. The clearances for the United States since last cable amounted to 7000 piculs, against 3000 last year, and since January 1 to 109,000, against 150,000. There are loading at present for the same destination 49,000 bales, against 29,000, while there have been cleared for England since January 1 243,000 bales, against 147,000 in 1887; loading for ditto, none, against 5000; cleared for all other ports, 51,000, against 28,000. Receipts at all ports since last cable, 14,000, against 17,000; since January 1, 399,000, against 334,000 in 1887 and 272,000 in 1886. *Freight*, \$6, against \$6. *Exchange*, 3/5 @ 3/9.—*Ker & Co. to Charles Nordhaus, New York, per cable direct.*

COLOMBO, July 19, 1888.—*Plumbago*.—Is firm at the following quotations, in rupees $\frac{1}{2}$ ton: Large lumps, 145 @ 170; Ordinary ditto, 135 @ 160; Chips, 80 @ 95, and Dust, 40 @ 65. Following have been the shipments since October 1: To England 61,676 cwt.; to Marseilles, 38; to Trieste, 523; to Hamburg, 7415; to Antwerp, 3359; to Bremen, 1012; to India, 82; and to the United States 130,332—altogether, 204,437 cwt., against last year, 183,339, 145,341 in 1886, and 159,246 in 1885. *Coir Yarn*, Nos. 1 to 4, may be quoted 7 @ 12 rupees $\frac{1}{2}$ cwt. *Exchange*, six months' sight, 1/4 $\frac{3}{4}$ @ 1/4 7-16.—*Volkart Bros. through their Agent, John W. Greene, 82 Wall street, New York.*

SPAIN.

BILBAO, August 25, 1888.—*Iron Ore*.—The first week following upon our report of the 11th inst. was still a dull one, whereas last week has been lively at 7/6 @ 8/ for Campanil and 6/10 @ 7/3 for Rubios. Still the demand for shipment abroad has fallen off considerably this year thus far, in part because it appears to be less needed, and partially because the owners of some of our mines have screwed their pretensions too high all along. Total shipments since January 1 sum up 2,494,122 tons, against 2,980,677 last year. *Pig Iron*.—During the first week of the fortnight under review little transpired, shipments abroad being restricted to 320 tons, and coastwise to 1136, but last week more was done for export, especially to Italy per steamer *Cranwood*, some 3111 tons being shipped, and 575 leaving our harbor coastwise.—*Bilbao Maritimo y Comercial.*

GERMANY.

HAMBURG, September 1, 1888.—*Iron*.—Pig Iron has been dull during the week in Rhenish-Westphalia. Stocks have increased some-

what in consequence of importations from England. Production in Germany and Luxembourg in July has been 354,111 tons as compared with 326,075 tons last year, and since January 1 it has been to the close of July, 2,460,825 tons, against 2,174,556 last year. The July production was made up of 177,320 tons Forge and Spiegel; 34,095 Bessemer; 100,216 Thomas and 42,480 Foundry. There has been a resumption of English purchases of Spiegel; the orders extend all the way to the close of the year. The quotation at Siegen remains 54 marks $\frac{1}{2}$ ton for 10 to 12 % Manganese. Both Forge Pig and Bessemer have been neglected, the former at 46 @ 47 at Siegen, but Thomas has been more active. Foundry Pig Iron has been in good request and firm, the demand from foundries being large. English Bessemer has been obtainable on the West Coast at 44, an advance of 6d; Merchant is selling to a satisfactory extent at home, and the export demand also slowly revives. Structural Iron has continued lively; the demand for Beams exceeds the productive capacity. Hoop iron is less wanted. Competition among makers is on the increase. and the price now 136 to 137.50 Boiler Plates sell with as much ease as heretofore, thin Sheets less so; Siegen quotes the latter 146 to 150. Prices in the Wire branch remains firmly sustained. Machine shops are doing well, especially for the Navy. The increase of water-works in Germany causes an enormous demand for Cast-Iron Pipe. Advances from Upper Silesia continue encouraging; even in the Wire branch it is believed that a giving way in prices will be avoided. The 27 Coke blast furnaces in blast were all doing well. *Metals* are unaltered and quite firm in this market.—*Borsenhalle.*

RUSSIA.

ST. PETERSBURG, August 30, 1888.—*Petroleum*.—The annual statement of accounts and balance sheet for the year 1887 of the Nobel Brothers Naphtha Production Company has just been submitted to the shareholders. The dividend declared for last year is 6 %. The assets are composed as follows: Real estate, 12,054,510 rubles; steamships, 5,307,086 rubles; rolling stock, 2,824,000; material for manufacturing purposes, 1,355,686 in this city and 515,276 in the various entrepôts. Naphtha on hand, 2,793,282; cash, 94,126; deposits in bank, 261,636; outstandings, 2,495,441. The amounts of money held in reserve are 7,752,616 rubles. The company owe 3,468,859 rubles bonds outstanding and 22,000 shares of, together, 15,000,000 rubles.—*Journal de St. Petersburg.*

The New Navy.—The Navy Appropriation bill has received the signature of the President and has become a law. It adds four cruisers and three gunboats to the new fleet, making an aggregate of 30 vessels of various classes. We have now the four Roach cruisers, Chicago, Atlanta, Boston and Dolphin, classed as 15-knot and 16-knot vessels. We have also under completion the five monitors, which will be slow, but will carry ten-inch guns, and can be used for harbor defense. We have in course of construction three gunboats of 16 knots, the Yorktown, Bennington and Concord, and one of 13, the Petrel, besides the three of 2000 tons authorized in the current act, from which 18 knots are expected. Of the cruisers, the Charleston, already launched, and the Newark are to make 18 knots, while the Baltimore, the Philadelphia and the San Francisco and the two 3000-ton vessels of the present act are to make 19 knots. The 5600-ton cruiser in this act is to be guaranteed to make 20 knots, which is the speed of the Vesuvius, the dynamite vessel. The Herreshoff torpedo boat will go at least 22 knots. More important than any of these are the three armored cruisers, of which the Maine and Texas are building, while a third, larger than either, is now authorized. The plans for an armored coast-defense vessel are being perfected. Here are 30 vessels to form the basis of an efficient navy, and the purchase of the swift little Stilleto has made the number 31.

A destructive fire in San Francisco, on Sunday, 9th inst., caused general havoc among the iron works and involved factories, mills and other manufacturing property to the extent of \$1,000,000.

The loss of the National Iron Works is estimated at \$130,000; of the Novelty Iron Works, \$22,000 and the Columbia Foundry, \$25,000. Few particulars have been received.

Ordinance for the Army.

The conference reports on the Fortifications and Army Appropriation bills were adopted in both houses on Monday. The report on the Army bill drops all the Senate amendments for the manufacture of ordnance. The Fortifications bill, as agreed to, embodies Mr. Sayers's proposition appropriating \$1,500,000 for steel forgings, which was originally a subject of strong opposition. The Army bill, as finally agreed upon, carries an appropriation of \$24,471,300. The Fortification bill appropriates \$3,972,000. These bills had provisions for the same purpose which were inserted by the Senate, with a view to securing the appropriation in one of them if the House should disallow it in the other. The chief item so duplicated was that known as the Hawley amendment, which appropriated more than \$6,000,000 for ordnance. The substance of this amendment remains as a part of the Fortification bill, though its aggregate is reduced about one-half. Aside from the regular provisions of the Army and Fortifications bills, these measures appropriate as follows: For the manufacture of cannon and carriages, \$200,000; for testing pneumatic guns, shells, &c., \$100,000; for gun factory at Watervliet Arsenal, \$700,000, for the purchase of rough-bored steel, \$1,500,000; for submarine mines and submarine controllable torpedoes, \$200,000; for rifled mortars, \$250,000; for the purchase of tests of ordnance by the Ordnance Board, \$500,000. All but the two first named items were included in the Hawley amendment, and were especially championed in the House by Mr. Sayers, of Texas.

The Harvey Steel Company, of Jersey City, announce that they are now erecting large works at Newark, N. J., fully equipped with rolls, hammers, &c., for the manufacture of steel. The works are to be ready for general orders on all high grades of steel, January 1, 1889. During the interval they are utilizing their present works and process for the treatment of all kinds of drop dies and forgings used in pressure work, &c., and made from Bessemer steel.

W. G. Price & Co., of Pittsburgh, proprietors of the Berlin Iron and Lead Works, some time ago decided to remove their works from that city on account of excessive taxes and the high rates charged for natural gas. The firm looked at several sites at McKeesport, which is about 15 miles from Pittsburgh, but finally decided to locate at Greensburg, which is situated on the Pennsylvania Railroad, 31 miles from Pittsburgh. The citizens of that place offered the firm a free site for their works and other inducements, which have been accepted. The work of removal will begin at an early date.

Charles Frederick Herreshoff, of Bristol, R. I., died of pulmonary disease, at his home in that city, on Saturday evening, in the 80th year of his age. Mr. Herreshoff was the father of the famous Herreshoffs, the boat builders. Many of the fastest boats built by the Herreshoffs were modeled by the father.

The Chicago, Burlington and Quincy Railroad, one of the dozen largest lines in the country, has lost \$5,318,715 in net earnings for the first seven months of the current year. Strikes and a rate war have done this in equal shares.

The Lewis Lawn Mower.

The Seneca Falls Lawn Mower Company, Seneca Falls, N. Y., of which J. N. Hammond and W. P. Elwell are proprietors, are putting on the market a new lawn

voir with stem; C is the collar on side plate that holds oil reservoir; D is the axle with conical ends on which the wheels run; E is the screw that holds oil reservoir in place; F is the screw to be taken out to fill reservoir with oil. The

tractions, light and strong, and the point is made that they do not cut the lawn, and that they take a firm hold of the ground, doing away with any slipping or lost power and imparting a continuous motion to the knives, while the wheels working independently of each other, the fly keeps in motion and performs its work when the machine is run around curves. The further points made in regard to this machine are: That it cuts smoothly, runs easily, is light, strong and compact, is thoroughly built of the best materials and all the parts are made interchangeable.

Fig. 1.—The Lewis Lawn Mower.

mower which is named the Lewis, a general view of which is given in Fig. 1, a special feature of its construction being shown in Fig. 2. This is a front-cut machine, with its driving wheels worked independently of each other, in order that it may do its work up to and around obstructions. The driving wheels are in the rear of the fly, in order to avoid running over and crushing uncut grass. The axles have conical bearings and the oil

company allude to the manifest advantage of this self-lubricating arrangement as obviating the necessity of carrying oil cans on the lawn, and also the fact that it is

The first sheet of plate glass manufactured in this country is still doing duty in

Fig. 2.—Self-Lubricating Device.

reservoirs are provided with stems with flaring mouths, in which fit the conical bearings of the axles. An important feature in the construction of the machine, and one which the manufacturers emphasize as embodying special advantages, is the fact that it is self-lubricating, the axles both of the driving wheels and of the cutting cylinder or fly running on centers in adjustable boxes that have a self-feeding oil chamber. The details of this part of the machine are shown in Fig. 2, which gives a longitudinal section through the axle and oil reservoir. This construction will be readily understood; A is the side plate of the machine; B is the oil reser-

not necessary in the use of the machine to stop work for the purpose of oiling it. They also emphasize the point that these self-oiling boxes are adjustable, so that the wear can be taken up. It is also to be observed that the driving wheels are open

the show-window of a store in New Albany, Ind. The glass was made by Capt. J. B. Ford, at the plate glass works of that city, when he was operating them. He was called the pioneer of plate glass manufacturing in America.

The Lawrence Solid Back Perfect Comb.

The Lawrence Curry Comb Company, 204 and 206 East Forty-third street, New York, have recently put on the market a new curry comb, which is represented in the accompanying illustration. It is designated as a solid back perfect curry comb. Special attention is called to the fact that it is made of steel, and is the only steel Perfect comb on the market. It is made six or eight bars of heavy steel, with steel wires, tinned rivets and knocker and enameled handles. It is made also in iron. These combs are referred to as very strong and durable and of attractive and convenient pattern, while the prices at which they are offered deserve the attention of the trade.

Chamberlain, Wheeler & Co., Columbus, Ohio, announce that Mr. Cartwright has removed to St. Louis to represent their interest in the office recently opened in that city. Mr. Wm. C. Hayward will succeed Mr. Cartwright at their office at No. 58 Dearborn street, Chicago. Their brands are Gore, Norway, Crown, Akron, Bessie, Winona, Sheffield, Jefferson (Cold blast) and Pencost Ferro-Silicon.

The Lawrence Solid Back Perfect Comb.

Humphrey's Cavity Plane.

The Humphrey Tool Company, of Warren, Mass., are directing the attention of

the Atchison, Topeka and Santa Fe, and Mr. Strong appears satisfied that a speed of 70 miles per hour can be attained between Chicago and Kansas City

Fig. 1.—Tool Arranged for Use with One Hand.

woodworkers to a very neat and convenient plane, which they are offering in three sizes of each style shown in the accompanying engravings. Fig. 3 presents a general view of the plane, showing the handles with and without tips. The center piece of the tool, holding the knife or cutting blade, is of metal, while the handles are of wood. The knife, which is of fine tool steel, is firmly held in position by screwing up one or both of the handles, or it may be done by removing the tips from the ends of the handles and inserting them in place of the handles, thus securing a very short tool. There are no set-screws or other projections, and the whole tool is constructed with a view to using in close places. As will be seen by reference to Fig. 3 of the engravings, the handles are slightly offset to enable the operator to employ the tool in surface-

when the engine in question is employed to haul the trains. As regards the Strong locomotive No. 444 on the Lehigh Valley

Fig. 1.—Champion Tire Shrinker.

Road, to which we have had occasion to refer several times in these columns, it may not be without interest to note that

and works equally well on light steel tire and on wagon tire 4 x 1 inch. When the machine is not being used the handle can be taken out of the socket. The floor space occupied by the tire shrinker is 18 x 10 inches and its weight is 130 pounds.

Fig. 2.—Short Tool for Use where the Handles would be in the Way.

work. In Fig. 1 is shown the plane with the handle at the left removed, making it a right-hand tool. In order to adjust it for use in this shape it is only necessary to remove one handle and screw up the other. For a left-hand tool the reverse operation is necessary. In order to make such a tool as is indicated in Fig. 2 of the cuts, take off one of the handles, and, using it as a screw-driver, remove the tip from the opposite handle and insert it in the place occupied by the handle removed. Then take off by the same process the other tip and insert it at the opposite end. Set the blade well back and tap it down to the required cut, after the handles are well screwed up. The manufacturers claim for this tool that it permits of working on short curves and plain surfaces; that the various adjustments are easily and quickly made; that it cuts clear and in every way satisfactorily.

A locomotive with the Strong valve gear and boiler is now nearly completed,

owing to the defective manner in which the seam between the combustion cham-

ber and furnaces was made, the enginesmoother, steadier and make less noise than ordinary belts. They are adapted to high-speed dynamos, especially those of alternating current system. Chas. A.

Fig. 3.—Humphrey's Cavity Plane.—Two Styles—with and without Tips to the Handles.

and will shortly make some experimental runs upon the New York and New England. The engine was built for

seam was subsequently adopted, and the engine is now at work on the Lehigh Valley hauling heavy passenger trains.

The Champion Tire Shrinker.

The cuts herewith given represent this article, which is manufactured by the Champion Blower and Forge Company, Lancaster, Pa. Fig. 1 represents the shrinker ready for use, while Fig. 2 indicates the method of its operation, showing it in use. The company explain that all that is necessary to operate the shrinker is simply to place the tire under the clamps, when by the least stroke of the hammer they drop over their center and lock firmly on the tire, when with but little pressure on the handle the tire can be shrunk as desired. The simplicity, durability and efficiency of this shrinker are mentioned, and it is claimed that it is managed by one man with perfect ease

Perforated Leather Belting.

We illustrate, in the annexed engraving, a novel method of preventing "air cushions" in belts run at a high rate of speed. The perforations are made in a regular and uniform manner and at equal distances apart over the entire surface of the belt, thus insuring, it is claimed, equal tension and leaving the tensile strength of the belt uninjured. Besides preventing "air cushions," these belts are said to run

Fig. 2.—Champion Tire Shrinker in Use.

Perforated Leather Belting.

Schieren & Co., of New York, have just completed the machinery necessary for the manufacture of the belting.

THE IRON AGE

THURSDAY, SEPTEMBER 20, 1888.

The Harlow Automatic Lubricator.

A new form of lubricator, ingenious in construction, and positive and automatic in action, is at present being put on the market by Mr. Amos Aller, 109 Liberty street, New York. The engravings which we publish on this page, representing both general and sectional views, clearly explain

cup is filled with oil, and the quantity to be taken from this reservoir and delivered to any part of the machine to be lubricated, is determined by the use of the numbered wheel at left. This is more clearly shown in the vertical section, Fig. 2, the wheel there being marked A.

In Fig. 2 the outlet valve is marked D; F is a strainer over the suction chamber

cap; P, valve chamber; Q, nut and spring in lower part of valve chamber; R, valve; V, nipple, to screw into steam pipe.

Being operated by some moving portion of the engine or machine to be lubricated, the Harlow lubricator starts and stops with the engine or machine being lubricated, without requiring attention from the engineer or operator. The oil is fed to any

Fig. 1.—General View of Lubricator.

Fig. 2.—Vertical Section.

Fig. 3.—Vertical Section of Sight Feed.

Fig. 4.—Enlarged View of Suction Chamber.

THE HARLOW AUTOMATIC LUBRICATOR FOR LOCOMOTIVE, MARINE AND STATIONARY ENGINES.

the arrangement of the device and its method of working.

An examination will show that the lubricator is practically a pump, worked through a rack and pinion combination, B C, seen in Fig. 2. The rod A in Fig. 1 receives its motion from some moving portion of the machine to be lubricated, and conveys this motion to the pump plunger within the reservoir cup. As the lever to which the rod is attached is hung on an axle, the rod may be carried to any desired angle to receive its motion. The reservoir

and U represents the suction port; H is a removable base. An enlarged view of the suction chamber is given in Fig. 4. In Fig. 3 we show a vertical section of the sight-feed, which, we need perhaps scarcely remark, is fitted in between the exit-pipe of the lubricator proper and the point at which the lubricant is to be delivered. The engraving explains itself, though, to be more explicit, we add the following reference letters: J, valve stem; K, union; U, packing for glass tube; MM, lock nuts; N, base, holding glass tube; O,

desired spot in perfectly regulated quantities, either in small drops at frequent intervals, or in large drops less frequently, or the oil may be delivered in a nearly continuous stream, at the pleasure of the operator. This regulated supply not only insures economy in oil, but gives an even, perfect and continuous lubrication. Any oil, thick or thin, if free from grit, may be used. The cup can be filled at any moment while the engine or machine being lubricated is in operation, without causing any leak either of oil or steam.

The device is not affected by varying temperature, and can be used in the most exposed situations without danger of freezing, as there is no water used in or about it. Its different parts are all made to gauges, so that in case of breakage they can be easily and quickly replaced.

Industries of Providence, R. I.

The Franklin Machine Company, better known as the old Franklin Foundry, has nearly completed the first of an order of five web perfecting printing presses, which is a new departure for these works, and, so far as known, for any machine works in this city. The work is being done for the Duplex Printing Press Company, of Battle Creek, Mich. The machine, which is 21 feet long and 4 feet 6 inches high, is intended to print 32, 64, 128 or 256 page pamphlets, fold, wire-stitch and cover them at a speed, for the smaller number of pages, of 80,000 copies per diem. In the stitching and covering alone one of these machines supplants over 100 girls, who did the work by hand. All the presses made by the Duplex Company have for their groundwork the inventions of the late Joseph L. Cox, and they bear his name. The new press appears to be quite simple. It has but one plate cylinder, flanked on either side by an impression cylinder of equal diameter. The paper is fed from a roll on a standard near the floor, and, as in the Bullock press, is cut before entering the machine. After having one side printed, the sheet, which entered on the right, is carried by tapes over the top of the press to the extreme left. Here it is carried down slightly until what was the rear edge is seized by the grippers of a platen cylinder and is presented to the plate cylinder at another part of its revolution, and the second side is printed. The sheet then goes off into a folder with adjustable guiding throat and double delivery, and is then folded as many times as may be desired, and stitched with steel wire. Another attachment still, in the form of a supplementary press, will print a cover and insert it at the proper place, to be finished up and folded with the pamphlet.

Mr. John H. Brown, a former resident of this city, has for the past eight years been at work perfecting a machine for the economical decortication of the fibers of tropical plants, valuable to the textile and paper making industries, and now has his machines in successful operation.

The Board of Assessors have completed a revaluation of city property, consisting of real and personal estate. The total is \$186,753,700, of which \$85,837,840 is personal, the increase over the preceding year's valuation being \$2,731,980. Among the persons and corporations taxed for more than \$50,000 are the following:

American Screw Company.....	\$1,048,520
Armington & Sims Engine Company.....	89,200
Amos C. Barstow and wife.....	534,080
Barstow Stove Company.....	94,960
Boston and Providence Railroad Company:	
Core street station.....	\$380,180
India Point station.....	141,580
Brown & Sharpe Mfg. Company.....	521,760
Builders' Iron Foundry.....	376,940
City Machine Company.....	127,940
George H. Corliss estate.....	59,960
Corliss Steam Engine Company.....	100,000
Franklin Foundry and Machine Company.....	397,520
William H. Harris Steam Engine Company.....	121,000
Household Sewing Machine Company.....	75,060
New England Butt Company.....	273,560
New York and New England Railroad Company.....	105,260
New York, Providence and Boston Railroad Company.....	164,120
Nicholson File Company.....	464,640
Phenix Iron Foundry.....	199,960
Providence Machine Company.....	153,500
	167,080

Providence and Worcester Railway Company.....	613,620
Rhode Island Locomotive Works.....	365,120
Slater Mill and Power Company.....	148,000
Thomas J. Hill.....	255,720
Rhode Island Tool Company.....	151,720

Mr. Benjamin Easton, Jr., Sheriff of Newport County, who, about two years ago, purchased the coal mine property in Portsmouth, R. I., but for agricultural rather than for mining purposes, is negotiating for the sale of the property to the Worcester Steel Works, who propose to utilize the mine. The mine has been abandoned for a number of years as impracticable to be profitably worked. The coal is not good for home consumption, but is considered of fair quality for smelting purposes, and it is for this purpose that the Worcester Steel Works propose to use it. They intend to begin at once, upon the completion of the purchase, the work of pumping out the mine, which will consume considerable time, as it has been abandoned so long that the shafts are practically filled up. It is possible that the company may transfer their works to the neighborhood of the mine, which would seem to be a more advantageous plan than the shipping of the coal mined to the present location of the works at Worcester. The sale is expected to be consummated in a few days.

Two of the railroads running into this city have introduced, to some extent, an improvement which, while it may not be noticed by one passenger in a hundred, nevertheless contributes to his comfort in a marked degree, and is a measure of safety and even of economy in the long run. It is probably known to all who use the railways that passenger cars are now coupled by what is known as a vertical plane drawbar, which has taken the place of the loose link and is now required by law in most States. This, with the accompanying buffers, makes a train practically solid, there being no slack between the cars to cause shocks in stopping and starting. The same reasons which dictated the close coupling between cars obtain with even more force in regard to the coupling between the tender and the head of the train. Some of the engines now working the Providence division of the Old Colony are from the company's former equipment and have the Miller coupler-hook on the back end of the tender, the same as on the cars, save that it is uncoupled by means of a hand wheel in place of the customary lever. The New York, Providence and Boston road has a hook-coupler handled by a small lever.

Some of the numerous inventions of the late George M. Cruickshank, of this city, are worthy of more than a mere mention. While it is generally known that he ranked high as a machinist it is probable that many, even those familiar with his line of business, never knew the fertility of his mind and the variety of his inventions. He was certainly one of the leading mechanics of New England, and his name was familiar in nearly every country in which steam is used for industrial development. His whole life was spent in the study of machinery, and it was said of him that he was able not only to understand the most intricate piece of mechanism, but also to suggest improvements, practicable and valuable. The peculiar ability was known and recognized throughout New England, and much of his time was spent in consultation with manufacturers, who seldom if ever were disappointed in obtaining the remedies solicited.

George Cruickshank was a born mechanic. He and his brother David came to this country in the hope of finding an enlarged field, and in less than five years after arriving in the United States George Cruickshank patented an invention which was immediately recognized as one of value by the engineers of both continents. While foreman of the Hope Iron Works he hit

upon a plan for doing away with hemp packing secured around the piston-rods of steam engines. In March, 1871, he introduced his "metallic packing," a contrivance as simple as it was effective, and 17 years of use have proved its incomparable superiority over the old method. It consisted of two rings, each cut into four segments, which fitted tightly to the piston-rod as it moved through them. The wear was taken up by spiral springs between the segments and an outside brass case. Power was gained by the lessening of friction, and when the rod vibrated the packing accommodated itself to every change of position.

Mr. David Cruickshank, now in business at 243 Dyer street, was then in Boston, working for the Fitchburg Railroad. At the request of his brother he came to Providence, to help put the improved packing on the market. It was first manufactured at the Hope Iron Works, but in January, 1872, the brothers leased Charles A. Mann's shop on North Main street, and formed a partnership under the name of William R. Smith & Co. George held the foremanship at the Hope Iron Works until June, 1872, when, his health failing, he went to join Mr. Smith in Europe, to see to the disposing of patent rights in Great Britain, leaving David in charge of the North Main street manufactory. He returned in October, and the following month they hired a room in the east end of the Dyer street building occupied by George at the time of the fatal accident. The plant was enlarged and the firm name changed to George M. Cruickshank & Co. In May, 1875, Mr. Smith withdrew, while David sold out his interest to George in the spring of 1880. But it was by the Shipman engines that Mr. Cruickshank was best known, and it can be said that his reputation was world-wide soon after he began their manufacture. Shipman was a Rochester (N. Y.) mechanic, who conceived the idea of generating steam with oil for engines of light power, but his plan, while possessing merit, was not well developed. Mr. Cruickshank followed up the idea, and produced a boiler that answered every requirement. For the first time oil was successfully used instead of coal under a boiler, and a brisk export trade followed the completion of the engine. Orders came from Australia, New Zealand, Argentine Republic, England, Germany, France, Sweden, Norway and Austria. A company was organized in Boston in 1885, and for a time Mr. Cruickshank was president, but soon resigned. The Shipman engines are used with good results on small river boats and in manufacturing establishments whose machinery could be run with 6 horse-power or less. The late George H. Corliss invariably sent applicants for smaller engines than he built to Mr. Cruickshank, and recommended the engines of the latter as the "best slide-valve engines in the world," an indorsement which was often accompanied by the opinion that the Dyer street machine-maker ranked among the most skilled and useful of American mechanics. LEONIDAS.

Professor Kolrausch has recently estimated the quantity of electricity in a flash of lightning. He finds that from 7 to 85 flashes would be required to keep an ordinary incandescent lamp alight for an hour.

In the race to Edinburgh last month some of the best running was performed on the North-Eastern Railway, England, by the compound engines designed by Mr. Worsdell. The engines in question have driving-wheels 6 feet 9 inches in diameter, with a high-pressure cylinder 18 inches, and a low-pressure cylinder 26 inches in diameter by 24-inch stroke.

The Mason Ingot Manipulator.

Among recent improvements in the steel works of the Bellaire Nail Works, at Bellaire, Ohio, is the establishment of an ingot manipulator, designed by Mr. Orland P. Mason, and serving the purpose of turning the ingot on the table and moving it into the desired position. The engravings which we present on this page explain the main features of the machine, which, it will be understood, is used in connection with a two-high mill.

In the rolling operation the ingot is fed to the rolls by means of tables having driven rollers on which the ingot lies, and by which it is moved backward and forward as it is passed to and fro through the rolls. During the operation it is frequently

the piston-rod I of the hydraulic cylinder is supported on grooved rollers, K. The operation of the machine scarcely requires explanation. The ingot having been placed on the rollers C is manipulated in the usual way until it becomes necessary to turn it. The rollers then bring it to a position which will enable it to be moved by the arms F. Steam or water is let into the cylinder J, moving the rack forward and turning the shaft D. This causes the arms F to catch the piece on its lower corner and turn it over. After turning, if it is desirable to move it still further, the rotation is continued in the same manner, and the piece may be moved to any desired position upon the table.

The machine is simple in construction, and, within certain limits, appears to be

vention and failure to patent. But as a matter of fact Jablochhoff had, as early as 1876, plated the carbons of his candles with copper; and though the invention had prior to that time been patented in France by Reynier, Jablochhoff disdained to recognize the Reynier patent, depending upon prior patents and publications; and it appears that Jablochhoff was right, since the Reynier patent was subsequently voided by the French courts, and held to be anticipated by a prior Carré patent and by Van Malderen's work in 1868. Bouliguine and Tchikoleff, also in Russia, plated their carbons, and published accounts of their practice.

The history of this feature of electric lighting is closely paralleled by many other features; and all other branches of

Fig. 1.—Side Elevation.

Fig. 2.—End Elevation.

Fig. 3.—End Elevation.

Fig. 4.--Plan.

INGOT MANIPULATOR AT THE BELLAIRE NAIL WORKS, BELLAIRE, OHIO.

necessary to turn the partially worked piece on its edge, and also to move it from one side of the table to the other. In case of a blooming mill making a variety of sizes, this work has always been done by hand. By Mr. Mason's arrangement this is accomplished by power.

The machine embraces a horizontal shaft, D, extending under the table rollers at right angles with the rolls. On this shaft five to seven arms, F, are placed, about 6 feet long. The shaft is revolved by a pinion, G, and rack, H, driven by a hydraulic cylinder, J. The arms F are curved on the upper side, and when revolved the points come up under the ingot and turn it over. A further revolution moves it into the desired position. The length of stroke of the hydraulic cylinder is such as to allow the shaft D, with its arms, to make one complete revolution. From Fig. 1 it will be noticed that the arms extend upward between the rollers C C. The rack H which is attached to

effective. Its economy consists in dispensing with the labor of two to three men on each turn. The principle appears to be correct, and only needs the trials of experience to perfect it.

Coppered Carbons.

Probably nearly every electric arc lighting company now electroplate their carbons. The *Electrical Engineer* says that in the dark ages of 1879 there was an interference in our much abused patent office between the two well-known inventors, Charles F. Brush and Moses G. Farmer, in relation to the coppering of electric light carbons, and it was held by Paine, commissioner, that Farmer had invented the process in controversy before Brush, but had also abandoned it, so that while priority was therefore awarded to Brush *pro forma*, the invention was thrown open to the public by Farmer's prior in-

applied electricity likewise disclose similar instances of anticipation. Electric lighting, however, is so old an art in itself, although commercially young, that inventors in this field cannot go far without running foul of something which had been invented (though very likely not much employed) years before.

Pictet's New Ice Machine.

One of the objects creating considerable attention at the Jubilee Exhibition at Vienna, is the new ice machine devised by M. Pictet, of Geneva, who has come to Vienna to personally superintend his exhibit and introduce this machine in Austria. In general principles the machine does not differ from others, but there are some important modifications in detail. Instead of using sulphurous acid, as in his previous machines, M. Pictet uses a mixture of sulphurous acid and carbonic acid,

to which we referred at greater length about a year ago, and which has received the name of "liquide pictet." The boiling point of this liquid under atmospheric pressure is at -19°C . and at a temperature of $+50^{\circ}\text{C}$. the pressure of the gas is only half that of pure sulphurous acid. The inventor has some theory, according to which there takes place an actual chemical combination of the molecules of the two gases when they are being liquefied under pressure, and it is due to this property that the work expended in compression is much smaller than in any other working agent. The "liquide pictet" is not inflammable, and can even be used for the extinction of fires. It has the further advantage of leaving a greasy dew upon the surfaces of the cylinder, piston-rod, valves, &c., rendering special lubrication unnecessary. The generator consists of a system of seamless copper pipes communicating with a chamber, at the bottom of which the liquid enters, while the gas is drawn off from the upper part. The arrangement of pipes is such as to facilitate an efficient circulation throughout the whole of the generator. The pump is provided with clack valves, but to avoid the risk of breakage each valve is controlled by two springs, one pressing it down on its seat, and the other acting as a stop when it rises.

Edison's Phonograph in England.

The expectation that Mr. Edison's phonograph would soon be rendered "loud-speaking"—capable, that is to say, of communicating its message to several hearers at once, without the intervention of tubes extending from the instrument to their ears—has already been abundantly fulfilled, according to the *London Times*. Colonel Gouraud received a large party of visitors recently, in order to exhibit to them the second instrument which he has received from America, and which, being furnished with a sort of speaking trumpet, from which its sounds issue, is distinctly audible to a large group of persons. It was accompanied by a set of cylinders carrying the traces of much talking, as well as of much vocal and instrumental music, and all these, when they were put into the machine, yielded up their record with truly marvelous fidelity. One cylinder had been impressed with the habitual noises of Mr. Edison's workshop, and the listeners were entertained by a succession of sounds produced in the first instance on an anvil, with sandpaper, by a sounding telegraph and in various other ways too numerous to mention. Another cylinder addressed the company in Mr. Edison's name and in his voice, while a third yielded up a song from Faust, and a fourth, "The Barefooted Friar," the traces upon all these having been made in America. Mrs. Shaw, the lady who is widely known as "La Belle Siffreuse," was among the company, and, after she had whistled to a cylinder, the phonograph was made to reproduce her notes with astonishing accuracy, and, presumably in consequence of the more intense character of the vibrations, much more loudly than those of speech or song.

Engine and Boilers of an Old Warship.

The *London Engineer* in a recent issue published a number of interesting engravings showing the arrangement of engines and boilers fitted on board the British warship *Terrible* in 1842:

The *Terrible* was the most powerful warship at that date. She was 1847 tons burden, with a length between perpendiculars of 226 feet and a breadth of beam of 42 feet 6 inches. The engines were of 500 nominal horse-power, and worked up

to about 2000 indicated power, with a pressure of steam of 7 pounds per square inch, the engines making 15 to 16 revolutions per minute. There were four cylinders, 72 inches diameter, with a stroke of 8 feet. The boilers were double-ended tubular boilers placed across the vessel and fired athwartships. They were four in number, two being placed forward and two abaft the engines; these were the first tubular boilers of large size that were fitted in an Admiralty vessel. There were in all 24 furnaces, with an area of fire-grate of 437 square feet, and 3360 tubes $2\frac{1}{2}$ inches diameter and 5 feet long, the boilers having altogether a heating surface of 12,700 square feet; each boiler weighed 26 tons. About the time that these engines were fitted a demand had arisen for engines of a lighter description than the old side-lever engines and that would occupy less space in the vessel. Among the different types that came into use at the time engines of similar description to those of the *Terrible* were among the most successful, and between the years 1841 and 1851 55 sets of these engines were fitted into vessels having a total power of 48,000 horses. The *Terrible* was always looked upon as a most successful vessel. Her sea qualities were fully tested during the fearful gale at Balacava on October 25, 1854, when the steamship *Prince* and so many other vessels were lost. On that occasion the *Terrible* towed a line-of-battle ship out of the Bay in the teeth of the gale into a place of safety. The type of engines built for and fitted in the *Terrible* was largely employed in the Italian, Russian, Spanish, Turkish and Danish navies, as well as the British.

Professor Clausius.

Germany's foremost physicist, Dr. Rudolph Julius Emanuel Clausius, died on the 24th and was buried on the 27th ult., at Bonn, on the Rhine. From the *London Engineer* we extract the following brief biographical sketch:

Dr. Clausius was born at Cöslin, in Pommerania, on the 2d of January, 1822, and finished his academical studies at Berlin, where he also began his teaching career as private tutor at the university, and was at the same time lecturer on physics at the Artillery College. In 1855 he was called as Professor of Physics to the Polytechnic school at Zürich, and was then installed there, in 1857, to the chair in the same science at the University. In 1867 he returned to his fatherland as professor at Würzburg, and lastly he joined the corps of professors at the Fried. Wilhelm University at Bonn, where he became one of its most distinguished ornaments. As an authority and teacher on the subject of heat he took a prominent rank. Clausius was the first to confirm and place the crude discoveries on the theory of heat promulgated by Dr. Mayer, of Heilbron, on a rigidly scientific basis in his treatise on the mechanical theory of heat, completed in two volumes in 1864 to 1867, the foundation of which he had laid at Zürich in 1857 in his popular treatise entitled "The Nature of Heat Compared with that of Light and Sound." Besides the above works he wrote the two books, "The Potential Function and the Potential" and "Concerning the two Chief Propositions in the Mechanical Theory of Heat." Most of our readers are so well acquainted with the important works of Clausius that it is unnecessary in announcing his loss to do more than to remind them of how great a part he took in building up the modern notions concerning the dynamical theory of heat and its convertibility into work. The deceased was a member of many scientific societies, both in his own and foreign countries, and was decorated with several royal orders. His manner of teaching was as exact as the

science he professed—firm and methodical—and he was popular for all that, among the students and his colleagues, and his loss will be for a long time felt as leaving a gap in his science not so easily filled, as he was a great master of the science he had taken up.

Weight of Torpedo Boats.

In a first-class torpedo boat, 135 feet long, with engines of 1400 I. H. P., as built for the British Navy, the general distribution of weight is about as follows:

	Tons
Hull and fittings.....	40
Machinery.....	34
Armament.....	8
Coal.....	10
Stores, equipment and men.....	12
Displacement.....	104

In a second-class torpedo boat the total weight would be distributed as follows:

	Tons
Hull and machinery, including water in boiler.....	9.25
Coal.....	1.50
Stores, equipment and men.....	1.75
Displacement.....	12.50

Tinning by Simple Immersion.—A method of tinning by simple immersion is described by *L'Écho des Mines et Métallurgie*. Argentine, it says, is a name given to tin precipitated by galvanic action from its solution. This material is usually obtained by immersing plates of zinc in a solution of tin containing 6 grams—about 90 grains—of the metal to the liter—0.88 quart. In this way tin scrap can be utilized. To apply the Argentine according to M. P. Marino's process, a bath is prepared from argentine and acid tartrate of potash rendered soluble by boric acid. Pyrophosphate of soda, chloride of ammonium, or caustic soda may be substituted for the acid tartrate. The bath being prepared, the objects to be coated are plunged therein, first having been suitably pickled and scoured, and they may be subjected to the action of an electric current. But a simple immersion is enough. The bath for this must be brought to ebullition, and object of copper or brass or coated therewith may be immersed in it.

The skin plating in many torpedo boats is only $\frac{1}{16}$ inch thick, and protective measures against even slight corrosion must therefore be rigidly enforced. Securing phosphor bronze plates to the steel frames has been tried as a protection for the bottom plating, but on the whole an efficient inspection system has been found most satisfactory. According to the British Admiralty regulations all boats in use must be docked for inspection every two months, and in addition the decks are covered with a specially prepared cement.

The call for draft regulators on locomotives shows that the old practice of throwing open the fire-box door when an engine was making steam too freely is no longer satisfactory. A nozzle that will make an engine steam freely while working hard and slow will exert very little effect on the fire when the engine is passing out a small volume of steam expanded down toward the atmospheric line. On the other hand, when the nozzle is made small enough to cut the fire when the engine is working light, it will tear the fire when working slow. Air openings have, therefore, been applied to the bottom of the smoke-boxes, and with good results. They are covered by sliding plates, operated from the cab. The device is easily worked and there is almost no danger from the escape of sparks through the openings.

Forty-Ton Shear.

We take pleasure in presenting on this page an engraving of a large shear built by Messrs. B. W. Payne & Sons, of Elmira, N. Y., for the Elmira Rolling Mill Company, and now in regular work. The

as guides for the shear ram. The eccentric shaft is 10 inches in diameter at the ends and 14 inches through the eccentric, and carries a large gear-wheel shown at the right in the illustration. It will be observed that the machine is double geared, being driven from the back shaft which

The shear weighs about 40 tons, and has a capacity to shear plates $2\frac{1}{4}$ inches by 36 inches.

For the first time in some months there is a scarcity of cars in the Connellsville coke region. The outlook for relief in the

FORTY-TON SHEAR, BUILT BY MESSRS. B. W. PAYNE & SONS, ELMIRA, N. Y.

design is at once suggestive of great solidity and strength, the tool being intended for heavy work, and the various parts accordingly being of massive proportions. A very heavy base is provided, from which rise four wrought-iron columns, 7 inches square. Those support two massive boxes, which, in turn, carry the eccentric shaft. The columns also serve

carries the heavy balance-wheel at the left. The ram, mentioned above, carries the upper shear blade, while the lower one is fastened to the base. The sides of the ram have adjustable gibbs, which are fitted accurately to the square columns and serve the purpose of maintaining perfect alignment of the ram as it is carried up and down. A 12-inch belt supplies the power.

near future is not good, in view of the fact that shipments of corn will commence in a short time. This will necessarily divert a great many more cars, and it is expected the consequence will be an advance in the price of coke. The yards in the region are now being stocked up, and it is impossible to get cars to move the product.

Aluminium Alloys by the Heroult Process.

The Swiss Metallurgical Company, of Lauffen-Neuhausen, Canton Schaffhausen, Switzerland, is engaged in successfully producing alloys of aluminium on a large scale, making use of the Héroult patent process. This process, according to the *Engineering News*, consists in melting down certain refractory metallic compounds by the electric current and with the aid of certain electrodes, and in subsequently reducing the metals contained therein by electrolysis. The negative electrode is here the metal to be alloyed to aluminium, as copper, iron, tin, the positive electrode being the carbons immersed in the molten alumina.

The current is supplied by two dynamos, each of 6000 amperes and 20 volts, driven by a 300 horse-power Jonval vertical turbine, while a separate dynamo of 300 amperes and 65 volts is used as an exciter. The main difficulty to be overcome by the projectors of these works was the production of a current powerful enough for the work to be performed. The enormous dynamos designed for this purpose were constructed at the Oerlikon machine works, Switzerland. They make but 180 revolutions per minute. The magnetic field, having six poles, consists of a single casting weighing 11 tons for each machine. The armature used is constructed on the Brown patent design. Each machine is furnished with two large collectors and contains not less than 72 brushes. Copper cables of the size of a man's arm serve to conduct the current from the dynamos to the furnace.

The melting takes place in a crucible, or basin, of electrical carbon surrounded by a metallic wrapping into which the current enters (negative pole), the basin thus forming part of the circuit. Metallic copper, broken up into small pieces is first placed in the basin, which is then covered up by means of plates of graphite, care being taken to fill up all open joints with powdered charcoal. In the center of the graphite cover, a space is left for the introduction of the suspended carbon slabs to which the positive cable is affixed. The carbons are then lowered toward the copper, which is soon melted by the current passing through it. Alumina is now added to the copper through locks arranged for that purpose, while the carbons are somewhat raised. The current passing through the alumina melts and reduces the same, the oxygen burning the carbon and escaping as carbonic oxide gas, while metallic aluminium becomes alloyed with the molten copper. By drawing back a carbon stopper, the contents of the basin may now be emptied out into a ladle or ingot. The basin is then recharged after the manner above described, making the process a continuous one.

As mentioned above, the position of the carbon slabs in the basin requires to be regulated according to the resistance. This may be accomplished by an automatic device in the form of a chain holding up the carbons and is connected with a reversible dynamo-electro motor regulated by the amperemeter. The intensity of the current found to be best adapted for the process is 12,000 to 13,000 amperes, the electro-motive force being from 12 to 15 volts, though it was found that the output of the dynamos could be easily increased to 25,000 amperes without causing any disturbance to the same. The same process may be followed for obtaining all other alloys of aluminium, excepting those metals which become volatilized at the melting point of aluminium. Mixed alloys, too, may be directly produced by this method—i. e., copper, silicon and aluminium, by melting down clay containing silica as well as alumina.

The capacity of the plant above described is stated to be 660 pounds of aluminium per day, or 6600 pounds of bronze containing 10 per cent. of aluminium. The heats may be continued day and night for months without stopping. A series of tests, made by Professor Tetmajer, of the Polytechnikum at Zürich, illustrating the high tensile strength and ductility of the products of these works, will be of general interest to our readers:

Metal.	Tensile strength (in pounds per square inch).	Elongation (per cent).
Aluminium bronze "A".....	49,200	25.4
" " "B.....	54,600	27.4
" " "C.....	51,760	34.3
" " "D.....	68,200	37.5
" " "E.....	73,380	39.2
" " "F.....	79,630	23.0
" " "G.....	88,300	18.5
" " "H.....	91,000	7.0
Aluminium Brass.....	68,400	20.7
* Gun steel.....	78,200	14.0
* Wrought iron.....	54,000	22.0
* Delta metal.....	54,000	20.0
* Common bronze.....	32,700	8.0
* Phosphor bronze.....	41,240	17.0
* Manganese bronze.....	41,240	17.0
* Durala metal.....	51,200	22.0

* The tests marked thus * were made by Professor Tetmajer for the purpose of verification.

Fast Time on American Railroads.

The liveliest interest was manifested by railroad men in the account of the recent race between the Flying Scotchman and the West Coast Flyer from London to Edinburgh, in which 400 miles were covered by the winner in 7 hours and 25 minutes. This was an average of something over 53½ miles per hour. The New York Times referring to the event at the time said:

There was a general jogging of memories and overhauling of the records of fast railroad trains on American lines. And much comfort was found by many in going over those records. For they show that although the British and French roads admittedly make much better time habitually than is made on any of the American lines, some astonishing and sustained rates of speed have been attained here, when special efforts were expended with that end in view. The best run on record in this country which can be fairly compared with the English run was made over the West Shore Road from Buffalo to New York on July 9, 1885, when 426 miles were covered in 7 hours 27 minutes. Quite a large number of railroad men, including officials of the Baltimore and Ohio, Wabash, Grand Trunk, and West Shore roads happened at Buffalo together en route for New York. It was decided to see how quickly they could move over the new road. At the start the railroad men had their watches out, and soon the mile-posts were flying past every 43 seconds. That speed was held so steadily that the greater part of the run was made at the rate of 45 seconds to the mile, or from 70 to 83 miles an hour. From East Buffalo to Genesee Junction, 61 miles, took 56 minutes; from East Buffalo to Newark, 93.4 miles, 97 minutes; from Alabama to Genesee Junction, 36.3 miles, 30 minutes. The 97 minutes to Newark included stops of 9 minutes, making the actual running time for the 93.4 miles, 88 minutes. From Newark to Frankfort, where the conditions for running were not so good as before, the run of 108.3 miles was made in 134 minutes, including 17 minutes for stops. From East Buffalo to Frankfort, 202 miles, the time was 240 minutes, of which 35 minutes were consumed in stops. There was only a single track at that time on the road a good part of the way between

Buffalo and Syracuse, and that journey had to be made at reduced speed, especially over the switches. The journey was timed with the utmost care for the purpose of tabulation. In the table there are marked several miles which were made at the speed of 78 miles an hour, one at 84 miles, and the next, between Genesee Junction and Chili, at 87 miles. New engines took the train at Buffalo, Newark, Frankfort and Coeymans.

On October 8, 1885, over the same road, a burst of speed was tried for 11 miles, between Genesee Junction and East Buffalo, to satisfy Superintendent J. E. Layng, who was on the train. The run occupied 512 seconds, an average rate of 74 miles an hour. Three of the miles were made at the rate of 80 miles an hour, 1 at 77, and 1 at 75. On the New York Central Road a newspaper train with two cars, weighing 60 tons, hauled into Syracuse, Sunday morning, August 8, 1886, at 10 o'clock, an hour late. The train was booked to go from New York to Buffalo in 9½ hours. Orders came to try to make up the time on the further run of 148.7 miles to Buffalo. John W. Cool, one of the best engineers on the road mounted his cab, bound to obey the order. He started out at 54½ miles an hour. At the end of 3 miles his speed increased to 66 miles an hour and then to 74½. He stopped at Rochester for water, and slowed up after passing Crittenden. His average speed from Syracuse to Rochester was 67½ miles per hour, from Rochester to Buffalo 63.72 miles per hour, and from Syracuse to Buffalo 65.6 miles an hour. The run of 148.7 miles was made in 136 minutes.

The most remarkable long-distance run on record was when the Jarrett-Palmer combination went from New York to San Francisco in half time, or three and a half days. Their train left the Pennsylvania station in Jersey City at 12.53 on the morning of June 1, 1876. They were not to make a stop until they reached Pittsburgh. An engine and baggage car, on the approach of the special to Harrisburg got up a speed of about 50 miles and passed mails to the special by running along an adjoining track for several miles, while the mail bags were thrown from train to train. The run to Pittsburgh, 438½ miles, took 10 hours and 5 minutes, an average of 43½ miles an hour, notwithstanding the Alleghenies. From Pittsburgh to Chicago, 458.3 miles, took 11 hours and 6 minutes, an average of 42.1 miles, including 25 stops and four changes of engines. From Chicago to Council Bluffs, 491 miles, took 11½ hours, an average of 42.6 miles, although there was a record for part of this journey of 62.2 miles. Over the Union Pacific the run of 1032.8 miles from Omaha to Ogden was made in 24 hours and 14 minutes, at an average of 41 miles, and a maximum of 72 miles an hour. The brakes became worn at Ogden and hand brakes had to be used, retarding the onward journey somewhat, as the men feared they might lose control of the train. San Francisco was safely reached at 12.57 on June 4, quite in time for the dinner that had been ordered for the company for that day. The last stage of the journey was run at an average of 37 miles. During the entire run 20 engines were used, there were 72 stops, and the running time for 3313½ miles was 84 hours 17 minutes, an average of 40 miles an hour.

On the Pennsylvania Road 45 miles an hour is not uncommon, and there are level stretches where a speed of a mile a minute is attained. Samuel Carpenter, the general agent of the road for this city, said yesterday that if there was any need of making time to compare with the new English schedule it could be done. On the New York Central Road the run of 80 miles from Rochester to Syracuse has been made in 80 minutes when it was necessary

to make up lost time. Assistant Superintendent Voorhees of the New York Central said that he stood ready any day to send a party from New York to Buffalo, 440 miles over that road, in the same time

and keeping the platform in place. The levers are arranged in tandem style, so that the machine will take up as little room as possible and allow a clear deck for transverse tests. As the size of this com-

The Coke Trade.

The recent improvement in the coke trade still continues, and the present outlook for that industry is better than for some months past. The demand continues to grow in sympathy with the recouping iron market. The pig iron situation has not been more encouraging for months past, and the improvement is specially noted in the West where coke is used almost exclusively as fuel. With the improved demand for coke and the consequently increased shipments, a scarcity of cars is already being experienced by the operators. The shortage has been growing more and more marked for some time past, and, unless a decided change soon takes place, it is feared that a veritable car famine will occur. The estimated output for the week ending on September 8th was 100,365 tons, against 103,974 tons for the previous week. The falling off is due to the idleness of a large works, in the region where a strike is in progress. From the same cause the active ovens have also decreased from 10,103 to 9837, leaving 3241 still idle. The shipments for the week aggregated 5850 cars distributed as follows: To Pittsburgh and suburban points, 1220 cars; to Western points, 3130 cars; to points East of the Connellsville region, 1500 cars. The shipments for the previous week were as follows: Pittsburgh, 1250 cars; West, 3550 cars; East, 1750 cars; total, 6550 cars. The large falling off in shipments East and West is due chiefly to the scarcity of cars coupled with some petty strikes.

The French Government will not recognize Greenwich, and have resolved to fix one uniform time for the whole of the country. This will be "Paris time," which for the future will be adopted in railway stations and public places all over France, and it is to be called *l'Heure Nationale*. On the frontiers, however,

HIGH SPEED LATHE, BUILT BY CHARLES H. BESLY & CO., CHICAGO, ILL.

made by the English racer for 400 miles, if the party would pay \$2 a mile to get there in 7 hours and 25 minutes.

New Speed Lathe.

We show on this page a new speed lathe which is being put on the market by Messrs. Charles H. Besly & Co., 175-177 Lake street, Chicago, Ill. This lathe is designed to meet the wants of brass-workers and light metal workers. It has a 5-foot bed, swings 15 inches, weighs 600 pounds and has a hollow spindle with a $\frac{1}{8}$ -inch hole. The live spindle is of steel running in babbitt-metal boxes. The front bearing is $1\frac{1}{2}$ x 3 inches. The cone has four grades of speed for a 2-inch belt. The tail-stock has a set-over and a quick-return spindle. The countershaft has tight and loose pulleys, 7 x 2 $\frac{1}{4}$ inches, and should make 250 revolutions per minute. The lathe is well made in every respect and the wear is evenly distributed over the frictional and strained parts.

New Testing Machine.

Messrs. Riehle Brothers, Philadelphia, Pa., are turning out a new and improved screw-power testing machine for tensile, transverse and compression tests, combining the elements of accuracy, speed and facility in handling. The engraving which we annex explains the construction.

The machine is constructed of the best materials and the levers adjusted to the standard weights of the United States Government. There are three different speeds for testing a specimen and also for driving in the opposite direction. This allows of all the possible requirements of a wide range of material. There are no loose weights, and a single traveling poise, operated by a light hand-wheel, registers the strain accurately by means of a vernier. The power is applied by a crank with loose sleeve handle. Tools are furnished with the machine for making the various tests, and there are stops and holders for the grips, &c., as well as bolts and cushions for checking the recoil

of the machine is not very great, it is advisable to mount it on a solid wooden platform, from 16 to 18 inches high, so as to bring the crank and beam to a convenient working height, and made to suit the size of the machine base. The crank can be slipped on any of the three key-end shafts, and thus secure three changes of speed in testing. On stopping the crank

NEW TESTING MACHINE, BUILT BY MESSRS. RIEHLE BROS., PHILADELPHIA, PA.

the machine will maintain the pressure on the specimen as long as desired. The machine is being built in the following sizes: 10,000 pounds, 20,000 pounds, 30,000 pounds, 60,000 pounds, 100,000 pounds and 200,000 pounds capacity, and can be built of increased capacity on order.

both the national hour and the foreign hour will be shown by the official clocks. At the present moment three different systems of marking the time are in vogue in France. The new system will come into operation at the opening of the Universal Exhibition.

The Iron Age

New York, Thursday, September 20, 1888.

Protection and Progress—III.

The unprecedented economic disturbances of the last 20 years which, as Mr. Wells has so well shown, have furnished by all odds the greatest industrial force of the civilized world during that period, have been, as he also proves, the result of scientific inventions and applications of natural forces and resources. In other words, they are incidents of a progress which has become, in these latter days, so much more rapid and wide than ever before as to constitute a new element in economical science. The difference in degree practically amounts to a difference in kind. One consequence of this fact is the invalidation of many of the economic formulas worked out from data in which the element of progress was but slightly considered, if considered at all. The chance, for instance, that capital invested in buildings, ships, plant and all the machinery of trade, would be destroyed prematurely by world-wide changes due to new discoveries or improvements has not usually been taken into consideration in estimating the inducements and rewards of such investments.

Mr. Wells tells us that after the wholesale destruction of values in sailing vessels, occasioned by the opening of the Suez Canal, three successive fleets of steamers were built within a few years to navigate that canal, each new type rendering comparatively worthless all its predecessors, though these were still nearly new. The replacement of the paddle by the screw in ocean navigation was a similar process, but far less rapid, and hence incidentally less disastrous. The feature of the progress of to-day which we desire to emphasize is its instantaneous and catastrophic character. The actions and reactions of the "laws of trade" have been studied and formulated without much regard to this factor of time. A favorite figure with economists has been that of a fluid "seeking its level," and their favorite maxim has been, "Let it alone, to find its level." The picture in their minds has been that of a pond, augmented by some gentle wave at one side, adjusting itself under the influence of gravity. They have not realized that tempests and tidal waves and headlong torrents are also cases of a fluid "seeking its level." Or, to change the figure slightly, they have calculated the effect of this or that way of steering in a slow current and safe channel, and concluded that the best course is to drift. But they have not realized that the regimen of the stream has changed, and that violent freshets are continually changing even the channel.

Now, it is the function of tariff protection, not hitherto sufficiently recognized, to modify and retard the incidental disasters of industrial progress. As we have

already shown, protection mightily stimulates the international exchange of ideas, which is the chief element in this progress. We have now to add that while this helps to make a new improvement known at once throughout the civilized world, it tends, at the same time, to break the disastrous force of the consequent changes or revolutions of industry. American manufacturers, for example, get the knowledge of great improvements in manufacture, not in the form of a sudden ruinous competition, the means of which are perhaps secret to them, but in the form of descriptions, which may guide them in improving their own methods. This gives time for the inevitable change which home competition is certain to bring about. An extreme instance of protection—going much further than it would be (for reasons not now under consideration) advisable to go in general—is furnished by our navigation laws, which are absolutely prohibitory. But, for the point we are now presenting, this extreme case affords a striking illustration. For we owe it to our navigation laws that American ship-owners did not share in the ruin which the completion of the Suez Canal brought upon English ship-owners. The direct import of that tidal wave did not reach our shores at all. The innumerable vessels thrown out of use by that event were not permitted to work sudden disaster to our coasting trade.

To sum up our line of thought, progress is not only inevitable, but beneficial. Ultimately (and, indeed, sooner than pessimists believe), it benefits all classes—the manual laborers most of all. But it is attended with great disturbance and friction, and hence with much incidental distress and loss. It is the part of statesmanship to reduce these as much as possible and not wholly to sacrifice the present to the future. Violent changes in industry are to be deprecated, even when they are in the nature of ultimate benefits. The change may be a good thing; the suddenness and violence of it are not good. Stability is a blessing, too. And a wise protective tariff may so operate as to regulate, while it actually stimulates, the forces of progress.

The coming winter promises to be a busy season with shipbuilders on the lakes. The summer has been fairly profitable for the vessel owners, whose lines have been well employed at good rates, and the increasing iron ore shipments now cause them to feel very hopeful of the prospects for next year. Under such conditions they will not hesitate to replace old vessels with better ones, and to add new vessels to existing lines. Some contracts have already been placed with shipbuilders and more are under negotiation. The use of iron and steel in lake shipbuilding increases every year, and some of the wooden shipyards in Michigan will soon add plants for the construction of iron and steel vessels, recognizing the tendency of the times. The steel vessels now in use on the lakes have won for themselves a high reputation for speed and endurance. A short time since one of them was driven by a storm on the Government breakwater outside of the harbor of Chicago, and the receding waves left it with almost half its length projecting in the air. The officers expected it to go to pieces under such a

severe strain, but tugs were secured from Chicago as quickly as possible which pulled it back into the water. It was then dry-docked and found to be injured but slightly. The quality of the work turned out by American shipbuilders both on the lakes and on the seaboard is most excellent, and notwithstanding the gibes of callow statesmen, we are making progress in this branch of industry every year which will count heavily in our favor whenever the conditions are propitious for our entrance into the race for supremacy on the ocean.

The Friction of Leather Collars in Hydraulic Presses.

Since the time of the experiments conducted by Mr. John Hick, more than 20 years ago, nothing that we know of has been done in the line of investigating the friction of cup-leathers and other packing in hydraulic presses, except what has quite recently been accomplished by Mr. J. E. Tuit, Assoc. Mem. Inst. C. E., and recorded a short time since in *Engineering*. Trustworthy information as to the ratio between the gross pressure exerted by the liquid contained in a hydraulic press and the useful pressure transmitted by its piston was, in fact, entirely lacking previous to Mr. Hick's experiments, the only published figures probably being those given by Professor Rankine in his admirable treatise on "The Steam Engine." These, however, place the friction between a plunger and its collar at about one-tenth of the total effort of the water on the plunger, or somewhere between one-ninth and one-eleventh, values which not only seemed much too high, but which evidently could not be applied to plungers of varying diameters without the chance of introducing serious errors, the diameters obviously having a direct bearing on the results. It was probable, moreover, that the friction of a properly designed and constructed cup-leather packing was much less than in the case of any form of packing of which the tightness and coefficient of friction depended upon the behavior of that uncontrollable variable, a man with a monkey-wrench. Mr. Hick's investigations appeared to give ample proof of all this, and his results are even now, though not of undisputed accuracy, as it would seem, entitled to careful consideration, having been arrived at by a series of tests in which neither trouble nor expense was spared to insure reliability. We cannot undertake to supply here in detail the trial figures which he obtained, but annex a table which gives, in a compact and convenient form, the frictional resistance in percentage of the total hydraulic pressure for rams ranging from 2 inches to 20 inches in diameter. It was within these limits to size that the experiments were made.

Dia. of ram inches.	Friction per cent.	Dia. of ram inches.	Friction per cent.
2	2.00	13	0.33
3	1.33	13	0.30
4	1.00	14	0.28
5	0.80	15	0.26
6	0.66	16	0.25
7	0.57	17	0.23
8	0.50	18	0.22
9	0.44	19	0.21
10	0.40	20	0.20
11	0.38		

The great reduction in these friction values as compared with Professor Rankine's estimates is at once apparent, and is

quite striking. It will be noticed also in the table that the coefficient of friction diminishes rapidly as the diameter of the ram increases, a circumstance which Professor Rankine seems to have ignored entirely in his investigations, but which exerts a most important influence in arriving at the efficiency of a press.

It is interesting now to compare with these figures the results obtained by Mr. Tuit as noted above. Mr. Tuit experimented with six different forms of presses, the plungers ranging from 4 to 14 3/8 in. in diameter. Two of the presses were furnished with cup-leathers both at the top of the cylinder and lower end of the plunger; two others had cup-leathers at the lower end of the plunger only; the fifth had a cup-leather in the plunger, and a stuffing-box with packing fitted to the cylinder, while in the sixth there was no cup-leather, a stuffing-box with packing alone being employed. The presses were marked respectively D, E, A, B, C and F. In some of the trials a strip of iron was introduced on one side between the upper surface of the ram and the plate against which it was pressing, thus representing a load not coinciding with the axis of the ram. From the table of results obtained, we extract the following figures:

unless we attribute the variation in the results in a great measure to personal equation. With even an extremely liberal allowance for this, however, the results should show better agreement. It is not the varying length of the leather touching the ram which can be held accountable, since this has been found to exert no appreciable influence, and as to the registering apparatus for the pressures, we are assured in both cases that it was carefully adjusted and tested, thus leaving no room for doubt on this score. As matters now stand, therefore, additional experiments are highly desirable—in fact, necessary, to set at rest the doubts and speculations as to what the friction of leathers and packing in hydraulic presses actually amounts to. The approximate figures which are all that is now available, are entirely too vague to serve any useful purpose, and should not be allowed to remain as the only data upon which engineers must base their calculations.

Railway Associations.

Some rather sensational articles and telegrams have lately appeared in the daily papers prophesying the early breaking up of the different traffic associations among our railroads. It is probable that the danger

among all their members, amount in each case to but little more than the salary of a capable officer, while the statistics alone, as well as the opportunities offered for exchange and discussion of views, are benefits worth indirectly all they cost. It is to be hoped that these associations will not be abandoned by the railroad managers, if for no other reason than because of the uniformity of action and comparative steadiness of rates, which they help to secure to the shipping public. It is a truth in political economy that even high taxation is not as bad as unequal taxation, and the same applies to transportation. When we consider how important a part of the value of our products and manufactures is the charge of the carriers, and how great the confusion in our industrial system would be if these charges showed wide fluctuations from day to day or week to week, we see how valuable is uniformity of tariffs. But such steadiness in the nature of things can only be secured by some sort of an agreement between roads which compete for the traffic between the same points. A cast-iron pool controlling absolutely the rates in a given territory is an extreme which the Interstate law condemns; but surely a haphazard style of tariff and rate making, where one road proceeds upon a theory entirely different from its rival, is the other and equally bad extreme. In our day, among the members of a given trade or manufacture, the necessity of some concert of action is recognized as never before in the history of commerce, and, leaving the so-called "trusts" out of view, there is still a large field for legitimate organization, for the collection of trade statistics, for the reformation of trade abuses and other worthy objects, which no healthy public sentiment will condemn. What, then, we demand for ourselves we should freely concede to our railroad friends, whose position as regards the need of such organization is even more difficult than our own.

We are still in the experimental stage as regards the pooling question. The strong roads favor its prohibition. They believe in the survival of the fittest because they believe that they are the fittest, but this does not cover the whole question. Chairman Blanchard's article upon the subject in the August *Forum* marks a distinct advance in the discussion of the problem. Mr. Blanchard advocates a restoration of the pooling privilege to the railroads, but under the minute and detailed oversight of the Interstate Commission. Possibly the author in writing the article had the precarious condition of the present associations in mind, and knowing the necessity of some organization, was preparing the public mind for a pooling plan under changed conditions. He asks: "If 50 cents is a reasonable rate, what objection can there be to its division among several competing lines?" None, of course, but that "if" involves the whole question. How shall we determine whether 50 cents is a reasonable rate? Only in one of two ways: Either by competition, as in mercantile affairs, or by some strong combination subject to the absolute right of some controlling body to alter rates at pleasure. The former is the principle of the Act prohibiting pooling, the latter is the plan proposed by the chairman of the Central Traffic Association. The latter plan involves also in time the close control of transportation by

It was formerly fitted with cup-leathers, but these seldom lasting more than one week, were replaced by packing, which has not been renewed for twelve months. The bear has been in constant use night and day.

* By "good bearing" it is meant that the weight raised was equally distributed over the upper surface of the ram.

The remarkable difference between these results and those of Mr. Hick needs not be specially pointed out. The discrepancy is so great that it attracts attention at once, the coefficients in several cases closely approaching Professor Rankine's, while in others they even go beyond. Mr. Tuit presents the figures simply as he obtained them, without comment or attempt to explain why they should point to such extraordinarily high percentages of friction; and, indeed, it is difficult to offer a satisfactory explanation

of any complete overthrow of these associations has been exaggerated, but there is enough truth in the report to cause anxiety in railroad circles. It is an open secret that great dissatisfaction exists with the large expense incurred for their support—an expense which certain members declare to be out of any proportion to the small amount of good the present form of combination is capable of doing. This, however, is not the opinion of other and more conservative railroad managers. The expenses of those organizations, as divided

some governmental machinery, and would also open such a body to the cry of "confiscation of private property" should they declare a reduction of rates in opposition to railroad managers—in fine, a step toward the bureaucratic system of Europe. Meanwhile, the plan of voluntary association is proving as incapable of producing all the desired results among railroads as it has among tradesmen. If we concede that some form of organization among carriers is essential to the best interests not only of railroads, but of the mercantile public, it remains still in doubt what the best form of that organization shall prove to be.

Our Trade with Hayti.

Like most other coffee-producing countries, our domestic export trade with Hayti has received a great impulse from the appreciation of the article, and as that country usually takes half of what it imports from the United States, it is to be hoped that the revolutionary change of government which occurred last month may not be followed by a disastrous renewal of civil strife. Revolutions have been more frequent in Hayti than in any Spanish-American country, hence the administration of President Salomon, lasting nine years as it did, and being in every respect successful, was an exception to the rule. A vigorous attempt to upset him was, it is true, made after he had been in power four years; civil warfare shook the Black Republic to its very foundations during many months in succession, but President Salomon put it down with an iron hand. The next attempt at revolution was early in June last; it was nipped in the bud by exiling the alleged ringleaders, Generals Manigat and Légitime.

Generally a Haytian revolution begins with a big incendiary fire at the capital, Port-au-Prince. Two such fires were kindled on July 4 and July 7, and an enormous amount of property became the prey of the flames, not a small portion belonging to foreigners. Two incendiaries caught in the act were shot, and for the moment all was quiet again, when early in August General Télémaque marched upon the capital at the head of an armed force, but was defeated at Plaisance by the Government troops under General Jumot on August 10. In spite of this check the revolution prevailed, and at Port-au-Prince General Boisrond-Canal tried twice, but in vain, to form a provisional Government. General Légitime was then called back from his exile in Jamaica, while President Salomon received an intimation to leave the country, which he did, boarding the British man-of-war *Canada*. He has gone to Paris, where he will stay permanently. Aged 75, as he is, and tired of politics, his career may be considered closed. During his nine years of rule President Salomon has achieved a great deal for the good of his country. He raised the credit of Hayti abroad, regulated and recognized the foreign loans, paid indemnities to all foreigners who had suffered from the rebellion in 1883, floated at Paris a new loan for 7,500,000 francs and settled with our Government the \$120,000 Van Bokkelen claim. President Salomon caused to be established more than 300 schools, built a palace for the Government and for both Houses of Congress, established a bank, opened sev-

eral roads and was just negotiating a contract for a railroad between Port-au-Prince and Cape Hayti, when he was compelled to leave. After the revolutionary troubles of 1883 President Salomon added to the navy two effective men-of-war, one a steel ram, under the command of Commodore Mason Cooper, formerly an officer in the United States navy. Hayti has now altogether five armed vessels, with a total armament of 30 guns, while the army has a strength of 6828 rank and file.

The outlays in 1886 were \$6,412,956, squared by an income equal in amount. The budget for 1887 fixed the outlay at \$4,066,236. Public indebtedness consists of a foreign debt of \$5,820,000, and a home debt of \$9,180,000. The circulating medium is the Haytian silver dollar, coined since 1881, of an intrinsic value of 80 cents American gold. Much has been done during President Salomon's rule, to improve the quality of Haytian coffee and prepare the same more intelligently for export; large establishments have been created for sorting and properly drying it, and during the nine years of his administration the export has from 40,000,000 pounds increased to 75,000,000 pounds.

There are two parties in Hayti—the negro and the mulatto party—the former being numerically the stronger, the latter representing the younger, more restless element. While Salomon understood how to rule them both, the personal ambition of the generals who now aspire to seize power may prepare troublesome times. In 1886 the import into Hayti amounted to \$4,965,256, while the export reached \$7,555,996. Our share in the import was 52 per cent., in the export 14; France's proportion was 21 and 66 respectively; England's, 15 and 5; Germany's, 9 and 8; Belgium's, 3 and 3, and that of other countries, 3 and 4. The goods exported in the same year were: Coffee, 58,075,733 pounds; cocoa, 3,939,445 pounds; wool, 2,037,653 pounds; hides, 436,579; orange peel, 461,768; sugar, 289,354; cotton seed, 34,536; tortoise shell, 906; wax, 3619; honey, 18,001 gallons; cigars, 17,000,000; logwood, 282,620,852 yards, and besides cotton, fustic, mahogany and old copper. The number of vessels entered was 684 with an aggregate tonnage of 668,003 at the four leading ports: Cape Hayti, Port-au-Prince, Gonaives and Aux Cayes, 427 thereof being steamers.

American trade during the last two calendar years was as follows:

	Import.	Domestic export.
1887.....	\$1,884,803	\$3,782,772
1886.....	2,309,989	2,702,114
Increase of export.....		1,080,658
		or 39 per cent.

A cablegram received at Washington on September 6 from Captain Chester, commanding the United States steamer *Galena*, arrived at Kingston, Jamaica, which was ordered to Port-au-Prince for the protection of American interests said to be imperilled by the recent revolution, stated that the troubles in Hayti were at an end for the present. It is to be hoped they may continue so.

A case of railroad discrimination recently ventilated in Kansas affords in itself strong justification for the creation of commissioners with power to correct abuses. It appears that the Missouri Pacific Railway Company handle a large tonnage of coal

from the mines of Osage County, Kan., and also from the mines in the vicinity of Rich Hill, Missouri. This coal they distribute among consumers scattered throughout a vast territory in Kansas. The coal operators of Osage County complained to the Kansas Railroad Commissioners that on July 20th the company raised the coal tariff from 10 to 30 per cent. higher than the old rates to all points which these operators could reach. It was charged that this was a willful discrimination against the Osage County operators in the interest of the Rich Hill mines, which are for the most part owned or controlled by the railroad company, and whose product is marketed in the same territory. Comparative tables were presented, by which it was shown that on a carriage of 109 miles the Osage County coal paid a freight rate of \$2 per ton, while the Rich Hill coal paid but \$1.10, which was a clear discrimination in favor of the latter of 90 cents per ton. Under such a tariff it was asserted that the Osage County operators would be obliged to discontinue business. After a thorough investigation, the railroad commissioners decided on the 13th inst. that the company had violated the laws of the State of Kansas, and that they should be directed to reduce the rates on Osage County coal to conform with those on the Rich Hill coal. Practices of this kind deprive the railroad companies of the sympathy which they desire to cultivate among the general public. They complain that they are unfairly treated by the railroad commissioners of several Western States, and that unremunerative rates are arbitrarily fixed by such commissioners, causing heavy reductions in earnings, making the payment of dividends to stockholders impossible, and seriously depreciating the value of railroad property. It is unfortunate for those who have their money invested in railroad stocks and bonds that the managers of their property should act in a manner calculated to excite the hostility of the general public toward railroad corporations. Until such managers learn to treat all interests fairly and honorably this friction will continue, and, in the meantime, owners of railroad stocks and bonds must suffer the unfortunate consequences of the folly of those who represent them.

The outcome of the proposals recently invited by the Secretary of the Navy for tubulous, sectional or coil boilers for one of the armored coast defense vessels will, no doubt, be closely watched, being of special interest because of the almost universally unfavorable experience with boilers of this class for shipboard duty. The Belleville boilers in the French Navy are, we believe, at the present time the only notable examples of such boilers afloat with which anything like satisfactory work has been done, and even so far as these are concerned it is still a fact that not a single ship of the commercial marine has been fitted up with them. In this country water-tube boilers have been tried for marine purposes in a number of instances, always with unsatisfactory results, though it may be said, with some reason, that their poor performance and early abandonment were more largely due to incorrect design and construction than to error in principle and general lack of efficiency. As a matter of fact, some of the early

boilers of this class placed aboard ship were condemned even before they were fired, and their failure on trial was to be expected. There were several reasons why they should fail. The tubes were connected rigidly and were placed nearly horizontally, no provisions being made either for expansion and contraction or for circulation. In the absence of equalizing pipes, moreover, connecting the steam ends of the several sections, the feed being supplied from a common water-pipe, some parts were liable to become empty while others were full of water. It is not strange, therefore, that the boilers did not last. They were repaired a number of times, and some changes were made, but they were finally condemned and replaced by others. Some which had been put in place were again taken out without ever having been fired. One of the ships in the United States Government service having a water-tube boiler built by Messrs. Babcock & Wilcox some years ago performed very satisfactorily—an exception, however, to what appears to have been a general rule. Added to the difficulties which resulted from the imperfect design of the boilers, were those of excessive weight and the great amount of space occupied by them, in themselves almost sufficient to cause their removal even had they been successful in other respects. Since the time of which we speak important advances, it is true, have been made in the building of water-tube boilers, but their special fitness for marine duty has by no means been yet established. In point of complexity, large size and heavy weight for given powers, they are still objectionable as compared with accepted types, though, on the other hand, they have redeeming features, such as safety, the possibility of longer life, efficiency and others which are not to be ignored. From whatever point considered, however, the tests which the Navy Department proposes to make with the boilers submitted for trial promise to yield data alike interesting and valuable. At the same time we doubt very much whether the results will be such as to warrant the adoption of any one of the designs for the purpose in question.

Steel Ties in Burmah.—According to *Indian Engineering*, steel ties, after having undergone a careful test for the past four years, on different parts of the line, are now displacing the teak railroad ties hitherto used on the open line of the State Railway. Teak so far has been found the best timber yet used for this purpose, and has been found to last as long as 10 years; but the use of steel ties economizes the expense of spikes, and is reported to last from 40 to 50 years. The low price now ruling has been a great inducement not only of substituting steel ties, but also a large quantity of steel rails is now being used in this Province.

Carter H. Fitz Hugh, formerly with Goulds & Austin, Chicago, has severed his connection with that firm to accept a position with Joseph T. Ryerson & Son, iron and steel merchants, of the same city. Mr. Fitz Hugh is well and favorably known in the Chicago iron and steel trade.

Mr. F. R. Phillips, 407 Walnut street, reports a large and continually increasing demand for Post's "Zero." Headquarters for "Zero metal" for Eastern Pennsylvania, New Jersey and Delaware is at 407 Walnut street, Philadelphia.

Copper Prices and Electrical Progress.

One of the principal claims in behalf of present high prices of copper put forward by those who have engineered the rise of the past year is that the consumption of the metal has become very much heavier by the introduction of electricity for a large variety of purposes. That the demand for copper wire for telegraph and telephone lines, for dynamos, motors, lightning and the transmission of power has very greatly increased cannot be doubted. Even the most careless observer of progress during the past few years must have been struck with that fact. But when the point is reached of securing some numerical expression of this new source of consumption—when the effort is made to ascertain, even roughly, how many pounds of the metal go annually into these new channels, then everything fails us. Figures could be reached only by an elaborate investigation freely and generally aided by those who draw copper wire. The quantity used in this country may be 20,000,000 pounds, and may possibly be considerably more, though it is not likely to be less. We have been unable to secure data from electrical companies which might throw some light on the rate at which this new business is developing so far as the quantity of metal used is concerned.

Some idea of the development in this country in a single year may be obtained from the figures submitted in President Duncan's address before the National Electric Light Association. In February last there were 4000 isolated electric lighting plants and central stations in the United States, which operated 175,000 arc lights and 1,750,080 incandescence lights. Since then there have been added 1361 new isolated plants and stations, operating 35,201 arc lights and 392,944 incandescence lights. A complete record is kept of these and shows that now there are 3351 plants and stations, operating every night 192,500 arc and 1,925,000 incandescence lights. There are also 459,495 horsepower of steam engines devoted to electric lighting. The capital invested in the electric lighting companies during the past half year has been increased to the extent of \$42,210,100. In February there were in this country 34 electric railways, with 138 miles of track, operating 223 motor cars, and utilizing 4180 horse-power for stationary engines. Forty-nine new roads are now being built, having a total of 189 miles of track, and to use 244 motor cars. There are also several motor factories, some of them employing as many as 1200 men.

Progressing with such leaps and bounds, it is not surprising that those who have undertaken to control the most important raw material entering in the construction of apparatus and lines should be sanguine concerning the aid which the new uses of electricity are liable to give them. Indirectly the call for copper from a new source with its promise of rapid increase is a subject of great interest to consumers of rolled and cast brass and copper in all its forms. In view of their requirements alone, the enormous production has already been stimulated by prices undoubtedly above any possible legitimate values. The question naturally arises, will the demand for electrical purposes increase so rapidly and so largely that it will enable the speculators to exact tribute not alone from every one who builds, operates, or uses a telephone, the electric light or plant for electric transmission of power or conveyance of goods or passengers, but also from every consumer of copper or brass? Has the high price of the metal already had the tendency to obstruct or to check the progress of electricity?

On the latter point we are in a position to place before the readers of *The Iron Age* the following letters from a number of companies who have had a prominent part in the development of the past few years.

A leading company in introducing electric railroads and motors write:

In our business the consumption of copper has quite largely increased in the last two years. We make a much larger number of motors, requiring a proportionately greater amount of copper wire, and we also use a large amount in overhead wires in street railway work—this part of the consumption being quite new. The average cost of the copper in any machine varies quite widely with the size of the wire used, and the effect of the recent rise in price of copper ingots varies in the same way, being small if the wire used is small, and being comparatively large if the wire used is large. The smaller wire requiring a considerable amount of labor to give it its market value, the price of the ingot has a relatively less effect. Roughly, we use 50 pounds of copper for every \$100 worth of work on our motors.

A concern manufacturing dynamos and interested in electric lighting and the distribution of power states:

The growth of electricity has considerably augmented the demand for copper, as it very largely enters into the cost and erection of a plant; and while we do not believe that the increased price has prevented the introduction of electricity, for the reason that the people are becoming educated to its use, and popular sentiment demands it, still the increased cost affects the manufacturers very materially, the competition in electric lighting apparatus being so active that prices cannot be made to compare with the increased cost of material, of which copper is a large element.

A producer of motors puts himself on record as follows:

We have no statistics of sufficient value for publication referring to the effect of the rise in copper upon the demand for our goods. We can briefly state, however, that we pay for copper for each machine nearly one-half the total cost of the machine. The business is yet so young that the motors have not established for themselves an accepted value, but their market price is largely governed by prices charged by some new company who are endeavoring to get the field. It will be some years yet, probably, before the market will be so settled that change in the price of the raw material will directly affect the selling price, and consequently the demand for the finished machine. The rise in copper has certainly added considerably to the cost of our plant and equipment.

A firm of large contractors holds the following opinion:

Inasmuch as a very large proportion of expense in electrical construction is for copper, the rise in price, which is the result of the operations of the syndicate, has, in our opinion, materially affected the introduction of electricity in plants of large size. We cannot answer your question as to what extent the cost of metal enters into the total cost of equipment, inasmuch as it depends so largely upon the character of the work. In some cases much the greater part of the cost is for labor, and in other cases a very large part of the cost is for copper.

From the Eastern States a concern making lamps and wires expresses the following opinion:

We have no doubt that the growth in the consumption of copper for electrical purposes has seriously influenced the demand and aided in making possible the success of the copper syndicate. Unquestionably the rise in copper has materially added to the cost of electric light plants. For instance, making estimates to-day for a local plant in a town of 15,000 inhabitants, our estimate for the wire for conductors is \$17,500. This estimate is 25 per cent. higher than it would be if copper were at the old price of 14½ cents. We do not believe the increase in the price has seriously affected adversely the introduction of electricity for light and power purposes. Our own business has increased threefold in the past year, and we doubt whether the increase would have been any larger had copper remained at the old price.

A very well-known company who are builders of electric lighting plants and of motors reply to our questions:

Two years ago we were not purchasing any copper, but during that time we have placed 3000 arc lamps and some incandescents. This,

of course, is a very small part of the business that has been done. The rise in copper has added materially to the cost of plant and equipment. The cost of copper is about 25 per cent. in our system as compared to the cost of other material and labor. In systems where they use many pounds of copper wire more to produce the same result the proportion would be greater. But if you consider the copper in line wire that it requires to install a plant the cost would be much more than the cost of labor and other material. We do not know that the increased price of copper has affected the introduction of electricity for a variety of purposes, but it has affected the pocket of the manufacturer.

An important Western company reports to us as follows:

With the constantly extending use of the electric light and electric transmission of power, it is obvious that the percentage of copper used in electricity has been and is increasing rapidly. We buy tons of copper now where we bought hundreds of pounds a few years ago, but it is noticeable that during all the time of this rapidly increasing consumption of copper the price of copper did not advance, but, on the contrary, fell to the lowest point it has seen. Since the recent large advance in price, it is our impression that the use of copper in electrical enterprises has diminished instead of increasing. The advance in the price of copper adds very materially to the cost of electric light and electric power plants. The cost of copper in a plant is perhaps one-third to one-half the entire cost of the plant, and the largely increased cost of an electric light or electric power equipment due to the advance in the price of copper has considerable influence in checking the introduction of plants.

The president of one of the great electric light companies writes:

The growth in the consumption of copper for electrical purposes has, in our judgment, seriously influenced the demand. We have been in business about 15 years and we use now about \$150,000 worth of copper in various forms each year, whereas 10 years ago our use of it was not even one-fifth as large. The rise in the price of copper has materially added to the cost of the electrical-apparatus manufacturing business. The cost of copper in our largest size machines, which are the ones we sell the most of, is a large part of the cost of the entire machine. We do not know that the increased price of copper has adversely affected the introduction of electricity, because, so far as we are aware, there has been no increase in the price of electrical apparatus to correspond with the increased cost of copper. We have always understood from the manufacturers of copper and brass materials that the electric light business was a very important element in their business, and that the amount of copper used in the aggregate in the entire electric light industry was very great indeed and constantly increasing. We believe there can be no question regarding this. Another point to be considered in this matter is the fact that the finest quality of copper is required for a very large part of this work and this grade of copper is apparently produced only by the Calumet and Hecla Mining Company, Calumet, Mich., and the other mines in that part of the country. We still believe, however, that the present price of copper is wholly artificial; that the facts regarding the increased demand, which we have admitted, do not justify any such increase in the price; that copper can be produced by existing mines in this country at a very large profit if it can be sold at 12 cents per pound, and we believe that if the matter should rest purely, as it should do, on the basis of supply and demand, the price would never go above 12 cents per pound.

An Eastern company handling electrical supplies says:

In our judgment the growth in consumption of copper for electrical purposes has to a great extent influenced the demand for that metal. Copper is one of the important factors in the construction of an electric light plant. The dullness of the past few months in the electrical field has been wholly due to the high price of copper. Now that the price has become fixed and there is no prospect for cheaper copper for some time to come business is going forward as usual, but not to that extent that it would with copper at lower prices.

The president of a prominent electrical company of New York writes:

I have not the time nor the information to properly answer your letter. Of course the advance in the price of copper affects to a certain extent the electrical business, not especially because of the quantity used in the construction of electrical apparatus, but principally as connected with the installation of the plant—that is, the wiring.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., September 18, 1888.

The Senate Sub-Committee on Finance are still at work giving hearings to industries, and are not disposed to cut them short. Senator Hiscock, when the subject of terminating this branch of their labors was broached a few days ago, said that he was opposed to any action in that direction; that he proposed to give every industry in the State he represented a chance to be heard wherever they had expressed such a desire. Senator Allison takes the same view, and in that he is sustained not only by his colleagues of the full committee but in the Senate.

It has been ascertained that the most important feature of the metal schedule of the Senate tariff bill will be the unification of iron and steel on the basis of uniform duties on imports for both revenue and protection. It is stated by members of the committee that the change in the system of regulating duties on manufactures in iron and steel will have the effect on a number of manufactures of steel of practically raising the duties. This is a very radical move on the part of the committee, but they claim that steel within the past 10 or 15 years has been substituted for iron in so many branches of metallurgical industry that they should be classified together. They claim that the revision might go further by making steel the basis upon which to regulate the duties on iron. This feature of the bill, when submitted to the Senate, will undoubtedly lead to a spirited and protracted debate, and will give the press generally, and technical papers in particular, a fruitful and fresh theme for comment and discussion.

The Democratic wing of the Senate Committee are in a bad way for some one to write their minority report on the Senate Tariff bill. Senator Voorhees, the senior on the committee, has given the subject no attention whatever, and does not desire to figure prominently just now in the heat of a campaign against the Senate Protective bill, nor to put himself on record quite so notoriously in favor of the Mills bill as an exponent of Democratic doctrine. Senator Beck is ill at Fortress Monroe and will not be able to resume his place in the Senate earlier than December, nor is he in condition to prepare the minority report, which was expected of him. Senator Harris, the other member of the Sub-Committee, is such an ultra pronounced free trader that a minority report by him would be an indorsement and an emphasizing of the Republican charge that the Mills bill is a free trade measure. How this question will be disposed of is a puzzling problem to the Democrats of the committee and the Senate.

Senator Allison says that, taking the experience of the committee as a guide, he has not found six prominent woolen manufacturers in the United States, and not over three in Rhode Island, the seat of that branch of textile manufacture, who are in favor of free wool.

The stockholders of the Redstone Coal, Oil and Coke Company held a meeting recently at the Monongahela House, Pittsburgh, at which the future plans and prospects of the company were discussed. Jacob E. Ridgway, of Philadelphia, president of the company, presided. Dr. W. R. Brown, also of Philadelphia, is the only other member of the company outside of Pittsburgh men. It was decided to proceed at once to develop their property in Fayette county. Their lands lie in Redstone township, several miles east of Brownsville, and the works will be located near Redstone Village. There are extensive

soft coal fields in the vicinity, but owing to lack of transportation the land has never been developed. Some time ago the Pittsburgh, Virginia and Charleston road surveyed a single track branch road from West Brownsville. On the line of the road the works will be located. Fifty coke ovens will be built at once. The plant will be increased as soon as the business warrants it. A coal shaft 265 feet will be sunk. The coal is right under the site of the coke ovens. The capacity of the latter will be about 2000 tons. A number of tenement houses will be built for the accommodation of the men sinking the shaft, and after the latter is completed the houses for the occupancy of the cokers will be put up.

We take the following from the Marquette, Mich., *Mining Journal*, of the 8th inst.: Shipments of iron ore from the mines of the Lake Superior region for the week covered by our shipping report aggregated 198,235 gross tons, to which total this port contributed 52,957 tons, Escanaba, 70,499 tons; St. Ignace, 326 tons; Ashland, Wis., 53,315 tons, and Two Harbors, Minn., 11,038 tons. The total for the season is 2,806,173 tons, this being 214,783 tons less than the quantity that had been sent to market by water at the corresponding date last year. The shipments by ranges to date are as follows: Marquette range, 1,113,139 tons; Gogebic range, 810,055 tons; Menominee range, 661,662 tons; Vermillion range, 221,353 tons. The following table shows the shipments by port up to date this season in comparison with the shipments for the corresponding portions of the two preceding years:

Port.	1888.	1887.	1886.
Marquette.....	508,437	557,909	615,022
Escanaba.....	1,312,709	1,383,419	1,006,890
St. Ignace.....	70,526	63,467	45,527
Ashland, Wis.....	689,148	759,850	465,508
Two Harbors, Minn.....	221,353	256,911	211,954
Total.....	2,806,173	3,020,956	2,344,907

Railroad growth in the United States, as shown by the examination of statistics, corresponds very nearly to the actual demands of business. Comparing the census of 1880 with the latest report of railway operations it appears that the tons of freight transported 1 mile during the census year numbered 32,848 millions, and last year 60,061 millions, according to Mr. Poor. A little division brings to light the fact that the average was about 868,000 tons 1 mile for every mile of railroad in 1880, but it was 438,000 tons 1 mile for every mile of railway in 1887. The increase of 70,000 tons per mile of road operated is not quite 20 per cent., but, in spite of the increase in mileage, which has been extraordinary, the increase in tonnage transported has been nearly a fifth greater. It becomes evident that there is now more business for every mile of road in operation than there was eight years ago, although the mileage, meanwhile, has increased more than half. On the old roads traffic increases faster than population.

Three cruisers for the Spanish navy are to be built in Spain, by a native firm, who intend, with the assistance of a North of England shipbuilding company, to establish works in that country.

German steamers are getting a strong position in the coastwise trade of Japan, in this respect placing those of England at a disadvantage. While British tonnage doubled at some of the leading ports since the year 1880, that of Germany increased many fold. It is surmised that a grand opening exists for the introduction of American steamers of from 600 to 1500 tons carrying capacity and not under 9 knots per hour.

THE WEEK.

A large gang of men at work in the Hoosac Tunnel were overcome by coal gas from a passing locomotive, owing to a condition of the atmosphere peculiarly unfavorable to free ventilation, and 18 were rescued in an unconscious state. Two of them will probably die.

Five employees of a leading grocery firm in this city, shipping clerk, carmen and others, who entered into a conspiracy to rob the firm, were sentenced by the recorder to five years in the State prison.

The new machinery of the steamer City of New York is not easily persuaded to come up to the requirements for high speed. The delay experienced by her on the first trip out from Liverpool was scarcely less aggravating on her second trip just completed. Some of the valves of the main circulating pumps caused a delay off Queenstown, and later the same difficulty occurred again, causing both the port and starboard engines to slow down or stop altogether, and, finally, when the ship was off Newfoundland, the valves gave out, causing some anxiety, if not alarm. The climax was not reached, however, until the engines remained stationary for two hours, on account of trouble with one of the piston-rods. The entire voyage occupied eight days and 13 hours.

Wire gauze for baled cotton is recommended as a covering equal to jute bagging, having withstood the severest tests when exposed to fire, and the subject is being favorably considered at the New York Cotton Exchange.

Dismal accounts come from South Carolina and Georgia respecting the destruction of cotton, corn and rice by the recent floods.

An interesting conflict took place at Sydney, New South Wales, about August 1, between the local labor organizations and the Oceanic Steamship Company, assisted by the United States Consul Griffin. The former demanded that Captain Morse of the California steamship Mariposa should receive on board some 20 odd Australians to take the place of an equal number of Mongolians employed in the fire and engine-room of that steamer. In defiance of fierce opposition the consignees of the cargo succeeded, with the aid of the police, in discharging the vessel—an object that was important, in consideration of the fact that the merchandise on board consisted mainly of contributions for the Melbourne Centennial Exhibition. It had been widely affirmed that, although the Mariposa might land her cargo, she would be prevented from going to sea by lack of coal. Not only had the coal heavers refused to work upon the vessel, but all the coal-dealing firms in the city had been warned not to furnish her with fuel. Great surprise therefore was occasioned when 1500 tons of coal were floated alongside under protection of the Sydney police, the American Consul having in due season made ample provision for the precise emergency which arose.

The provisional government organized in Hayti, under ex-President General Boisrond Canal, is said to have the entire confidence both of native and foreign merchants. Business is brisk and the premium on gold has fallen to 20 per cent.

The East India cotton crop this season falls below the very short crop of last year.

The Julien electric car has made another successful run in this city and the company are eager to put it on the roads, but thus far the Aldermen withhold their sanction. The car rests upon double rails similar to those used on steam railways.

The wheels of each truck, however, are set very closely together, the distance from center to center being only 3 feet, as compared with 4½ feet to 6 feet on the ordinary railway trucks. The entire truck, moreover, is pivoted not at the center but at the end. These two modifications enable the car to make very short curves and secure ease and smoothness of motion. The same motor that propels the car furnishes the light that supersedes the oil lamps in the car. Each truck carries a motor capable of propelling four cars, so that the danger from break down is reduced to a minimum. A fresh battery stores sufficient power to drive a car with ordinary load for 30 to 35 miles.

The export trade in cotton at New York is being diverted to Norfolk by the prevailing high ocean rates from this port, in conjunction with the lack of "compress machinery" to reduce the size of the bales, but a large machine will soon be in operation in this market, supplying much needed facilities.

The shipyards on the Delaware are expecting a number of new contracts, and are providing themselves with heavy tools. Claus Spreckels wants steamships of the largest size for the Australian line. Two steel steamships are about to be put under contract for the Ocean Steamship Company, of Savannah, for the coastwise trade. A steamer to carry oil in bulk is wanted by the Standard Oil Company, and Boulton, Bliss & Dallett, whose steamship line to Venezuela has proved so successful, want two more vessels to replace two recently sold for service on the Pacific. Work enough is in prospect to keep all the yards busy for the next two years.

Japan, like China, is giving earnest attention to the manufacture of cotton. Already there are 21 mills in Japan, the number having been doubled within the last 18 months, and it seems not unlikely that the Japanese will soon be independent of all other countries as regards cotton yarns. In China cotton yarns form about 30 per cent. of the value of all cotton goods imported, and the demand is continually increasing. Much yarn is imported from Bombay.

The Grand Opera House block, in Syracuse, was burned, 13th inst., and the loss is computed at \$208,000. Among the occupants were John Hamon, Jr., stoves and hardware, loss \$6000, and George S. Friend, stoves and household hardware, whose loss is estimated at \$8000.

The contract for the erection of the main exposition building, in Pittsburgh, was awarded to Murphy & Hamilton for \$155,303. The contract embraces every detail necessary to a complete fire-proof building. The work is to be commenced not later than October 1 and is to be finished in seven months from that date.

China now has an effective navy, comprising four armored ships and eight unarmored, all built in Germany within the past five years, also four cruisers, including two in course of construction in the extensive dock yards at Foo Chow and near Shanghai. All the new vessels are fitted with the most approved appliances known to modern warfare, fully abreast of the times.

A correspondent in Bombay, alluding to the production of Indian cotton goods, says that the competition is becoming more keen every year, since, owing to the cheapness of labor in India, the manufacturers in that country can produce and sell their goods at the lowest possible price. An idea of the rapid growth of this industry in India is afforded by the fact that in 1865 there were only 18 spinning mills in the Presidency of Bombay, whereas at the present moment there are 70, and the num-

ber of spindles increased during the period in question from about 285,000 to nearly 1,750,000. The number of looms now at work may be reckoned at nearly 15,000, against 3579 in 1865. The annual consumption of raw cotton now amounts to about 486,000 bales. In all India there are at present 95 cotton-spinning mills and weaving establishments, containing 2,250,000 spindles, 17,500 looms, and affording employment to nearly 75,000 hands.

The new treasury vault at Washington is a great subterranean apartment about 60 x 40 feet square and 15 feet high, and, when filled with silver dollars about six months hence, will contain \$100,000,000 of treasure. The old vault adjoining is brim full and contains \$90,000,000, mostly in silver. The Queen of Sheba would be more than astonished if she could view the spectacle.

The electric lights on the Brooklyn Bridge, like that removed not long ago from Hell Gate, are the subject of complaint by navigators who object to their dazzling effect. The Light House Board claim to have jurisdiction in the matter and propose to shade the lights, thereby removing objections, but the Bridge Company do not recognize the authority of the board, so that it remains for the United States Attorney-General to take such action as may be deemed necessary.

India will not very soon displace China in the tea trade. The annual report of the Imperial Maritime Customs, of China, for the year 1887, shows that the competition of its Indian rival has really had but little, if any, effect upon its tea trade, for there has been only an insignificant falling off in the total exports for the year. The total exports for the calendar year amounted to 2,096,097 piculs, against 2,217,295 piculs in 1886, a falling off of only 120,000 piculs or about 5 per cent. A much greater difference is shown in a comparison of values for the two years, the exports in 1886 being valued at 33,504,820 taels, while last year they amounted to only 29,379,838 taels, which is due, of course, to the comparatively low prices that prevailed last year. In the light of these figures there seems to be very little cause for apprehension that the tea trade is to be seriously disturbed, since Great Britain is almost the only market for the India product.

An event in Congress was the action of the House in passing the Senate bill amendatory of the Interstate Commerce law. As the bill came from the Senate, it carried out several of the recommendations of the Interstate Commerce Commission in the way of strengthening and simplifying the law. The bill, as it passed the House, carries a number of important amendments conferring concurrent jurisdiction upon United States and State courts as to complaints under it and requiring the Interstate Commerce Commission to prescribe for common carriers one uniform rate of classification, which shall be transmitted to the common carriers before the first Monday in July, 1889, and any violation of this classification shall be deemed unreasonable rates. The Commission is required to execute all the provisions of the law, and, upon its request, the Attorney-General of the United States shall institute and prosecute all necessary proceedings in the proper court for its enforcement. The final amendment makes it unlawful for any common carrier subject to the provisions of this act to carry refined oils and other petroleum products, cotton-seed oil and turpentine for any shipper in tank or cylinder cars, who shall own, lease or control the same in any manner, except upon the condition that said carrier shall charge the same rate for the transportation of said products in wooden packages or barrels, in carload lots, as in said tank or cylinder cars, the said tank and cylinder and said wooden

packages and barrels being carried free in each case. Senator Cullom, who carried the bill through the Senate, said he thought some of the amendments would endanger the passage of the bill at this session if insisted on. He will move, when the bill reaches the Senate, to nonconcur in the amendments and ask a committee of conference. He believes that the matter can be put in such a shape in conference as to meet the approval of both houses.

A steel steamer to carry about 3500 tons of iron ore has been contracted for in England, to ply between Philadelphia and St. Jago de Cuba, in the Earn steamship line. She will be called the Earnfoard, and have triple-expansion engines.

A Pittsburgh firm have received an order from Mexico for 25,000 fire-brick, to be used in the construction of a charcoal blast furnace in Durango. The cost of delivering the brick will be \$250 per 1000. As the railroads do not extend nearer than 100 miles of the place where the furnace is to be built, it will be necessary to transport the brick that distance in wagons and on jackmules.

It is reported from Ottawa that the retaliation proposal has caused the successful floating of an \$8,000,000 scheme, which includes the purchase of the North Shore Line from Quebec to Ottawa and the extension of the Pacific Railway from there to Sault Ste. Marie, thus giving direct railway connection between Lake Superior and the seaboard.

Cutlers' Hall, in Sheffield, England, has been nearly doubled in capacity this year, with an improved banqueting-room, extensive lavatory, drawing-room, &c.

The Treasury Department have decided that nail files, and nail cleaners with metal files, are dutiable at the rate of 45 per cent. ad valorem as manufactures of metal and bone; also, that articles commercially known as botton shanks (being small brass cups into which the molds are set in the manufacture of buttons) are dutiable at the rate of 45 per cent. ad valorem as manufactures of brass; also, that goods known as "wool back worsted coatings," composed of wool and worsted, are dutiable at the rate of 35 cents per pound and 40 per cent. ad valorem as manufactures of wool.

The recent cyclone in Cuba proves to have been frightfully destructive. Aside from the destruction at Cardenas, Havana, and other seaports, the tobacco crop suffered severely, and throughout the island over 3000 buildings of various kinds were prostrated. The aggregate loss is estimated at \$10,000,000, and over 800 persons were killed. The loss of life in Sagua alone is about 400.

An exposition is to be held at Berlin, Prussia, from April to June, 1889, of machinery, apparatus of all kinds now in use to guard against accidents, tools, working materials in models; of plans, drawings, photographs and specifications; of copies of regulations, rules for factories, and printed matter relating to accidents and their prevention. All articles that relate generally to the protection of laborers and to the promotion of their welfare and safety while at work will be accepted, and the invitation to participate is extended to all nations. Consul-General Raine in a report to the State Department, dated May 4, 1888, furnishes a copy of the regulations to govern the exhibition, from which it appears that devices for ventilation of workshops and many other things which at first sight were hardly considered as belonging to an exhibition for the prevention of accidents are included. Applications made after July 1, 1888, long since passed, it is stated, will be considered only if any vacant space remains.

MANUFACTURING

Iron and Steel.

Rebecca Furnace, of the Kittanning Iron Company, Limited, at Kittanning, Pa., which has been idle for some months, was blown in last week, with good prospects for a steady run.

Fanny Furnace, operated by J. C. Hamilton, Shawnee, Ohio, trustee, will resume operations in a few weeks. A new bosh has been put in, general repairs have been made, and a new brick casting house, 37 x 85 feet, is being put up to replace the old one, recently destroyed by a wind storm.

W. B. Pollock & Co., of Youngstown, Ohio, manufacturers of boilers and all kinds of rolling-mill and blast-furnace work, have been awarded the contract for all the ironwork entering into the construction of the hot-blast stoves to be erected at the Tod Furnace of the Brier Hill Iron and Coal Company, at Youngstown, Ohio. The contract is quite a large one and will keep the firm busy for some time to come.

After a long idleness the plant of the Etna Iron Works, Limited, at New Castle, Pa., was started up in full in all departments except the rail mill on Monday, the 10th inst. The works are being operated by A. W. Thompson, who has a lease of the same.

D. W. C. Carroll & Co., of Pittsburgh, on the 14th inst. closed a contract for the erection of two iron viaducts for the city of Denver, Col., to cross the railroads, which all center in one part of that city. One viaduct is to be 376 feet long and 32 feet high, and the other 785 feet long and 32 feet high. The viaducts are to be made of structural iron, including the approaches. They will be of sufficient width to allow of a driveway and two footpaths. The viaduct cost \$97,000 and the approaches \$21,000 additional.

Bids for building the superstructure of the Seneca street bridge, Cleveland, were opened in the office of the Board of Improvements last week. There were five proposals, two of the bids being informal. The bidders were required to furnish figures for the 215 tons of iron and 35,000 feet of lumber required. The Pittsburgh companies did not furnish any sureties and, although their bids were recorded they were not considered. The bid of the Variety Iron Works was the lowest, the price for the iron being \$74.50 per ton and for lumber \$30 per 1000 feet. The King Iron Bridge and Manufacturing Company offered to furnish the iron for \$96 per ton and the lumber for \$28 50. The Detroit Bridge and Iron Works bid \$105 per ton for the iron and \$33 per 1000 feet for the lumber. The totals are as follows:

Variety Iron Works.....	\$17,067.50
King Iron Bridge and Mfg. Company..	21,607.50
Detroit Bridge and Iron Works.....	23,730.00
*Pittsburgh Bridge Company.....	26,790.00
*Shiffer Bridge Works, Pittsburgh.....	27,052.50
*Informal.	

The contract for the substructure has already been let at \$46,000, and the engine house yet to be built will cost \$5000, making the total cost of the structure about \$70,000.—Cleveland, Ohio, Trade Review.

The Wayne Iron and Steel Works, of Brown & Co., at Pittsburgh, have been closed down for the past two weeks, on account of a strike of the workmen. Recently two pieces of steel were spoiled and the firm demanded that in the future the heater shall be held responsible for such losses. To this the men would not agree and a shut-down was the result. It is expected that the matter will be amicably arranged during the present week and operations resumed again.

The new plant of the Allegheny Bessemer Steel Company, at Duquesne, Pa., about 25 miles from Pittsburgh, is rapidly nearing completion, and is expected to be ready for operations by January 1. The Bessemer department is already finished and filled with the most improved modern machinery. In the rail mill hydraulic working machinery will in nearly every instance take the place of roll-hands, furnacemen, shearsmen, and hot-bed men.

Norway Furnace, at Bechtelsville, Pa., operated under lease by Gabel, Jones & Gabel, of Pottstown, Pa., is at present undergoing extensive repairs. It will resume blast about November 1, next.

The Advance, of Latrobe, Pa., says concerning the steel plant to be erected there: "After a large amount of preliminary labor, such as drafting, corresponding, and making preliminary arrangements, P. J. Dalton has secured the contract for the foundation work of several large buildings and will put his men to work at an early day. Bids for the ironwork of the buildings are in from a number of firms, as are also bids for the construction of the greater part of the machinery. When work is once commenced the buildings will be put up rapidly."

The plans of the building to be erected at Washington, Pa., by the Novelty Steel Wheel Company, of Pittsburgh, have been finished, and the contract for the building will be let during the present week. As was stated in *The Iron Age* of last week, the company will manufacture steel wheels exclusively for wagons, buggies, &c. About 200 hands will be given employment by the new firm, and the works are expected to be ready for occupancy by January 1, next.

The Henderson Steel and Mfg. Company, of Birmingham, Ala., have increased the capacity of their 14-ton experimental open-hearth furnace to 3½ tons. The first melt in the enlarged furnace was successfully made on the 22d of August.

It is understood that if the Laclede Plate and Sheet Mill Company secure another lease on the Laclede Rolling Mills they will order improvements of the value of \$20,000 or \$25,000, to better adapt the mill to the requirements of the rolled iron trade of the West, and of this locality more especially. It is undecided as yet, however, which of the three interests offering to take the property under a lease will secure it, though the matter is expected to be settled in a week or two. But it is quite safe to say that, in any event, the mills will be operated this winter.—*Age of Steel, St. Louis.*

No. 5 furnace of the Thomas Iron Company, at Hokendauqua, Pa., is undergoing extensive repairs and will be ready soon for blast again.

The employees of the American Iron Works of Jones & Laughlins, Limited, at Pittsburgh, have organized a beneficial association. None but those employed in the machine shop, polishing mill, foundry, chain factory, bolt factory and pattern shops and roll turners are eligible to membership in the new organization, which will pay to a sick or disabled member incapacitated for work \$5 per week, and, in case of the death of a member, \$100 to pay funeral expenses. The association have an initial membership of 150.

James P. Witherow, engineer and contractor, of Pittsburgh, whose works are located at New Castle, Pa., has received the contract for the erection of the buildings for the plant of the Latrobe Steel Company, at Latrobe, Pa. The buildings will be made of wrought iron and will be fire-proof. The dimensions of the open-hearth steel department will be 250 x 80

feet. Connecting with it will be an L the same length and 40-foot span. The hammer shops will be 350 feet long, with an 80-foot span, and will have an L the same length and 40-foot span. The company will manufacture tires for all kinds of wheels. About 300 men will be given employment. The projectors of the enterprise are Eastern capitalists.

Some time ago P. L. Kimberly & Co., Limited, proprietors of the Atlantic Iron Works, at Greenville, Pa., made a proposition to their workmen to work six weeks and then receive two weeks' pay, and pay every two weeks thereafter. This proposition has been accepted and the plant, which has been idle for some months, has resumed operations in nearly all departments. The principal product is cotton ties, about 60 tons per day being the present output. The works contain 26 puddling furnaces, 4 heating furnaces and 1 8-inch and 1 10-inch train of rolls.

The Rogers Foundry Company, Belleville, Ill., have been awarded an increase of contract for cable yokes for a Denver street railway. This line of work has become a leading specialty with them, and they are now getting ready to increase their output of yokes from 125 a day, as at present, to 150.

The Bouton Foundry Company have sold their extensive architectural iron works, on Archer avenue, Chicago, to a railroad company, whose line will pass over the site. Under the conditions of the sale the Bouton Foundry Company are given a year in which to select a location elsewhere, so that they will suffer no interruption to their business by reason of the enforced removal. They are now considering the relative advantages presented by several choice locations, but have not yet determined which of them will be selected.

G. A. Millard, of Indianapolis, Ind., has opened an office at 14 Vance Block, for the sale of pig iron and coke, copper, tin, antimony, old wheels, old rails, steel rails, blooms, billets, slabs and wire rods.

Machinery.

The largest cotton press ever built at the works of the Scott Foundry and Machine Company, Limited, at Reading, Pa., was shipped to Brunswick, Ga., last week. The press weighs 230 tons, standing on a base 12 x 24 feet, connecting with four links 38 feet long and each weighing 9 tons. One of the castings of the press weighs 25 tons.

The Bethlehem Steam Heating Company, of Bethlehem, Pa., is the name of an intended corporation, which has applied to the governor for a charter.

The Southern Pacific Railroad Company have purchased a combined arc and incandescent plant, consisting of eight double lamps, twenty-four 25 C. P., and ten 100 C. P. lamps to light their station and surroundings at Los Angeles, Cal., using the Waterhouse system controlled by the Waterhouse Electric and Mfg. Company, of Hartford, Conn.

The works of the Russell Mfg. Company, brass founders and machinists, of McKeesport, Pa., which have been idle for some time past, resumed operations on Monday the 17th inst. S. M. Highlands, who has been with the American Water Works Company for a number of years, has been secured as general manager, and it is expected that the works will continue in operation, as the firm have a number of large orders on hand.

Among their late sales the Ball Electric Light Company, of New York City, report the following: 100 arc lights and 200 incandescents, through their Mexican agents, I. Aguirre & Bros., for Toluca,

Mexico. 35 arc lights (increase) to the National Worsted Mills, Providence, R. I. 70 arc lights to W. A. Walton & Co., Wood River Junction, R. I. Hartford Electric Light Company, Hartford, Conn., 200 arc lights (increase). Jersey City Electric Light Company, Jersey City, N. J., 50 arc lights (increase). Novelty Electric Company, Philadelphia, Pa., 25 arc lights. Clarksburg Electric Light Company, Clarksburg, W. Va., 70 arc lights. Pennock Bros., Minerva, Ohio, 25 arc lights. J. L. Bueron, Quezaltenango, Central America, 210 arc lights, and 350 incandescents. Muncie Electric Light and Power Company, Muncie, Ind., 25 arc lights. Consolidated Coal and Iron Company, Wellston, Ohio, 26 arc lights. Ball Electric Light Company, of Cincinnati, Ohio, 30 arc lights (increase). Manton Mills, Manton, R. I., 70 arc lights (increase).

The new works of the Cleveland Twist Drill company at Cleveland, Ohio, are rapidly approaching completion, and will probably be occupied by the firm early in November next. The main building is 100 x 40 feet, with tempering and forge shops adjoining. New machinery will be added to keep up with the increase in business.

The Westinghouse Electric Company, of Pittsburgh, are at present at work on a plant for a town on the Pacific coast near San Francisco. There will be 1300 lights put up as soon as possible, together with the necessary engines, dynamos, &c., and the plant will be in operation in the course of a couple of months.

The Pittsburgh, Fort Wayne and Chicago Railroad Company have recently added to their equipment four engines, which weigh 65 tons each. These engines are calculated to make the run between Alliance and Crestline, over 100 miles, without stopping for coal or water.

The Kimble Steam Engine Company have been organized at Kalamazoo, Mich. It has an authorized capital of \$100,000, of which \$75,000 have been paid in. It will give employment to several hundred men.

The Canton Car Company, of Canton, Ohio, will change their name shortly to the J. H. McLain Machine Company.

Eynon & Marshall, engines builders and machinists, of Cleveland, Ohio, are receiving numerous orders for their slab-milling machine. On account of an increase of orders the company have been compelled to erect a new factory, which they expect to occupy in November next.

The Western Mfg. Company, of Lincoln, Neb., have recently been incorporated under the laws of the State of Nebraska, and the following officers have been elected to take charge of its affairs from and after this date: J. F. Barnard, president; H. J. Walsh, vice-president; M. D. Welch, secretary and treasurer; W. W. Marsh, superintendent of shops. Mr. E. Hurlbut, Jr., the former manager, retired from the company on the 1st inst. The company manufacture farm machinery. They write us also that they have recently added a cooperage department to their works, and have now a capacity of 500 barrels or tierces per day, and are prepared to fill all orders for above goods.

Hardware.

It is stated that Col. S. F. Scott and C. P. Deatherage have purchased a two-thirds interest in the machinery of the Harrison Wire Works, St. Louis, the other third being held by James C. Anderson, Chicago. It is also announced that the machinery will be moved to Kansas City, Mr. Anderson managing the concern.

The Ludlow-Saylor Wire Company, St. Louis, Mo., have added to their plant facilities for doing electro-bronze plating. They have just completed some elegant work for the new Mercantile Library building in the way of artistic brass elevator inclosures and iron grilles for library room. They have also recently furnished the American Central Insurance building with brass elevator inclosures and electro-bronze work in their office, besides some other large jobs for banks and buildings throughout the West and South.

The Iowa Farming Tool Co., Fort Madison, Iowa, are putting in a plant for the use of crude oil as a fuel, instead of anthracite coal. The expense attending this departure is considerable, but it is anticipated that it will give better results, and diminish the cost of producing the goods.

L. B. Heller & Co., Montreal, announce that they have commenced the manufacture of Horse Raps and Files having the brand "L. B. Heller," the work being under the personal supervision of L. B. Heller, who was formerly connected with Heller & Bros., Newark, N. J., the two houses being, however, entirely distinct.

The Celina Tack and Nail Company have been incorporated at Celina, Ohio, with a capital stock of \$20,000. B. S. Taylor and others are the incorporators.

Miscellaneous.

The Reading Coal and Iron Company are considering the advisability of sinking a shaft midway between the Potts and Keystone collieries, near Ashland, Pa. It is claimed that the vein which would be tapped is 35 feet in thickness, and would not be exhausted for half a century. Recently the company extended its operations in the East Franklin colliery, which had been abandoned as of little value, and struck a heavy vein of hard anthracite of excellent quality. As soon as the breaker and shaft shall have been put in good condition mining operations will be commenced.

The Star Fire-Brick Company, of Pittsburgh, have just closed a contract for 25,000 fire brick, to be delivered at Durango, Mexico. They will be used in the construction of a charcoal blast furnace to be built by the Mexican Iron Mountain Mfg. Company. The cost of delivering these brick will be about \$250 a thousand. As the railroads do not extend nearer than 100 miles of the place where the furnace is to be built, it will be necessary to transport the brick that distance in wagons and on jack mules. This firm are also filling an order for 250,000 brick for the Isabella Furnace Company. They will be used in rebuilding furnace No. 2, which is now in blast, but will be blown out some time this fall. The same firm have an order for 300,000 brick, which will be used in relining Lucy Furnace No. 2.

Edw. D. Bolton, of the firm of T. William Harris & Company, 44 Broadway, New York, has been appointed consulting engineer for Asheville, N. C., in connection with their sewerage system, upon which it is proposed to expend \$100,000. John G. Aston, the city engineer, will be the resident engineer.

The Common Sense Stove Polish Company have succeeded Gana & Martin, manufacturers of stove polish and shoe blacking, 270 West Randolph street, Chicago. They are distributing to purchasers of their common sense stove polish copies of Munkacsy's celebrated painting, "Christ before Pilate." It is a photo-gravure, 11 x 14 inches in size, and said to be the best copy of this famous work now in the market. A copy of the picture double this size, 22 x 28 inches, is given to each dealer for his personal use.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., September 18, 1888.

Pig Iron.—The market has shown a hardening tendency during the week, and in the majority of cases buyers would have to pay a little more money for desirable brands. There is no quotable change in the general market, but inside prices, such as \$16 for Gray Forge, \$17 for No. 2, and \$18 for No. 1, are now very exceptional, and are hardly taken into consideration by those who control good Irons. But consumers make no great effort to place orders, as they are generally pretty well provided for, and are more inclined to await developments than to pay advances on material which may not be required for two or three months to come. Sellers, for the same reason, have plenty of orders on their books, and if belated buyers must have Iron they have no alternative but to pay the advance, averaging, perhaps, 50¢ per ton from the lowest. Consumption is large, and the general position is very satisfactory, but it is hardly likely that prices will be marked up again, for the present at all events. Production is increasing, the change as shown by last week's *Iron Age* being at the rate of 6000 tons per week increase, comparing September 1 with August 1. Then there are intimations of a further increase in the South at an early date, so that it is not merely a question of absorbing the present output, but several thousand tons per week on the top of that. If prices remain as they are the increased supply may not be as much, but a dollar a ton on the price means a great deal more Iron for sale, but there is no reason to suppose that it will make consumption any the greater. For these and other reasons the trade are by no means inclined to pay fancy prices. They will take liberal quantities at the old figures, but only such small lots as they must have at the higher prices. Meanwhile sales are being made on the basis of \$16 @ \$16.50 at tide for Gray Forge, \$17.50 @ \$18 for No. 2, and \$18.50 @ \$19 for No. 1. In exceptional cases a few orders may have been taken at \$16, \$17 and \$18, but they would not be fair quotations in the present condition of the market, which, as already stated, is unusually strong without being feverish or excited.

Foreign Iron.—Prices are purely nominal, as consumers can do much better on domestic Irons. Sellers quote \$20 @ \$20.50, c.i.f., duty paid, for Bessemer and \$26 @ \$26.50 for 20 % Spiegel, but there are no bidders at anything near these figures.

Blooms.—A good demand is reported, and prices are firm at about the following quotations: Nail Slabs, \$20 @ \$29.50; Billets from \$30 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 per "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29.50 @ \$30.50 for Nail Slabs; \$32.50 @ \$34 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—Prices are very firm at about \$29 @ \$29.50, delivered, with quite a large business at figures equivalent to \$29, Philadelphia. There is still a good deal of inquiry and bids at about \$28.75 for large lots, but holders are not inclined to make concessions.

Bar Iron.—The mills have taken in a good many orders of late, and are so comfortably situated that they are very firm in quoting on new business. Probably

1.85¢ might be accepted for good-sized orders, but some of the leading mills quote 1.9¢ @ 1.95¢ firm and there is no doubt that the tendency is steadily in sellers' favor. Inquiries are in the market from car-builders, and it is thought that some important additions to the work on hand will be made before the end of the month. Skelp orders are also on the market, with sales at 1.85¢, although 1.87½¢ @ 1.9¢ is asked for early deliveries. Taking the market as a whole, the position is decidedly favorable to sellers, and, while no important changes in prices are expected, there seems to be plenty of business and firm prices, varying, as we have said, from 1.85¢ to 1.9¢ for strictly good iron.

Plate and Tank Iron.—A good business is reported at all the mills in this vicinity. Prices are firm, but not higher, although a little more pressure in the demand would soon lead in that direction. The mills seem to have plenty of work up to November and the indications are very promising for a good demand during the latter portion of the year. Prices are firm as last quoted: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—No large orders are offering at the moment, but the mills are kept fairly busy on old contracts, and with such small lots as are called for from day to day. There is nothing in the outlook calling for special remarks, business being rather quiet, but manufacturers appear to feel hopeful of renewed activity in the near future. Prices are steady as last quoted—viz.: 2.10¢ @ 2.15¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The demand is not up to expectations, although the mills appear to find a market for their product, and are not accumulating stock to any extent. Prices are nominally unchanged, but in some instances very low figures have been named. Small lots of the best make are quoted about as follows:

Best Refined, Nos. 26, 27 and 28.... 3½¢ @ 3½¢
Best Refined, Nos. 18 to 25.... 3¢ @ 3½¢
Common, ¼¢ less than the above.
Best Sheet Iron, Nos. 26 to 28.... 4½¢ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25.... 4¢ @ 4½¢
Best Bloom Sheets, Nos. 16 to 21.... 3½¢ @ 3½¢
Blue Annealed..... 2.8¢ @ 3¢
Best Bloom, Galvanized, discount..... 62½¢
Common, discount..... 67½¢

Merchant Steel.—There is an increased demand for the better grades, and prices show considerable firmness. Lots from store are quoted as follows: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Open-Hearth Ordinary Spring, 2.7¢ @ 2.9¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—The market is very quiet, and there is not much reason to expect improvement in the near future. Steel, in other shapes, however, is in good demand, so that the mills are doing fairly considering the light demand for Rails. Prices are nominally \$29 at mill, but on desirable orders more or less shading would be done.

Old Rails.—Not a single transaction to report in this market. Holders of lots in store decline to name prices at present, but bids of \$23 to \$23.50 have been made but not accepted, as the parties expect to get more money for them later on.

Scrap Iron.—In good demand at about the following prices: \$20.50 @ \$21 for cargo lots; \$21.50 @ \$22 for carload lots, delivered, or for choice \$22.50 @ \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap,

\$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—Business continues quite active, and all sizes of Pipe are in good demand, although prices do not improve to any great extent. Discounts are quoted as follows: Black Butt-Welded, 55 %; on Galvanized do., 45 %; on Black Lap-Welded, 65 %; on Galvanized do., 52½ %; on Boiler Tubes, 60 %.

Nails.—The general situation remains in about the same condition as noted last week. Stocks are accumulating preparatory to the fall trade, which at the moment looks like being a large one. It is intimated that Nails are being sold in and around Philadelphia at ruinous prices—some say as low as \$1.70 at mill. Lots from store are quoted at from \$1.90 to \$2.

Cincinnati.

CINCINNATI, September 17, 1888.

Pig Iron.—The local market for Pig Iron during the past week has been active and strong, with full values realized, but there has been no advance of moment, nor is one desired either by buyers or sellers at present. Individual sales have again been large, and the aggregate transactions have probably been in the neighborhood of 25,000 tons. All grades of Mill Iron have been sought, and there are very few brands of Foundry Iron which have not sold well. Ohio furnaces which accumulated Iron during the prevalence of low prices during the past summer have proved their wisdom and reaped a harvest, and not only have they disposed of stocks on hand, but have obtained large orders for delivery throughout the remainder of the year. At the moment, however, the feature of interest is the sudden and pressing demand for Car-Wheel Iron, both Southern and Northern production. With reduced stocks and increased consumption even in advance of the larger output, the confidence of sellers is apparently well guaranteed. Buyers tacitly admit the strong situation, but official returns are looked for with unusual interest. Among the large transactions have been 5000 tons No. 2 Southern Forge, 2500 No. 2 Southern Coke Foundry and 1000 tons Southern Car-Wheel, all on basis of quotations. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$17.50 @ \$18.50
Southern Coke, No. 2.....	16.50 @ 17.50
Southern Coke, No. 3.....	15.50 @ 16.50
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley.....	17.50 @ 18.50
Hanging Rock Charcoal, No. 1.....	20.50 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.50 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @ 19.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	14.75 @ 15.25
Mottled Neutral Coke.....	13.50 @ 14.00
No. 1. Mill Coke.....	15.00 @ 15.50
No. 2 Mill Coke.....	14.50 @ 15.00

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 23.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

Manufactured Iron.—Foundries and rolling mills are reported well supplied with orders, and a firm tone prevails for all kinds of Manufactured Iron. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3½¢ @ 4½¢ per lb.

Nails.—The jobbing prices have been advanced 10¢, with a fair demand, and there is some talk of a further advance of 10¢, but it is not generally obtained. Job-

bing prices are based upon 12d @ 40d, which sell at \$2.10 $\frac{1}{2}$ keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2.10 and Steel Wire Nails at \$2.75 $\frac{1}{2}$ keg.

Old Material.—The importunities of buyers of Old Rails have increased rather than otherwise, but the offerings are small, and in the absence of trading no reliable quotations can be given, but \$25 seems to represent the market. Old Wheels, too, are scarce and wanted, and nominally quotable at \$22, spot.

Chicago.

Office of The Iron Age, 96 and 97 Washington St., CHICAGO, September 17, 1888.

Pig Iron.—The market has been quiet as compared with previous weeks, though a few good sales are reported, varying from 500 to 1000 tons each. It is believed that the leading consumers of Pig Iron in this vicinity have now nearly all placed contracts for the minimum quantity which they will need up to the close of the year. If their trade improves they will be obliged to increase their purchases, but at present the indications are not very favorable to an expansion of business on this account. The railroad companies are still economizing as much as possible, the architectural foundries report new work scarce, with almost a total lack of large building operations, and general foundries are running very light. The hand-to-mouth buying which is always in progress may be sufficiently large in volume, however, to absorb the furnace output still unsold and to maintain prices at the recent advance. This view is strengthened by the fact that some furnace companies hitherto holding back have lately pushed up their rates in line with the others. Stocks at the furnaces are diminishing, although production is increasing. There was a reduction in August of 19% in Coke stocks and over 9% in Charcoal. While it is possible that new influences may come into play which will revive the demand for Pig Iron and cause another upward movement, it is worthy of note that the market is now halting with no special tendency in either direction. Changes in the prices of particular brands may be rendered necessary by the advances in freight rates from points of production to this market. For instance, a new tariff is shortly expected on Pig Iron from the Mahoning and Shenango valleys. The present rate is \$2.25 $\frac{1}{2}$ ton, and the new rate will probably be \$2.50. On October 1st an advance of at least 25¢, and possibly 50¢, is expected in the freight rates on Southern Pig Iron. These changes inure to the benefit of local furnaces, whose prices have been kept down in order to hold their share of the market against outside competition. Very little is now being done here in Southern Pig Iron, particularly as the prices quoted for such brands as are not sold up are too high to result in business. Cash quotations, f. o. b. Chicago, are as follows: Lake Superior Charcoal all numbers, \$19.50 @ \$20.50; Alabama Car-Wheel, \$26.25; Southern Charcoal Foundry, No. 2, \$18.50; Jackson County Softeners, No. 1, \$18.25 @ \$18.75; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband) No. 1, \$19 @ \$20; other Ohio Scotch Irons, No. 1, \$18 @ \$18.50; Lake Superior Coke, No. 1, \$17.50 @ \$19; No. 2, \$16.50 @ \$17; No. 3, \$15.50 @ \$16; Southern Coke, No. 2, \$17.75 @ \$18; No. 2 $\frac{1}{2}$ and Ohio Bright, \$17.25 @ \$17.50; No. 3, \$16.75; No. 1, Mill, \$16.50.

Bar Iron.—Numerous inquiries are reported from would-be buyers at past prices, but they hesitate about making contracts for large quantities at the figures now named by the manufacturers. The usual quotations are 1.75¢ @ 1.80¢, half extras,

f. o. b. Chicago, for carload lots of Common Iron, with a very few mills willing to shade the lower figure, while others ask 1.85¢. The firm attitude maintained by the Mahoning Valley mills would seem to indicate that they find better markets than Chicago for the bulk of their output. The Pittsburgh mills evidently are in the same condition, as they quote as high a price, f. o. b. mill, as the ruling Chicago quotations. Jobbers have advanced their rates on small lots, from store, to 1.90¢ @ 2.10¢ for Common Iron.

Structural Iron.—The approaching close of the season is affecting the demand both for building and bridge work, and a limited business in this material is in progress, with some effect on prices. Mill lots are quoted as follows, f. o. b. Chicago: Angles, 2.25¢; Universal Plates, 2.30¢; Tees, 2.55¢; Beams and Channels, 3.40¢. Store prices continue at 2.40¢ @ 2.50¢ for Angles; 2.60¢ @ 2.70¢ for Tees, and 3.80¢ for Beams.

Plates, Tubes, &c.—An active business is reported in Plates, but the transactions of the week have been mainly in small lots. Quotations are firm but unchanged, as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60% @ 65% off on 2 $\frac{1}{2}$ -inch and larger, and 62 $\frac{1}{2}$ % off on 2-inch and smaller.

Sheet Iron.—Large buyers seem to have about covered their requirements for the season. Mill representatives report but light sales and on these they have exacted still higher prices, now quoting No. 27 at 3.10¢, at mill, or 3.25¢, f. o. b. Chicago, but this price can, of course, be shaded on favorable deliveries. Jobbers have been compelled to advance their prices and now ask 3.20¢ for No. 24, 3.30¢ for Nos. 25 and 26 and 3.40¢ for No. 27, in small lots. A concession is made to best buyers.

Galvanized Iron.—The demand keeps up very well and manufacturers' agents are now sending even small orders to the mills because of their inability to fill them from their depleted stocks. The manufacturers selling cheapest have marked up their prices to the rates maintained by their colleagues and the jobbers have been obliged to follow suit. Quotations for small lots are now 60% off for Juniata and 60% and 5% off for Charcoal.

Merchant Steel.—Some deferred contracts were placed during the week by Agricultural Implement manufacturers, but otherwise the local market was without special feature. A fair jobbing trade is in progress. Prices from store are firmly maintained, as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8 $\frac{1}{4}$ ¢ @ 9 $\frac{1}{4}$ ¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Some small orders were taken during the week, but the manufacturers still report the condition of their branch of trade far from encouraging. Nevertheless, inquiries are increasing, and it would not be surprising if a decided change in tone should occur within the next four weeks. Railroad companies are asking for quotations on round lots, part to be delivered this fall and part next spring. The manufacturers prefer not to quote for next year, but are anxious to get all the orders they can for this year, and believe that orders will be placed on that basis when the railroad companies realize that they have taken a firm stand. Quotations are nominally \$30 @ \$31.

Old Rails and Wheels.—The excitement in Old Iron Rails seems to have sub-

sided for the present, but prices have not receded. Transactions are reported at rates ranging from \$24.50 to \$25.35. The supply is still limited, but apprehensions of great scarcity have been dissipated by the continual offerings made by railroad companies, who are collecting Old Rails from all along their lines to take advantage of the high prices now obtainable. Old Steel Rails are more active. A dealer secured 1000 tons at \$17.50, as they run. Consumers have paid from \$19.50 to \$21 for selected. Old Car-Wheels are subject to singular fluctuations, probably caused by preferences for particular makes. Small sales are reported at prices ranging from \$18.50 to \$20. The ruling rate is about \$19.50. The largest transaction reported is a sale of 250 tons at private terms.

Scrap.—Business has been fair among the local dealers, particularly in Wrought. For Cast the demand is quiet. The stock of Steel Scrap has been pretty well cleaned up. Inquiries for Wrought show that consumers are looking about for stock, and dealers are advancing their prices, in consequence of the renewed interest shown. Quotations for carefully selected are as follows, $\frac{1}{2}$ ton of 2000 lb: No. 1 Forge or Railroad Shop, \$20 @ \$20.50; Track, \$18.50; No. 1 Mill, \$15 @ \$15.50; Light Wrought, \$11; Horseshoes, \$18; Axles, \$25; Cast Machinery, \$13.50 @ \$14; Stove Plate, \$11; Cast Borings, \$9; Wrought Turnings, \$11; Axle Turnings, \$13; Coil and Leaf Steel, \$16; Locomotive Tires, \$16.50. Dealers are now offering \$13 @ \$14 for Mixed Country Scrap.

Hardware.—The demand for Heavy Hardware is very fair, while in Shelf Hardware there is a seasonable improvement, in which, however, some houses seem to be favored with a larger share than others. The demand is quite general, but a specially free movement is reported in Tools, Builders' Hardware, Screws, Nuts and Bolts. Prices are firm and in a few cases an upward movement is reported. Stove Boards have stiffened up to 60% off for Crystallized, and other kinds at corresponding rates, with somewhat of a scarcity in the supply. Solder is now held at 17¢ @ 18¢ for strictly half and half. Collections are very good for the season.

Nails.—Manufacturer's agents have had a quiet week, evidently doing but little to push trade. They quote prices on Steel Cut Nails at \$1.95 @ \$2.02 $\frac{1}{2}$ in large lots, f. o. b. Chicago. Jobbers also report but a limited demand, with small lots held at \$2.10 for Steel and \$2.65 for Wire Nails.

Barb Wire.—The demand is slowly improving, but as yet trade is confined almost wholly to small lots, very few carloads being called for. Manufacturers are receiving inquiries from heavy buyers, but their views as to prices are not close enough to result in immediate business. Nominal prices for small lots are still 3¢ for Painted, and 3.75¢ for Galvanized.

Pig Lead.—Consumers are believed to have secured about 500 tons of spot Lead during the week, at 4.80¢. The speculative demand has ranged from 4.80¢ to 4.85¢. At the close 4.75¢ was the best bid. Manufacturers of Lead Pipe and other Lead products state that the advances they have been obliged to make in consequence of the increased cost of Pig Lead has not restricted their trade, but they are compelled to watch the market very closely in order to secure themselves against possible reactions.

Louisville.

LOUISVILLE, KY., September 17, 1888.

Pig Iron.—The market continues firm, and advices from other points indicate that present prices of Iron are being held up. Where parties desire large blocks of

Iron for immediate delivery it is difficult to place orders, as furnaces generally are largely sold up to January. Silver Gray Iron continues very scarce, and but few Southern furnaces are able to furnish Iron of this quality. It is thought, however, that as soon as the wet season begins this grade of Iron will be more abundant. There is a movement on foot among Southern furnaces to change the grading of Iron, and make same correspond with the grading of Iron East. As,

No. 1 Foundry to be present No. 2 Foundry.
No. 2 " " " " No. 2 " "
No. 3 " " " " No. 1 Mill.
Gray Forge " " " " No. 2 " "
No. 1 Bright " " " " Open Bright.
No. 2 " " " " Medium or Close Bright.

Silver Gray Mottled and White to remain the same.

None of the new furnaces have yet come in blast, and it is difficult to tell when they will be making Iron, though it is thought some time during the course of the next 60 days. Current quotations are as follows:

Southern Coke, No. 1 Foundry....	\$17.00 @	\$18.00
" " " " " " " "	16.00 @	16.50
" " " " " " " "	15.50 @	16.00
Hanging Rock Coke, No. 1 Foundry....	17.25 @	17.75
" " " " " " " "	21.00 @	23.25
Southern Charcoal, No. 1 Foundry....	18.00 @	18.50
Silver Gray, different grades....	14.50 @	15.25
Southern Coke, No. 1 Mill, Neutral	14.75 @	15.25
" " " " " " " "	13.75 @	14.75
" " " " " " " "	14.25 @	14.75
" " " " " " " "	15.75 @	16.50
White and Mottled, different grades	13.50 @	13.75
Southern Car-Wheel, standard brands....	23.00 @	24.00
Southern Car-Wheel, other brands	19.25 @	21.25
Hanging Rock, Cold Blast....	22.25 @	25.25
Hanging Rock, Warm Blast....	19.25 @	20.25

Old Rails and Wheels are very strong, and but few lots are offered for sale, speculators and brokers having largely bought up all available amounts. Prices are \$24 for Old Rails and \$21 for Old Wheels.

Cleveland.

CLEVELAND, September 17, 1888.

Iron Ore.—One of the largest dealers in the city reports the sale of 20,000 tons of No. 2 Bessemer Ore at \$5.25, f.o.b. cars Cleveland. The same grade of Ore brought \$4.75 six weeks ago. Many transactions in a smaller way are being closed and the market seems to be fully as active as the most hopeful had anticipated for this season of the year. Transportation rates have advanced to \$1.30 from Escanaba; \$1.50 from Marquette, and \$1.75 from Ashland and Two Harbors. The season's shipments to date are slightly in excess of 3,000,000 tons, with indications of the season's output reaching figures somewhere between 3,750,000 and 4,000,000 tons. Following are the present quotations, f.o.b. cars lower lake ports:

No. 1 Specular and Magnetic Bessemer Ore....	\$6.00 @	\$6.15
No. 1 Specular and Magnetic Non-Bessemer Ore....	5.25 @	5.50
Red Hematite Bessemer Ore....	5.00 @	5.25
Red Hematite Non-Bessemer Ore....	4.20 @	4.40
Menominee Range Bessemer Ore....	5.25 @	5.50
Menominee Range Non-Bessemer Ore....	4.00 @	4.25
Gogebic Range Bessemer Ore....	5.25 @	5.50

Pig Iron.—Sales of No. 1 Strong Foundry and of No. 1 Soft Silvery have occurred at an advance of 50¢ per ton above last week's quotations. It is doubtful, however, whether furnacemen are advancing prices in proportion to the steadily increasing demand which is rapidly clearing up the supply, both present and prospective. The market is very firm at the following cash quotations:

No. 1 to 6 Lake Superior Charcoal....	\$20.50 @	\$21.50
No. 1 Strong Foundry, Bessemer quality, per ton....	18.20 @	19.00
No. 1 Strong Foundry, per ton....	17.70 @	18.30
No. 2 Strong Foundry, per ton....	16.70 @	17.30
No. 1 American Scotch, per ton....	18.25 @	18.70
No. 2 American Scotch, per ton....	17.20 @	17.70
No. 1 Soft Silvery, per ton....	18.50 @	19.00

Mahoning and Shenango Valley Neutral Mill Irons, per ton....	16.00 @	16.70
Mahoning and Shenango Valley Red Short Mills, per ton....	17.00 @	17.70

Scrap Iron.—There is a fair demand for No. 1 Wrought at \$19 @ \$19.50. A few sales of Old American Rails at \$25 are reported.

Manufactured Iron.—Additional sales of Common Bar in round lots at \$1.65 are reported.

Nails.—The market is fairly active. Steel Nails bringing \$2.10 and Iron Nails \$1.95, while the demand for Steel Wire Nails at \$2.60, from store, continues heavy.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, September 17, 1888.

Pig Iron.—The condition of the market is conservative, yet strong at outside quotations. The tendency to purchase for speculative purposes has fallen off to some extent, but there is still a disposition to lay by a few 100 and 500 ton lots by parties who are known to be other than consumers. So far as can be ascertained, the sales made during the week have not fallen off in price, and all that is being turned out is being shipped as fast as made. For the past few weeks the West appears to have been the best market, so far as prices are concerned, although some large lots have found a market at Eastern ports. A movement is on foot by combined Southern and Northern capital to establish a regular line of steamers to run between Savannah and all the principal Eastern ports, for the express and nearly exclusive purpose of transporting Pig Iron and Iron Ore to these points. Should this be carried out as fully as contemplated, trains will be put on that will run exclusively for this trade, and a very large business is anticipated, which will result in materially reducing the expense of putting Iron and Ore into the hands of the consumers. We note sales of No. 2 Foundry in round lots at \$14, net, cash, at furnace bank, and in carload lots at \$14.50 @ \$15, and of No. 1 at \$16 @ \$16.50, on a basis of 60 days, at furnace bank.

Bar Iron.—All the Southern mills are running to their utmost capacity at 1.70¢ rate in carload lots. It is selling from stores at 2.50¢ @ 3¢ rates.

Detroit.

WILLIAM F. JARVIS & Co., under date of September 17, report as follows: Analyzing the Pig-Iron market, we should say that by far the most difficult Iron to obtain at ruling prices is Lake Superior Charcoal. Nearly every one reports their stock as well sold up, and advances ranging from 50¢ to \$1 per ton above ruling quotations are obtained for particular grades. Next to the scarcity of Lake Superior Charcoal can be placed Gray Forge Iron. The large demands made upon the manufacturers by the Pipe works and rolling mills have forced prices to a very strong basis. Southern Foundry Irons are easy to obtain, and, while no concessions are granted, a strong pressure brought to bear upon these higher grades may be more effective than upon the lower. While the earlier call for Ore from Lake Superior was confined chiefly to the Bessemer mines, non-Bessemer now seems to have the call, but prices are not higher net to the miners than formerly, owing to the advance in Lake freights. At the same time a larger volume of Ore is being shipped weekly now than in 1887, and it is expected that right up to the close of navigation vessel capacity will be used to its fullest extent in carrying ore. This is evidenced already by the majority of the vessels going back from Lake Erie ports light in order to save time and take advantage of the Ore

freights as they exist to-day. Altogether the market is very healthy and strong and is fairly quotable to-day as follows:

Lake Superior Charcoal, all numbers....	\$20.00 @	\$20.50
Lake Superior Coke, all ore....	19.75 @	20.25
Lake Superior Coke, cinder mixed	18.50 @	19.00
Standard Ohio Black Band....	19.75 @	20.25
Southern No. 2....	17.75 @	18.25
Southern Gray Forge....	16.25 @	16.75
Southern Silvery....	17.00 @	17.50
Jackson County (Ohio) Silvery....	18.50 @	19.00
Old Wheels....	20.50 @	21.50

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., PITTSBURGH, September 18, 1888.

Pig Iron.—The market has been less active during the past week, and, while prices are still maintained, the feeling prevails on the part of buyers that for the time at least the highest price has been reached. Consumers generally are well stocked. Some of them have covered their requirements for the remainder of the present year, and, having contracted at prices away below those now ruling, it is not strange that they are holding off, especially as there has, as yet, been no corresponding advance in the products. The furnaces are well sold up—many of them have contracts sufficient to absorb all they can make during the remainder of the present year. Therefore, while the market is not as excited as it has been, and there has been little or no change in prices for a couple of weeks, it is in a healthy condition. Thus far, furnacemen, if anything, have the best of it, for notwithstanding the improvement in price there has been but little, if any, cost added to production, while consumers, as already noted, have as yet been unable to get the price for their products up correspondingly. We quote as follows:

Neutral Gray Forge....	\$15.75 @	\$16.50	cash.
All Ore Mill....	17.00 @	17.25	"
White and Mottled....	14.75 @	15.00	"
No. 1 Foundry....	17.75 @	18.25	"
No. 2 Foundry....	17.00 @	17.50	"
No. 3 Foundry....	15.75 @	16.25	"
No. 1 Charcoal Foundry....	23.00 @	24.00	"
Cold Blast Charcoal....	25.00 @	26.00	"
Bessemer Iron....	18.00 @	18.50	"

So far as we can learn there have been no sales of Neutral Gray Forge made above \$16.50, cash, and but few at that; most of the sales during the past week were at \$16 @ \$16.25, cash. In regard to Bessemer we have failed to learn of any sales above \$18, cash, and we understand that it can still be obtained at this figure.

Muck Bar.—We continue to quote at \$29 @ \$29.25, cash, for good strong Neutral. There is not the demand there was a few weeks ago, although there is not much offering. Large buyers for the present appear to be pretty well supplied. However, there is no disposition that we can hear of to make concessions in order to effect sales.

Manufactured Iron.—There is nothing particularly new to note. Manufacturers continue to complain that the raw article is still higher relatively than the products, that as yet they have been unable to get a proportionate advance for the latter. There is a very fair business; the mills are nearly all in operation, some of them working double turn, but, as already intimated, prices are unremunerative and unsatisfactory. We continue to quote upon a basis of 1.80¢ @ 1.85¢ for Bars, 60 days, 2% off for cash. Mills making a specialty of Skelp Iron are quite busy, and this kind of Iron has been advanced from one to two tenths as compared with the lowest point.

Nails.—The Nail trade does not show much improvement in demand, but prices are better. Makers are now able to realize full card rates, and it is evident that there has been an advance. It could not well be otherwise, in view of the fact that Nail Plate has advanced from \$1 to \$1.50 per ton and makers could not afford to pay

the advance for Plate and sell Nails below the card. We continue to quote 12d to 40d at \$1.90, 60 days, 2% off for cash.

Wrought-Iron Pipe.—There is a continued good demand, especially for small sizes, and the mills generally are fully employed, some of them working up to their full capacity. Prices have been advanced during the past week. There was no meeting of manufacturers, but the advance was made by telegraph, a mutual agreement having been made by all the mills to adhere to prices quoted. Discounts on Black Butt-Welded Pipe, 55%; on Galvanized do., 50%; on Black Lap-Welded, 65%; on Galvanized do., 55%; $\frac{1}{2}$ casing, 40¢ per foot net; 2-inch Tubing, 13¢; Boiler Tubes, 65% off, large lots.

Old Rails.—There has been but little change in the market during the past week; demand appears to have fallen off somewhat, but offerings continue light. American tees may be quoted at \$25, at which figure a sale of 1000 tons was reported. Foreign Tees cannot be laid down in Pittsburgh at the price quoted for American, and while this is the case it is not likely that there will be any sale made of the former in this market.

Steel Rails.—No new business reported here, and prices are nominally unchanged. The new Rail mill of the Duquesne Company will, it is expected, be ready for business about the 1st of January next.

Billets, &c.—Bessemer Steel Billets are still quoted at \$29, cash, delivered on cars at maker's works; some makers quote 50¢ @ \$1 higher, but very few, if any, sales have been made above price quoted. Nail Slabs also quoted at \$29. Sales of Domestic Crop Ends at \$19.

Railway Track Supplies.—Prices remain as last quoted: Spikes, 2¢, 30 days, delivered; Splice Bars, 1.80¢ @ 1.85¢; Track Bolts, 2.85¢ with square, and 2.95¢ with Hexagon Nuts.

Old Material.—There is a continued steady demand, and prices are steady as quoted: No. 1 Wrought Scrap, \$21, net ton; Car Axles, \$26, net ton; Wrought Turnings, \$13.50 @ \$14; Cast Scrap, \$15.50 @ \$16, gross; Old Car-Wheels, \$20; Cast Borings, \$12.50 @ \$13, gross.

New York.

Office of *The Iron Age*, 66 and 68 Duane street, New York, September 19, 1888.

American Pig.—The Pig Iron market has not materially altered during the week under review. The opinion is held by some that prices will likely advance but no immediate change is anticipated. In the meantime current quotations are firmly adhered to and there is no disposition shown to shade prices. The volume of trade for the week has been light, most of the dealers reporting only small sales, and, in fact, the sum total of the business thus far this fall has not been of any large proportions. Advices from the West bring very encouraging accounts but though they tend to promote a hopeful feeling in this section there is no actual improvement to note here. A good deal of Iron is being delivered at present on old contracts, but few new orders are being placed. The product of the Southern furnaces is pretty well sold for delivery both East and West and consequently there is little doing in this department. The supplies of Foundry Pig are not large and any considerable increase in demand would bring about scarcity. Prices are as last quoted. The Thomas Iron Co., who report sales of a few thousand tons during the week, continue dry, quote \$18 as the price for No. 1 Foundry other sellers, however, are asking \$18.50, and for choice quality \$19 is obtained. No. 2 Foundry we continue to quote at \$17 @ \$17.50 and Gray Forge \$15.75 @ \$16.25.

Scotch Pig.—The strength exhibited by the foreign market and the rise in the ocean freight rates have stiffened prices here, and as a result but little business is being done. The current imports are of ordinary volume, but stocks here are said to be light. While it is true that a strong feeling pervades the market, there is little actual change to report. Importers are quoting Coltness from \$21 to \$22; Shotts, \$20 @ \$20.50; Langloan, \$20.50, and Dalmellington, \$19.75.

Structural Iron.—The quotations in this department are the same as a week ago. The mills are pretty well employed, and prices, though unchanged, are firm. We quote for round lots, on dock: Sheared Plates, 2¢ @ 2.10¢; Universal Mill Plates, 2.1¢ @ 2.15¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.7¢ and Channels and Beams, 3.3¢.

Plates.—There is nothing new to report concerning this market. Trade is moderately active, and prices are firmly held. We quote for round lots, on dock: Iron Tank, 2¢ @ 2.10¢; Shell, 2.25¢ @ 2.4¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.65¢ @ 3¢, and Fire-Box, 3.5¢ @ 4¢.

Steel Rails.—No definite news has been received from England concerning the revival of the International Rail Association. A cable dispatch to one of the daily papers, a few days ago, stated that no agreement had been made, the representatives of the German Rail mills who went to London failing to reach any definite result, but that they would return and resume negotiations next week. On the other hand, it is rumored that the combination had been effected, but, whether or no the rumor is true, it is generally believed that a definite agreement will be reached, and that the present delay is only due to the discussion of details. In the market here there is nothing new to notice. The trade is quiet, and we do not hear of any large contracts being placed. Prices are moderately firm, but the rise in Bessemer Pig has not led to any advance in Rails. We continue to quote \$28.50 @ \$29 at Eastern mill, though we are told that some small orders have been placed at lower figures. A good many Steel Rails have been sold for delivery next year, aggregating in all something like 200,000 tons.

Old Rails.—The market is very firm and holders are advancing prices. The views of buyers and sellers are, however, so wide apart that actual business is restricted. The lot of 1000 tons of Tees, referred to in our last issue as being offered by the New Haven Railroad, was sold, but the price is not known, though it is rumored that they went at \$24. It should be borne in mind, however, that the Rails were to be delivered in New Haven or Bridgeport. The only other important transactions we hear of are 5000 to 7000 tons of Tees by the Boston and Maine Railroad, at \$25, for consumption in Massachusetts, and a lot of 2200 tons of Double Heads, 1600 tons of which brought \$24.25 and the remainder \$24.87 $\frac{1}{2}$, ex-store, New York. A few small lots of Double Heads are also reported sold at \$24.50. There are orders for many thousand tons of Old Rails in the market, but buyers are not disposed to place them at current quotations. But few Rails are being imported and stocks are light, the whole amount in store here being variously estimated at from 7000 to 10,000 tons, all of which are in the hands of a limited number of holders. We quote Tees \$25 and Double Heads \$26 as sellers' asking price.

Fastenings.—With the advance of the Old-Rail market Fastenings are showing considerable strength, but there are no

noticeable changes in price. The market is quoted as follows: Spikes, \$2.15 @ \$2.20, and Angles, 2.05¢.

Scrap.—There is a very active demand for Scrap, but, as many of the yards are bare of stocks, consumers are experiencing more or less difficulty in obtaining supplies. No. 1 Wrought-Iron Scrap may be quoted at \$20 out of yard, and Selected Scrap is bringing \$21.

Wire Rods.—The consumptive demand for foreign Wire Rods continues light, and, compared with previous years, the importations are of small volume. Stocks here are scarce. We continue to quote the market at \$39.50 @ \$39, but for early shipment \$40 is the ruling figure.

Financial.

The severe rain storms of the past week have interrupted freight transportation, and disastrous floods in South Carolina, Georgia and other agricultural sections have caused heavy losses on rice and cotton plantations. Bad crop reports from the Northwest caused much excitement on the Produce Exchange on Monday, and despite recent accounts respecting the favorable progress of the harvest wheat and corn both advanced, serving to offset the decline of about 2¢ $\frac{3}{4}$ bushel since our last report. The Washington weather crop bulletin states that the reports from the corn belt indicate that the weather during the past week was very favorable, and that the corn crop, which is very large, is generally secure and past injury from frost. The frost which occurred during the week along the northern border of Iowa, and in Minnesota, Wisconsin and Michigan, did some damage to crops which were yet immature. Taking all in all the general business situation is good, with the drawbacks noted. Wholesale grocers in this city report that the order trade from the South is at least as good as usual at this time of year, notwithstanding the Florida epidemic. Railways are burdened with freight, especially in the Lake regions, where ore, grain, &c., are being pushed forward with dispatch. On the Canada side there is some preparation in anticipation of the enforcement of retaliatory measures, the idea being to make winter shipments of cargoes via Halifax and St. John's. At Pittsburgh receipts from the lakes are remarkably large, and there is an increased movement of ore, coke and iron. The shut-down in oil will be discontinued November 1. Quite a fleet of English "tramp" steamers now due have been chartered to load cotton at New Orleans at 55¢. Railroad earnings for August are increased 2 $\frac{1}{2}$ % nearly, as compared with last year. The disturbance in trunk-line tariffs continues.

The Stock Exchange markets were much agitated by the unexpected passing of the semi-annual dividend on St. Paul common stock and reducing the rate on preferred from 7% to 5%. London selling became general and other stocks were seriously affected. The decline was accelerated by the advance of the Bank of England rate of discount, and an advance from 2 $\frac{1}{4}$ % to 3 $\frac{1}{4}$ % by the Bank of France. On Friday following the market continued unsettled and weak, and in the course of three days the average price of 60 stocks declined more than it had advanced during the previous fortnight. Fluctuations were wide and active. Outside of the Grangers, Missouri Pacific was the chief feature. The weakness was owing to the published report from Denver, afterward denied, that the road is to increase its capital stock by \$6,000,000. On Monday the market closed strong. On Tuesday the market opened at a decided advance for St. Paul and the other grangers, and the market was generally strong. On

Wednesday the improvement continued, with Lake Shore at 99½, the highest in two years.

United States bonds are quoted as follows:

U. S. 4½s, 1891, registered	106½
U. S. 4½s, 1891, coupon	106½
U. S. 4s, 1897, registered	124¾
U. S. 4s, 1897, coupon	124¾
U. S. currency 6s	121

The bank clearings of 38 cities last week show an increase of 3.1 % compared with last year. Outside of New York the increase is 4.8 %. New York gained 8.9; Boston, 1.5; Philadelphia, 11.2; Chicago, 7.7; St. Louis, 14.9; Kansas City, 14.7; Louisville, 9.9; Milwaukee, 7.8; Omaha, 17.3; Denver, 10.5; Peoria, 21.5, and Topeka, 36.9 %. Cincinnati lost 5.8; St. Paul, 2.2; Minneapolis, 6.9; Galveston, 13.6; Memphis, 23.2; Duluth, 7.2, and Norfolk, 11.8 %.

The weekly bank statement showed a gain of about \$500,000 in surplus reserve, which is now \$12,423,875 in excess of legal requirements, as compared with \$3,810,675 a year ago, and \$7,682,125 in 1886. The changes in the averages are unusually slight, owing to the fact that the drain of currency to the West and South has been partly counterbalanced by the release of money by the Treasury on account of recent purchases of bonds. As the purchase of bonds on Thursday and Friday was not comprised in the statement, the banks on Saturday night were fully \$4,000,000 stronger than represented. The exports of specie from this port during the week were \$245,000, and the imports \$410,000. Since January 1 the amounts, respectively, are \$27,690,000 and \$6,440,000.

The money market is gradually hardening, as appears in a perceptible advance in time money as well as discounts. The movement of currency into the interior was heavier than before since the fall demand began to be felt. The rates for time loans were 4 @ 4½ % for four months or less, and 5 % for four to six months on good collateral. Commercial paper was in very full supply, but the demand was light. Rates were quoted 5½ @ 7½ %, according to the grade of paper and the time to run. Confidence was expressed that the policy of the Treasurer in buying bonds, if reasonable prices are named, is adequate to prevent undue stringency. The advance of the minimum rate of discount of the Bank of England to 4 % still further strengthened sight and cable bills. The leading drawers of sterling put up the sight rates to \$4.89 and \$4.89½, so that quotations were near the gold exporting point, but no outward movement of precious metals is looked for in prospect of liberal exports of cotton and breadstuffs. For the present the high rates of ocean freight operate to restrict shipments within narrow limits.

The preliminary statement by the Bureau of Statistics of the exports of the United States in August shows a decrease of \$8,175,983, or 22 per cent., as compared with last year, the falling off having been principally in cotton and breadstuffs, the exports of these two articles having been \$8,066,816 smaller than in 1887. Dairy products and hogs show a falling off, but the other items show gains over last year. The following is a comparison of the August exports with those of last year:

	1888.	1887.
Cotton.....	\$2,853,327	\$4,562,886
Breadstuffs	12,023,687	18,380,444
Provisions.....	6,272,184	6,104,306
Cattle	1,436,113	1,290,104
Hogs	400	16,490
Mineral oils.....	4,676,333	4,384,374
Dairy products	1,620,587	2,370,927
Total.....	\$28,879,631	\$37,055,614

The *Chronicle* gives a statement of the cotton crop of the United States for the year ending September 1, 1888. It shows that the total crop reaches 7,017,707 bales,

while the exports are 4,638,981 bales, and the spinners' takings are 2,230,294 bales, leaving stock on hand at close of year 181,285 bales. Crop for year 1886-7 showed 6,513,623 bales; 1885-6, 6,550,215 bales.

The imports of merchandise at this port during the week were large, amounting to \$10,185,000, of which \$2,369,000 represent dry goods. Since January 1, the total is \$335,374,000, as compared with \$335,348,000 for the same time last year and \$11,360,000 in 1886. Exports for the week were \$5,371,680: total since January 1, \$205,166,000, against \$219,398,000 for same time last year.

Coal Market.

The Anthracite Coal trade remains comparatively quiet as respects new orders, but heavy deliveries are in progress under contracts made prior to the last advance, and the activity at the mines is extraordinary. The Wyoming region alone produced upward of 500,000 tons, and the aggregate from the three great mining fields is no less than 935,523 tons, an output for a single week rarely, if ever, surpassed. Compared with the previous week, the increase is 54,000 tons. Since January 1 the aggregate is 25,821,030 tons, an increase of nearly 2,000,000 tons over the same time in 1887. The output for five weeks compares as follows:

Week ended August 18.....	920,922
Week ended August 25.....	832,058
Week ended September 1.....	844,665
Week ended September 8.....	881,802
Week ended September 15.....	935,523

It does not yet appear that any considerable amount of business has been done at the advanced prices, but prices are understood to be firm, except for Broken and the smallest steam sizes, which accumulate. For Pea Coal it is said that buyers can make their own terms. Quotations are as follows:

	Broken.	Egg.	Stove.	Cnut.
Hard white ash.....	\$4.15	\$4.40	\$4.65	\$4.55
Free white ash.....	3.95	4.30	4.05	4.55

Fancy grades range about 4.50¢ @ 4.90¢. The movement of Coal Eastward has been expedited, to take advantage of current rates by small sailing vessels, but the Western demand has fallen off. The chances of lower prices for Coal in October or November, at the furthest, are the subject of discussion. Individual operators feel strongly respecting the alleged preference shown to corporations in supplying cars. At Wilkesbarre several large operators charge the railroads with carrying Bituminous Coal for a less rate than Anthracite, and have engaged legal counsel to appear before the Interstate Commerce Commissioners.

The Bituminous Coal trade is fairly active, with some cutting on the lower grades. The supply as well as the consumption steadily augments in volume. The Philadelphia *Ledger* says: "The extension of the new lines constructed chiefly to feed the Pennsylvania Railroad within the past couple of years has resulted in increasing the tonnage brought to it from the Cumberland region this year 318,000 tons, and from the Broad Top mines 14,773 tons. The Bituminous output from all the other regions has also largely increased. The Clearfield tonnage has increased 32,197 tons. The Pocahontas Flat Top region, which was opened about 1883, has grown to be an important factor in the Soft Coal trade, and already this season 1,070,384 tons have been brought from the mines in that district, an increase of about 300,000 tons. The Beech Creek, the youngest and "most obstreperous" Bituminous Coal road, in which the Vanderbilts are believed to have an interest, has carried to market thus far in 1888 1,161,000 tons, or about 840,000 tons more than it

did last year to the same date." The Pennsylvania Road last week transported 217,000 tons of Coal, and during the year 7,976,000 tons, an increase of nearly 900,000 tons compared with 1887. Reading last week shipped 205,000 tons of Coal, of which 43,000 tons were delivered at Port Richmond and 13,000 at Elizabethport.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from September 7 to September 15, inclusive, and from January 1 to September 15, inclusive, were as follows:

Iron and Steel.

	Sept. 7 to Sept. 15.	Jan. 1 to Sept. 15.

Metal Market.

Copper.—Since our last week's report spot Chili Bars suddenly dropped in the London market from £95 to £91, but subsequently recovered to £101 and declined to £96 yesterday and to £95 to-day. Futures meanwhile remained unaltered, £79; good, merchantable brands improved from £76 to £76.10. The visible supply in England and France is cabled at 75,474 tons on September 15, against 84,110 on on September 1, but in reality there is improvement as the difference is merely a shipping of stock from France to get money loaned on it somewhere. This temporarily reduces the stock of Chili Bars there, and while this Copper is in transit it looks as though it must have gone into consumption. Such kind of dodges can do the main holders no good, because they deceive nobody who watches things closely over there. Here the market has been pretty much stagnant; at 16½¢ spot the syndicate sells consumers; to speculators at 17½¢; 17.20¢ is the quotation for Sept., and 17.05¢

@ 17.10¢ for the later months. The new Calumet and Hecla vertical shaft is called the Whiting shaft; rock has commenced to be hoisted from No. 3 Calumet shaft. Another vertical shaft to be sunk immediately is to bear the name of the Calumet and Hecla and West shaft; it will be back of No. 4 Calumet; the output in August was 3088 tons; September is expected to produce 500 tons more than August. Rio Tinto rose 1½ francs at Paris last week. The closing spot quotation is 17½¢ @ 17½¢.

Tin.—London since Wednesday last week gave way with spot Tin from £103.10/ to £99, and with futures from £104 to £99.10/, but since then there was a return to the previous high ruling, spot coming £103.15/ yesterday and £103.10/ to-day, while futures were £104.5/ yesterday and came £104 to-day. In a jobbing way Tin is worth here 23½¢ spot, and 23½¢ 30 days, with a very moderate trade, whereas the speculative quotations are 22.55¢ September and 22½¢ October, 23½¢ being offered on the spot and 23½¢ asked. Although it is conceded that the statistical position is improving the continual wide fluctuations in London unsettle everything, and the price is now high enough to recommend extreme caution. **Tin Plates.**—There has been a fair demand for them; in fact, all the stock on hand can meet. Certain sizes are exceptionally, nay, abnormally, high; thus, IC and IX 14 x 20 Charcoal advanced about 50¢ per box, and will, of course, recede the moment supplies come in; 14 x 20 Cokes also continue scarce, and command \$4.65. The advance noted last week in futures still holds good. We quote at the close, large lines, per box, on the spot: Siemens-Martin Steel, Charcoal finish, \$5.25 @ \$5.75; Coke finish, \$4.75; Terns, \$4.30 @ \$4.40; Bessemer Cokes, \$4.65, and Wasters, \$4.30. Cokes remain 14/ in Liverpool.

Lead.—Hardly anything has transpired in the way of sales outside of the exchange, only carloads changing hands at 4.95¢ @ 5¢. The bull clique of speculators now hold 20,000 tons, having again bought some 2000 tons on change at 4.95¢ and 4.97½¢ September and October. Latterly, it is thought, the speculative holders have evinced some weakness. In St. Louis and Chicago the price is 4.70¢ October. A leading Cologne (Prussia) paper asserts, under date September 3, that the obstacles that stood in the way of getting the Spanish Lead mines to join the convention have been happily removed; as this is, however, not confirmed from other important sources thus far, it will be safer to await further developments. Soft Spanish rose in London from £13 15/ to £14. On change 32,500 lb October Lead fetched 4.97½¢.

Spelter.—The market in New York has been dull, because there is no stock, but in Pittsburgh 5½¢ has been paid for Common Domestic, which would be equal to 5½¢ here. It is expected that the next sale effected in this city will be at 5½¢. Blende is now paid \$30 per ton at the West. Silesian also improved still further in London to £18.15/, which would be equal to 5.85¢ laid down in New York, the nominal quotation for good brands at New York is 5.85¢ @ 5.87½¢.

Antimony.—Has been quiet but steady at 10¢ Hallett and 12½ @ 13¢ Cookson.

New York Metal Exchange.

The following sales are reported:

THURSDAY, September 13.

164 tons Lead, September.	4.97½¢
144 tons Lead, September.	4.95 ¢
48 tons Lead, September.	4.92½¢
16 tons Lead, October.	4.95 ¢
16 tons Lead, spot.	4.96 ¢
40 tons Tin, spot.	22.75 ¢
50 tons Tin, October.	22.30 ¢
10 tons Tin, October.	22.30 ¢

FRIDAY, September 14.	
116 tons Lead, October.	4.97½¢
128 tons Lead, October.	4.95 ¢
SATURDAY, September 15.	
100 tons Lead, October.	4.97½¢
48 tons Lead, October.	4.95 ¢
MONDAY, September 17.	
1156 tons Lead, October.	4.95 ¢
164 tons Lead, October.	4.97½¢
16 tons Lead, October.	4.92½¢
16 tons Spelter, October.	4.95 ¢
TUESDAY, September 18.	
48 tons Lead, October.	4.97½¢
WEDNESDAY, September 19.	
16 tons Lead, October.	4.97½¢
100 tons Lead, October.	4.95 ¢

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]
LONDON, WEDNESDAY, Sept. 19, 1888.

The course of the market during the past week and the plan of action followed by the parties who have been most conspicuous in the trading strengthen the previous belief that block Tin is virtually controlled by French operators. Just who the principals are is a matter of conjecture, so cleverly are their tracks covered; but the impression obtains that operators interested in Copper take more than passing interest in the Tin speculation. The irregular movement of prices, with sharp advances immediately after evidences of "short" selling, strengthen that belief in no small degree, and speculators and consumers alike seem to consider that a further rise is more than probable.

Chili Bar prompts have reacted sharply, owing in a great measure to settlements having been made privately by operators who had deliveries to make on contracts expiring this month. The highest price paid was £106. From that point a reaction to £90 took place, followed subsequently by a rise of £3, futures meanwhile remaining almost stationary. It is stated that the squeeze was carried through for the purpose of effectually putting a check upon outside "bear" operations, and also that, while the latter have lost heavily, the purchases necessary to force prices up have cut the net profit on the movement down to a comparatively small sum. It is estimated that the "short" interest on which deliveries fell due this month aggregated 10,000 tons, a great portion of which was covered early in the month. It is also calculated that the deliveries due on contracts expiring next month involve the greater portion of 15,000 tons. The French operators have figured to no remarkable extent in the trading the past week, and it is believed that it is their object to force private settlements of the "short" sales on which deliveries are due next month.

The statement comes from a presumably well informed source that the Société des Métaux is well satisfied with the financial results of their operations between producers and consumers, and that existing contracts will be renewed for a further period of three years, providing the mining companies are agreeable.

Copper furnace material continues very firm, but the transactions that can be traced out suggest very cautious buying by consumers. Among sales the past fortnight, Messrs. James Lewis & Sons' circular notes 200 tons Anaconda Matte at 15/ per unit, at Liverpool.

Tin Plates have been more active this week than last. The market is unmistak-

ably strong, but prices are somewhat irregular, both makers and buyers being influenced to greater or less extent by the course of the market for Block Tin.

The Treforest Works management are doubling their output and erecting a new mill. They now have seven mills in active operation.

The iron "warrant" market has received no small degree of support from outside speculative buying orders, the latter being encouraged by reports of continued active home demand and more or less extensive orders from America. Makers' brands of Scotch are again higher, as are also Middlesboro' and Bessemer products, the demand for which continues active.

In Manufactured Iron there continues to be a brisk business at firm prices, and most of the Steel branches are showing increased activity. Prices are higher on Rails, Blooms, Billets and Slabs, but unchanged on Wire Rods. Spiegeleisen is firmer and more active.

The failure is announced of Bennet Brothers, Liverpool, with liabilities of £25,000.

Scotch Pig.—The market has continued active and strong, with prices 6d to 2/ higher.

No. 1 Coltness, f.o.b. Glasgow	51/
No. 1 Summerlee, " "	53/
No. 1 Gartsherrie, " "	48/
No. 1 Langloan, " "	50/
No. 1 Carnbroe, " "	44/
No. 1 Shotts, " at Leith	49/
No. 1 Glengarnock, " Ardrossan	47/
No. 1 Dalmellington, " "	43/6
No. 1 Eglinton, " "	42/6
Steamer freights, Glasgow to New York, 10/	
Liverpool to New York, 10/	

Cleveland Pig.—There is still a brisk trade and the market retains a strong tone. No. 1 Middlesboro', G.M.B., 37/6; No. 3 do., 35/3.

Bessemer Pig.—Business has been on a large scale and prices are again higher. West Coast brands, mixed numbers, 46/ f.o.b. shipping point.

Spiegeleisen.—Demand is more active, and the market firmer. English 20 % quoted 77/6, f.o.b. N. W. England shipping point.

Steel Rails.—There is a brisk demand, and prices are higher at all points. Standard sections quoted at £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—In these there is a fairly active business, with prices firm and higher. We quote £4 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—Transactions have been on a large scale, and the market is strong. Bessemer, 2½ x 2½ inch, £4. 1/3, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—The market remains quiet and unchanged. Mild Steel No. 6 quoted at £5. 18/9 and No. 5 at £5. 17/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—Only a moderate trade, but prices very firm. Bessemer, £4, f.o.b. at N. W. England shipping point.

Old Rails.—Not much demand, but holders very firm. Tees quoted at £2. 17/6, and Double Heads £3, f.o.b.

Scrap Iron.—There is a moderate business at steady prices. Heavy Wrought quoted at £2. 7/6 @ £2. 10/, f.o.b.

Crop Ends.—Demand moderate, and prices unchanged. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—Business is of liberal volume, and the market strong. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3 @ 15/9
IC Bessemer steel, Coke finish	13/9 @ 14/
IC Siemens " "	14/ @ 14/3
IC Coke, B. V. grade	13/6 @ 13/9
Charcoal Terne, Dean grade	13/ @ 13/6

Manufactured Iron.—There is an active trade all through and prices are strong. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d.	£ s. d.
Common	@ 7 12 6	@ 5 0 0
Bl'k Sheet, singles	@ 7 0 0	@ 7 0 0
Velsh Bars (f.o.b. Wales)	@ 4 17 6	

Tin.—The market rather quieter. Straits quoted at £103. 10/, spot, and £104 for three months' futures.

Copper.—Spot market very irregular, futures steady. Chili Bars, £90. 5/, spot, and £78. 10/ three months' futures. Best Selected, £79.

Lead.—Market very slow and rather weak. Soft Spanish, £13. 15/.

Spelter.—There is still a good demand, and prices are firm. Silesian, ordinary, £18. 15/.

The decline of steamboating on the Upper Mississippi River, the Missouri and their tributaries is so rapid that navigation within a few years will be wholly abandoned in the Mississippi above its confluence with the Ohio, save by barges and the lumbering traffic. Within about 20 years the wharves at St. Louis were jammed with steamers doing a prosperous trade, whereas to-day scarcely half a dozen in actual business can be seen along the entire river front. The low rates for merchandise and the fast time made by railroads have destroyed all competition. Among the southbound boats the Tennessee River trade has suffered in the general decline. Even the barge line to New Orleans, which brought to the interior heavy importations of foreign goods, has not half the traffic that it enjoyed a year ago, and warehouses on the river are being converted to other uses.

The new shops for the Canadian Pacific Railway, now being built at Montreal, include a passenger car shop, 400 feet in diameter and two stories high; a wood machinery shop, 400 x 100 feet, also two stories high; a blacksmiths' and machine shop, 300 x 100 feet; a storeroom, 350 x 90 feet, two stories high, and a foundry, 150 x 100 feet. The buildings are of brick and stone and estimated to cost \$300,000.

A large electric light and power installation is about to be erected at Toulouse. The requisite power will in the first place be derived from water motors, the site of which is in the center of the town. The fall available will furnish 2000 horsepower.

Tacoma, the future city of the Puget Sound country, is remarkable for its steady growth. The permanent character of its buildings and improvements of all kinds impresses a stranger with an idea of its great future. With one of the finest harbors on the entire coast, the cheapness and celerity with which cargoes are handled make it of great attraction to foreigners. The largest vessel may lie along the docks, and discharge its cargo at a minimum cost. The lumber interest of Puget Sound is growing rapidly. Vessels are constantly loading at its docks for South America, China, Australia and California. As the waters are always still no difficulty is experienced in transporting logs in rafts to any point that may be desired. In one day at Tacoma 14 ocean sailing vessels and 23 steamers were registered. The

Northern Pacific has opened up a vast area of country, and it is promoting the interest and welfare of the people along the line across the continent. Vancouver, the terminus of the Northern Pacific Railroad, is actively competing for the tea trade with Japan. The Canadian Pacific steamer Parthia, from Vancouver August 1, made the shortest outward run on record between the Pacific coast and Japan, being but a few hours over 13 days. The silk and tea ex-Abyssinia, from Yokohama, at Vancouver, were delivered at New York in 10 and 14 days respectively. The Aberdeen, at Vancouver, 15 days from Yokohama, delivered its silk in New York in 9 days, and teas in 13 days from the Pacific coast.

Artificial Irrigation.

Artificial irrigation is recovering for agricultural purposes a large expanse of arid territory in Arizona and New Mexico heretofore regarded as worthless, and capital in large amounts is finding profitable investment in irrigation enterprises. The valleys of the Salt and the Gila Rivers have at least 2,000,000 acres of land that can be readily irrigated, and with the adoption of new systems of distribution and of storing and economizing water it is probable that that area can be at least doubled. The methods at present in vogue are wasteful, for the supply is so abundant that there is little need of economizing it. The work of developing the supply is going on rapidly, but nowhere near the extent, it is evident, to which it will soon be taken in hand. At present there are in the valley of the Solado something like eight main canals, having an aggregate length of 160 miles, and built at a cost of something like \$1,000,000. These have a capacity of irrigating something like 200,000 acres under the present system, but their irrigating capability could be much increased by the exercise of due economy. The Arizona canal is the chief of these enterprises. It has a length of 41 miles, and 120,000 acres of land will be ultimately tributary to it when all is brought under cultivation. In most of these canals the ownership is in what is called "water-rights." The canal is built by a company, each member of which has so many rights, according to the amount of his investment. A water-right entitles the possessor to the use of a given quantity of water from the canal. In most cases it is the constant use of 100 inches, which is considered sufficient to irrigate a quarter-section or 160 acres. Instances are mentioned where a single company have received as much as \$1,000,000 from the sale of water-rights, besides an income from the tolls. Both Arizona and New Mexico are exceptionally favored in having a large proportion of their area composed of a conjunction of mountain groups with broad plain-like valleys. It is believed that enough of these valleys will be found to be irrigable by damming up the beds of torrents at the feet of the mountains to make both Arizona and New Mexico two of the richest agricultural States in the Union.

A valuable relic of the Kearsage is preserved at the Mare Island Navy Yard—namely, the figure-head of the famous vessel erected on a handsome pedestal. An inclosure has been formed with dismounted cannon and chains, and on this is a flagstaff, from which floats the stars and stripes. The *American Army and Navy Journal* says this is guarded by mounted fieldpieces and close beside it stands the figure-head.

It is reported from Paris that the French Government will probably remove the import duty from cereals, on account of inadequate harvests.

Hardware.

Trade continues in a satisfactory condition, with a steady demand embracing general assortments of miscellaneous Hardware, with a good share of seasonable goods. Prices generally are without important change, the tone of the market continuing moderately firm, a few lines showing a tendency to stiffen, while others are without change, or, in a few instances, slightly weaker. Manufacturers are generally well supplied with orders, and, in some instances, are on this account less desirous of selling goods and are withdrawing some of their extreme quotations.

Cut Nails.

A very fair volume of trade is being done and most of the Eastern mills are running full. Stocks are comparatively light. Though there has been no quotable advance in the price of Nails the general improvement in the Iron trade has a favorable influence and tends to keep current quotations firm. We continue to quote \$1.85 to \$1.90 for carload lots on dock. We are advised by telegraph that a special meeting of the Western Cut Nail manufacturers was held at Pittsburgh Tuesday the 18th inst., with a fair attendance, 18 firms being represented. A pooling plan was submitted, but no action was taken on it. The \$2 card was reaffirmed. It was reported that the demand for Nails had slightly improved.

Wire Nails.

Manufacturers are reported to be adhering to the new prices, thus giving the market a firm tone. Some Nails purchased prior to the advance are, however, offered by holders at a slight concession.

Barb Wire.

In pursuance of a call issued by the Executive Committee, appointed at a previous meeting, a meeting of the manufacturers of Barb Wire was held in the Tremont House, Chicago, on Wednesday, the 12th inst., at 2 p. m. Upward of 20 were present, representing some 120,000 tons of the 150,000 tons estimated annual production. The meeting was one of the most harmonious in the history of the organization. Full reports were given by Mr. Washburn, of the Washburn & Moen Mfg. Company, as to the present status of the litigation against the manufacturers of unlicensed Barb Wire. It was freely conceded that the prices at which Barb Wire is now being sold are very unremunerative. The discussion which followed resulted in the unanimous adoption of a plan which, it is confidently anticipated, will result, when carried out, in placing the business on a very satisfactory basis. It was expected that another meeting would be called within 10 days, during which interval it would be possible to hear from every manufacturer in the country, and if the co-operation of all who were not present at this meeting was obtained, the result aimed at would be accomplished. H. B. Cragin, of the Washburn & Moen Mfg. Company, was chairman of the meeting, and G. W. Henry, of Joliet, was secretary.

There is little change in the condition of the market in this city, the price of 4 cents for carload lots being almost entirely nominal and shaded freely. The demand, however, is quite limited, though the outlook for the trade of the coming season is regarded as satisfactory.

Miscellaneous Prices.

There is a reaction from the extremely demoralized prices which have prevailed in Wrought-Iron Pipe. For different rea-

sons some of the mills have withdrawn from the market and a more conservative disposition prevails among those who are still in the field. As a result prices are somewhat firmer than heretofore, and there is a pretty general agreement on advanced prices, such as the following:

	Discount per cent.
1 1/4-inch and smaller Black Pipe.....	55
1 1/2-inch and larger Black Pipe.....	65
1 1/4-inch and smaller Galvanized Pipe.....	47 1/2
1 1/2-inch and larger Galvanized Pipe.....	55
1 1/4-inch and smaller Tarred Pipe.....	55
1 1/2-inch and larger Tarred Pipe.....	65
Well Casing, all sizes.....	60
Lap-Welded Charcoal Iron Tubes.....	65
Lap-Welded Steel Boiler Tubes.....	60

When the Screw manufacturers agreed in 1886 to discontinue their ruthless slaughtering of prices, and adopted measures calculated to secure greater steadiness in the trade, one of the most prominent and experienced of their number predicted that it would be two years before the real influence of their action would be felt. He reasoned from his knowledge of stocks in the hands of jobbers and from his understanding as to contracts for Screws which were yet to be filled. His prediction was borne out by the fact that for a long time prices continued weak, notwithstanding the undoubted good faith which the manufacturers kept with one another. Their discount to jobbers was 70, 10 and 5, but the jobbers were able to beat this price in numerous transactions, and to capture trade which should, from its magnitude, have gone to the manufacturers. One large transaction is known to have been made in the West in the past year at 80 and 2 1/2, by a jobber, notwithstanding the steady maintenance of manufacturers' prices at 70, 10 and 5. The verification of the prediction now seems to have occurred. Since July the price of Screws has been hardening, and manufacturers have at last secured control of the market. Jobbers who once were able to secure an extra 10 or an extra 5 without difficulty find themselves confronted with the necessity of paying the regular price for such stock as they need. They ask for 5 per cent., and even express a willingness to take 2 1/2 per cent. if they can get no more, but as far as can be learned the manufacturers are generally firm in their fixed rates. The bareness of stock in second hands is shown by the increased inquiries now being received by manufacturers and by the larger sales which they are now making. The opinion is freely expressed that manufacturers could easily put up their prices to 65 per cent. discount if they felt so disposed, as their organization is understood to be a strong one. But in view of the impression which prevails in the trade, that the goods are already very high, and the dissatisfaction with which an advance would be received, the companies have simply maintained their old prices.

The market for Steel and Wire Goods remains as at our last report—in excellent condition—and with a good prospect for the coming season. The understanding reached by the manufacturers seems to be working satisfactorily, and, as far as present indications go, the prospect for its continuance during the coming year is good. It is to be noted, while there has been no change in the discounts on Steel Goods, that in view of the recent advance in the price of Steel the ruling prices on these goods are lower, comparatively, than last year. The discount on the goods is, in fact, the same as it was when stock cost nearly 20 per cent. less than at present, and, on this account, it would not surprise the trade if an advance in price were made.

Jersey City Smelting Works, Jersey City, N. J., in view of the advances in Metals, announce, under date September 12, the following advanced prices for their standard grades of Babbitt Metals. The

terms are, on orders of 500 pounds or over, 60 days' acceptance, or 1 1/2 per cent. discount for cash in ten days; less than that amount, 30 days, net, f.o.b. Jersey City or New York City:

	Per pound.
Star.....	5 1/2 cents.
No. 4.....	9 1/2 cents.
No. 2A.....	13 1/2 cents.
A.....	21 1/2 cents.
Diamond.....	23 1/2 cents.
Star and Crescent.....	8 cents.
No. 3.....	11 1/2 cents.
No. 1A.....	16 1/2 cents.
Genuine.....	21 1/2 cents.
Extra No. 1.....	24 cents.

The Penn Hardware Company, Reading, Pa., are making the Penn Apple Parer, Corer and Slicer, and the Perfection Apple Parer, Corer and Slicer, on which they quote to the general trade \$4 per dozen.

E. C. Meacham Arms Company, St. Louis, Mo., have recently issued a postal, in which they offer special low prices on some lines of Ammunition unsaleable in that market, and make also quotations on other goods.

The Nubian Iron Enamel Company, Chicago, Ill., issue a small pamphlet devoted to a description of their Iron Enamel, giving a number of testimonials in regard to its merits, among which we observe letters from a number of well-known Hardware houses. Their quotations are as follows:

Bonnell's Nubian Iron Enamel, per dozen.....	\$2.00
Bonnell's Liquid Stove Polish, per gross.....	8.00
Bonnell's Benzine Stove Polish, per gross.....	6.00
Bonnell's Benzine Stove Paste Polish, in 5-pound pails, per pound.....	.13
Bonnell's Water Paste Stove Polish, per pound.....	.13

The following are the discounts of L. S. Starrett, Athol, Mass., on the line of fine Mechanics' Tools of which he is the manufacturer:

	Discount.
Spring Calipers and Dividers.....	25&10&10
Squares.....	25&10
Protractors.....	25&10
Rules and Straight Edges, Steel....	25&10
Lock Joint Calipers and Dividers...	25&10
Combination Dividers.....	25&10
Trammel Points.....	25&10
Surface Gauges.....	25&10
Screw Pitch Gauges.....	25&10
Micrometer Caliper Squares.....	25
Universal Bevel Protractors.....	25
Center Gauges.....	25&10
Scratch Gauges, Steel.....	25&10

Bright Wire Goods are in an exceedingly demoralized condition, and are probably now selling at lower prices than have ever heretofore prevailed. The competition between the manufacturers is active, and nearly all of them unite in making the low prices.

The prices of Chain show a tendency toward slightly higher quotations, which takes the form rather of a withdrawal of exceptional prices than the announcement of new prices. This remark applies to both Fancy and Coil Chains.

The Wire market is firmer than it has been, and a slight advance in price has in some cases been made.

The slight advance recently made in the price of Common Carriage Bolts, by which the discount was made 75 and 2 1/2 per cent. instead of 75 and 5 per cent. as heretofore, with the usual cash discount of 2 per cent., is reported to be generally adhered to.

The situation in Ammunition remains unchanged. A great many goods are being marketed, the trade, however, buying only for their immediate wants, recognizing that the present condition of the market is somewhat unsettled and feeling uncertain as to what further developments may be. The houses which are not in contract with the association, and are selling goods at irregular prices, are understood to have little difficulty in obtaining

Cartridges, and the effect of the irregular quotations which they are making is something of an obstacle in the way of the business of the houses which are maintaining the prices of the association.

Under date September 23, owing to an advance in the price of Lead, the following revised quotations on Shot were announced, there being the usual discount of 2 cents per 25-pound bag if paid within five days from receipt of bill:

Drop Shot, per 25-pound bag.....	\$1.45
Drop Shot, per 5-pound bag.....	.34
Buck and Chilled, per 25-pound bag.....	1.70
Buck and Chilled, per 5-pound bag.....	.39

Trade.

The following report of the Louisville market, which comes under date September 15, will be of interest:

The Hardware trade of Louisville, Ky., continues good, showing no diminution in quantities of goods going out. Prices hold their own well. Manufacturers seem to study the requirements of the jobbers and cater to their wants more than ever, recognizing in them the best distributors of their products. Except in a few unlooked-for advances, particularly on goods that were selling at losses, some factories prepared the dealers for higher prices, allowing them time to secure a limited stock. This is appreciated by the jobbers, who remember the action in their future orders. It also gives them confidence and an opportunity to realize a moderate profit on their purchases. Bar and Sheet Irons are rather scant in stock, as the demand from store is good and the mills rather slow in filling orders, many being oversold, particularly on Sheets.

Wire Nails are firmly held, most mills having full contracts, and the good specifications going in show that their place in the trade is being enlarged. Cut Nails have also held firm, with one pointed exception. Dealers apprehend another advance at the meeting on the 18th, but are afraid to further increase their holdings. They also apprehend that at a moment's notice the pool will be sprung on them. Many favor this plan, while others deprecate it, preferring an open market and running the risk of cut-throat prices, other than have a given profit allotted them. Barbed Wire has been a speculative feature during the week. Some mills that were well secured on orders withdrew the lowest prices, which caused an agreeable movement to those mills who were willing to take a few cars more. They have all ordered an advance and will probably hold to it, and at an early day the nominal association will probably be fixed up. This staple article has had an unprecedented run this season, owing to both low prices and increased consumption. Plain Wire is still low, with prospect of early advances.

There never was such a large trade in Agricultural Machinery and Implements, particularly Grain Drills, which, together with the enormous amount of fertilizers going into the country, show that the present good crops only stimulate the farmers to plant more heavily for next season. The large fruit crop causes an extraordinary rush on dealers and manufacturers for machinery to grind and press it into marketable shapes. The yellow fever scourge, in Florida, is badly affecting trade in the lower cotton States reached by Louisville jobbing houses, causing utter stagnation in certain localities that are panicky. Otherwise the general trade has improved over last week. The city is still crowded with visitors, brought here by the attractions of the fall celebration, which are interestingly managed. During the week magnificent fruit and flower displays were carried on and one night a splendid flambeau parade literally filled the city to overflowing. All of the principal streets are still decorated by day and illuminated by night, arches of colored lights spanning every street crossing.

The Wells & Nellegar Company, 72-76 Lake street, Chicago, have issued an illustrated Wholesale Price Current of Cutlery, Sporting Goods and General Hardware, under date of the 11th inst. In their review of the markets on the first page they say:

Hardware.—The demand for Hardware during the recent summer months has been larger than ever before, and orders have been for general assortment goods, showing conclusively that stocks throughout the West are light, and that the large harvest already assured has stimulated trade to such an extent that the universal cry will be of a scarcity of goods, as we are already experiencing difficulty in getting our orders filled with some lines of goods as fast as the trade wants them. We

are candid in our opinion that firm and higher prices are sure to follow.

For a time we attributed our largely increasing trade to the many customers who came to us about the time of our purchase of the Keith, Benham & Dezenendorf stock, but as there seems to be no let-up to our growing trade, we cannot but feel that the demands of the country are growing correspondingly.

Nails.—Steel Cut Nails are very firm at an advance price of 15c. which occurred on the 30th. Wire Nails have also advanced 20c. per keg, and we expect both Cut and Wire Nails will be still higher.

Sheet Iron is also higher owing to advances in raw material, which is having its effect upon other lines of goods. Sheet Iron, besides being \$4 per ton higher, is very difficult to obtain from the mills, and we suggest to all customers to cover their wants on all heavy goods without further delay.

The circular consists of 16 large pages, covering a variety of goods.

Items.

Boston and Lockport Block Company, Lockport, N. Y., have been increasing their facilities for the manufacture of Snow Shovels and have also added two new styles to their line, the Star and the Eclipse. Their announcement relating to these goods will be observed on page 33.

The Ludlow-Saylor Wire Company, St. Louis, Mo., have taken the agency for the Hartman Patent Picket Fence, which is referred to as having a large sale.

The display made by the Kelly Axe Mfg. Company was a conspicuous feature of the industrial parade at Louisville, Ky., on the 5th inst. A float supported an Axe 20 feet high, which shone like silver, and was followed by a company of 250 employees, all dressed in a neat uniform, and each bearing on his shoulder a brand new Axe, glistening in the rays of the sun.

The Rector & Wilhelmy Company, Omaha, Neb., issue a price current devoted to seasonable goods, including Stove Boards, Elbows, Coal Hods, Fire Arms, Huskers, Meat Choppers, Lanterns, Apple Parers, Axes and many other goods. Quotations are given in cipher, to which a key is furnished.

Butts & Ordway, 145 and 147 Pearl street, Boston, Mass., in their price list, No. 1, represent a line of Nuts, Washers, Screws, Drills, &c. The pamphlet is illustrated and clearly printed, and will be appreciated by the trade as giving the standard lists in convenient form.

On page 75 is the advertisement of Frost's Anti-Rattler. At a glance it will be seen what a wide range its sale has in the United States, and in addition we are advised that they are exported to New Brunswick, Canada, England, Australia and New Zealand. Their popularity is also referred to as constantly increasing.

Hibbard, Spencer, Bartlett & Co., of Chicago, and Simmons Hardware Company, of St. Louis, have each issued very complete catalogues of Rochester lamps. Illustrations and price lists of the various styles are given, embracing parlor, study, fount, piano, bouquet, mammoth, wall and stand lamps. These illustrations not only convey an excellent idea of the different kinds of Lamps belonging to this line, but they also show the artistic finish which embellishes the finer grades.

Hibbard, Spencer, Bartlett & Co., Chicago, have issued another catalogue this month, covering a great variety of seasonable goods, including Tin Plates, Sheet Iron, Metals, Stove Boards, Elbows, Coal Hods, Stove Shovels, Fire Irons and Stands, Stove-Cover Lifters, Coal Vases, Husking Pins, Meat Choppers, Grain Scoops, &c.

The Central Expanded Metal Company, 116 Water street, Pittsburgh, Pa., have issued an attractive pamphlet which is de-

voted to an exposition of their manufactures under the patents of J. F. Golding. It represents a line of Steel Lathing and Netting for fences, gates, window and skylight guards, elevator shafts, &c. Our readers will remember that in a recent issue we gave a description of this new line of goods, and the pamphlet in hand illustrates the uses to which the principle is applied. A number of full-size illustrations are given, showing the different meshes in which the Expanded Metal is furnished, with other illustrations showing in detail the manufactured articles in which it is used. The pamphlet is fully illustrated and gives information in regard to the process of manufacture and the advantages possessed by the product, which will be of interest to many in the trade.

The Schreiber & Conchar Mfg. Company, Dubuque, Iowa, issue a circular which they designate The Silent Traveler, in which they illustrate their Barn Door Hangers, Cylinder Heads, Registers and other goods of their manufacture.

The Winona Wagon Company, Winona, Minn., issue an attractive colored circular relating especially to the Rushford Wagon, calling attention also to their line of Farm and Spring Wagons, Drays, &c.

The Iowa Farming Tool Company, Fort Madison, Iowa, are at present at work on their annual catalogue, and it is expected that it will soon be issued.

A. H. Fisher, representing the Coburn Trolley Track Mfg. Company, Holyoke, Mass., manufacturers of a new Movable Ladder for stores, has opened an office at 131 Duane street, New York.

Haydock & Bissell announce, September 25, 26 and 27, a large sale of Table and Pocket Cutlery, Carvers, Butcher Knives, Plated Flatware, Shears and Scissors, &c., at 12 Murray street, New York. Particulars are given in their advertisement on page 51.

Chas. Elterich, 193 Worth street, New York, announces that hereafter all the goods manufactured and sold by him of his design, invention and patent will bear this trade-mark:

which has been registered, and will be duly stamped on such goods, and where space permits "Elterich" or "C. E." will also be stamped in connection with the trade-mark. The line of goods to which this announcement refers are Taps, Dies, Tap Wrenches, Die Holders, Cutters, &c.

Obituary.

The Sweet & Clark Mfg. Company, Troy, N. Y., make an appropriate announcement of the death of Miles Sweet, who was held in high esteem for his personal worth and the qualities which command the respect of those who knew him. The company announce his death in the following terms:

It is with regret, in which we trust you will share, that we have to announce the death of the senior partner of this firm, Mr. Miles Sweet. Mr. Sweet died this day at his home in this city, aged 61 years. The sincere sorrow of all who knew him proves his worth as a man, and more fitly testifies than can any words of ours to the great esteem in which he was held.

Trade Topics.

We have received the following communication from a Hardware house in this State. It relates, it will be observed, to the condition of things in the Stove trade and the difficulties which dealers in some sections are encountering:

The time has come for dealers to be looking after their Stoves for the fall trade. The subject is attended with a good degree of concern, inasmuch as competition on Stoves is going beyond all reason.

Consumers as a rule, maintain with zeal that Stoves, both for wood and coal, are decidedly

too high—that manufacturers are in a combination, and are holding prices to suit themselves, which means a greater profit than the times justify. With these views many only propose to buy when forced to by sheer necessity; and then not till they have canvassed the county they live in for the very best price. Now comes the most annoying experience a man can have in business. Some Stove manufacturers will sell their Stoves to a general agent, granting him large territories to wholesale and retail their goods in. The result is, said agent opens a retail store at one's county seat, and, sly as the nephew of Satan, tampers with all he meets there, filling them with prices, and styling himself "the Stove king," who can undersell all others, because he gets his at the general agent's prices, which are way below what an ordinary dealer has to pay. If the customer does not warm up and begin to buzz at once, he says, "Strange enough, sir, that I cannot do better than your merchant at home, when, in fact, I sell him all the goods he handles in our line; and now, sir, as a special inducement to you to buy of me, if you will come here and select a Stove or Range you can have the same terms he gets, provided only you will not give me away to him. Of course this is a special, confidential offer to you; but if any of your friends want a Stove you just send them over to me."

It is wonderful how haughty this man will be when he meets his home merchant, perhaps the next day. He will look about the Stove room and make elaborate inquiries how such a Stove works, but when urged to buy he remarks: "I can buy that Stove as cheaply as you can, and cheaper than you can afford to, for I can go and get it myself, and you have to pay the freight on yours." The dealer has no more to say if he knows the man is truthful and honest, but very naturally prays that he will have to do business with his general agent in heaven. This condition of things has annoyed retail Stove dealers about long enough, and it is about time they sought out some scheme to operate in self defense. The only remedy the writer can offer at present is for merchants to refuse, in a body, to handle such Stoves, directly from the makers or indirectly through such an agency, until the above complained of nuisance is abated. It is time this subject was discussed and agitated, for the evil is growing apace, and in certain localities threatens to ruin the Stove trade. It is suggested and hoped that some one who has experienced the same evil will consider the matter more fully for the benefit of the readers of *The Iron Age*. Let us hear from others and have a proposition suggested to be put in force in the near future.

Exports to New South Wales.

The increasing trade which American manufacturers are having with New South Wales is indicated in the following abstract, which shows some of the leading goods in Hardware and related lines which were taken to that market in a single vessel:

PER BRIG PATRICIAN, AUGUST 21, FOR SIDNEY, N. S. W.

By *W. H. Crossman & Bro.*—15 boxes Carpenters' Tools, 1 gross Traps, 1 case Hardware, 2 cases Carpenters' Tools, 22 Guns, 1 case Tools, 50,000 Primers, 50,000 Cartridges, 3 dozen Molds, 6 dozen Brooms, 1 case Hardware, 39 Lawn Mowers, 18 dozen Lanterns, 4 cases Sad Irons, 50 cases Scales, 1 case Toys, 31 Velocipedes, 1 case Stove Parts, 3 sets Tools, 3 dozen Braces, 3 dozen Scales, 1 package Hardware, $\frac{1}{2}$ gross Lemon Squeezers, 24 dozen Traps, 1 case Hardware, 6 dozen Mattocks, 1 case Hardware, 3 dozen Traps, 3 gross Grease, 4 dozen Scales, 4 cases Hardware, 11 dozen Cages, 2 cases Hardware, 1 case Carpenters' Tools, 12 dozen Bench Screws, 20 gross Traps, 2 cases Harness, 475 feet Leather, 7 dozen Axes, 4 dozen Hatchets, 6 Revolvers, 150 shells, 13 cases Hardware, 1 gross Lemon Squeezers, 10 dozen braces, 33 Stoves, 2 dozen Wringers, 7 cases Carpenters' Tools, 100 dozen Shovels, 6 dozen Traps, 6 dozen Mattocks, 18 dozen Hammers, 5 dozen Axes, 2 Scales, 20 Guns, 33 sets Tools, 76 dozen Handles, 28 dozen Hatchets, 10 dozen Axes, 3 gross Traps, 1 case Hardware, 24 dozen Hatchets, 24 dozen Hammers, 5 cases Hardware, 6 dozen Picks, 1336 feet Leather, 1 case Hardware, 25 pounds Nails, 12 Rifles, 12 Sets Tools, 20,000 Primers, 10,000 Cartridges, 36 cases Scales, $\frac{5}{8}$ dozen clocks, 3 cases Hardware, 12 dozen Wrenches, 10 cases Carpenters' Tools, 96 dozen Traps.

By *J. A. Gifford*.—2 cases Harness, 1 case Handles.

By *H. W. Peabody & Co.*—59,896 pieces Slate, 450 pounds Fuse.

By *McLean Bros. & Rigg*.—1 gross Graters, 21 dozen Saws, 30 pairs Barn Door Rollers, 12 dozen Axes, 86 dozen Mouse Traps, 24 dozen Mouse Traps, 84 dozen Pulleys, 6 gross Coat and Hat Hooks, 36 dozen School Slates,

9 pairs Revolvers, 3 gross Chalk Lines, $\frac{3}{4}$ dozen Wrenches, 1 dozen Tills, 26 dozen Curry Combs.

By *Arnold Cheney & Co.*—1000 pounds Buggy, 3692 Buggy Parts.

By *F. B. Wheeler & Co.*—27 dozen Hardware, 17 cases Hardware, 10 gross Brushes, 25 dozen Lamps, 25 dozen Holders.

By *Nevius & Hariland*.—25 gross Shade Rollers, 20 gross Shade Rollers.

By *Winchester Repeating Arms Company*.—50,000 Shells, 71 pounds Metallic Cartridges, 50,000 Shells.

By *A. Field & Co.*—6 cases Rifles and Tools, 2 cases Plated Ware.

By *A. S. Lascelles & Co.*— $\frac{1}{2}$ dozen Plated Ware, 24 Hatchets, 30 dozen Axes, 20 cases Axes, 1 gross Razor Straps, 20 dozen Cutlery, $\frac{6}{8}$ dozen Hardware, 260 pounds Nails, 20 Firearms, 1 dozen Guns, 9 dozen Hardware, 2 gross Shovels.

By *V. Basanta*.—9 gross Toy Pistols, 3 dozen Wheelbarrows, 4 dozen Corn Shellers, 60 dozen Hammers, 95 dozen Handles, 2 dozen Wagon Jacks, 21 dozen Brushes, 1200 feet Hose, 4 dozen Guns, 6 dozen Loading Tools, 100,000 Primers, 16,000 Cartridges, 6 Guns, 40 dozen Shovels, 170 dozen School Slates, 2 dozen Clocks, 10,250 pounds Carriage Bolts, 3 dozen Wrenches, 5 dozen Pumps.

By *R. W. Forbes & Son*.—38 Clocks, 2 dozen Saws, 51 packages Carriages and Parts, 6 packages Hardware, 1 box Cider Mills, complete, 8 packages Hardware, 454 pounds Lining Nails, 24 dozen Axle Clips, 10 pounds Carriage Varnish, 1 box Stamped Tinware, $\frac{1}{2}$ dozen Miter Boxes, 1200 Leather Washers, $\frac{3}{4}$ dozen Sad Irons, $\frac{1}{4}$ dozen Locks, 122 bundles Rims.

By *Arkell & Douglas*.—7 Buggies, 6 Lawn Mowers, 236 pounds Tacks, 134 dozen Handles, 1 dozen Wringers, 6 Stoves, 2 gross Shade Rollers, 309 pounds Slates, 50 dozen Brooms, 24 dozen Handles, 4 dozen Churns, 12 dozen Paint Brushes, 16 dozen Axes, 25 dozen Axes, 80 dozen Shovels, 12 dozen Handles, 40 dozen Shovels, 32 dozen Axes, 32 Churns, 28 dozen Axes, 3 gross Traps, 13 dozen Paint Brushes, 24 dozen Hatchets, 12 dozen Hose, 3285 pounds Bolts, 732 dozen Handles, 30 dozen Shovels, $\frac{1}{2}$ gross Traps, 16 dozen Wire Goods, 9 dozen Saws, 20,000 Cartridges, 39 Wringers, 20 dozen Hatchets, 12 dozen Handles, 6 dozen Toys, 18 dozen Locks, 40 dozen Axes, 5 cases Carriage Hardware, 39 bundles Carriage Hardware, 100 dozen Shovels, 600 dozen Handles, 55 dozen Hatchets, 10 dozen Saws, 120 dozen Sewing Machines, 10 dozen Saws, 90 dozen Shovels, 1 Case Handles.

By *V. Basanta*.—15 dozen Lanterns, $\frac{1}{2}$ gross Hat Racks, $\frac{4}{5}$ gross Whisk Brooms, 96 dozen Lock Blanks.

By *Coombs, Crosby & Eddy*.—10 dozen Axes, 54 Stoves, 7 dozen Braces, 168 pounds Oil Stone, 15 dozen Hammers, 4 dozen Ladders, 62 Stoves, 16 dozen Door Springs, 26 dozen Hardware, 5 dozen Wrenches, 46 dozen Hardware, 11 dozen Edge Tools, 3 Churns, 1 dozen Clocks, 5 dozen Axes.

By *Itley, Doubleday & Co.*— $\frac{1}{4}$ gross Axle Grease, 3 dozen Paint Brushes, 112 pounds Glue, 3 gross Paint Brushes, 6720 pounds of Axle Grease, 336 pounds Glue, 25 gross Axle Grease, 12 cases Carriage Ware, $\frac{2}{3}$ dozen Iron Banks, 3016 feet Leather Belting, 55 dozen Toys, 10 dozen Roller Skates, 12 gross Glass Cutters.

By *R. W. Cameron & Co.*—10 dozen Axes, 60 cases Handles, 7 Carriages, 9650 pounds Machinery, 100 Lamps, 30 gross Polish, $\frac{12}{14}$ gross Axle Grease, 4808 pounds Nails, 35,000 Slate, 21,500 pounds Fruit Jars, 2000 pounds Buggies, 412 pounds Brushes, 14 packages Forges, 41 Barrows, 8150 pounds Woodworking Machinery, 4 cases Saddlery, 7 cases Hardware, 1 case Whips, 30 packages Hardware, 275 dozen Brooms, 1 box Pumps.

By *Singer Mfg. Company*.—173 cases Sewing Machines and Parts, 200 cases Sewing Machine Oil.

By *Strong & Trowbridge*.—1 case Hardware.

By *Welsh & Lea*.—22 cases Iron Bolts.

By *Ansonia Clock Company*.—85 boxes Clocks, 7 boxes Clocks.

By *Reed & Barton*.—42 packages Plated Ware.

By *Russell & Irwin Mfg. Co.*—7 cases Hardware.

By *J. A. Ten Eyck*.—4 cases Wagon Springs.

By *Parker & Whipple Co.*—12 cases Clocks, 2 boxes Clocks.

By *Goulds Mfg. Company*.—4 packages Pumps.

By *J. L. Mott Iron Works*.—37 Stoves.

By *Healy & Earl*.—1 box Emery Rollers, 2 boxes Saws.

By *Collins & Co.*—223 dozen Tools, 290 dozen Tools.

By *Crane & McMahon*.—22 cases Handles.

By *H. S. Chipman*.—1 case Hardware, 2 cases Handles.

By *McCoy & Sanders*.—2 racks Hand Spikes.

By *J. Dixon Crucible Company*.—1 case Lead Pencils, 3 packages Crucibles.

By *F. B. Wheeler & Co.*—1684 pounds Wire Cloth.

By *Waterbury Clock Company*.—25 cases Clocks.

By *R. W. Forbes & Son*.—13 Buggies, 4 cases Reloading Tools, 1 case Handles.

By *Strobel & Wilken Co.*—12 $\frac{1}{2}$ dozen Express Wagons, 42 dozen Toy Banks, 21 $\frac{1}{2}$ dozen Iron Toys, 8 dozen Toy Pianos, 27 $\frac{1}{2}$ dozen Pianos, 35 dozen Tinware.

A White Lead Swindler.

The Pittsburgh White Lead companies have been made the victims of a swindler, whose operations have extended over the past two years. He has succeeded in carrying on his operations in different parts of the country, and thus far has escaped detection and arrest. He goes, at times, at least, under the name of C. F. Randolph, and is described as being about 33 years of age, medium height, sandy complexion, gentlemanly appearance and good address. He has been operating recently among the Hardware dealers in Western Pennsylvania and New York State, and it is thought probable that he designs continuing to work among the Hardware dealers, as the paint houses have been pretty generally warned against him. Girard C. Smith, secretary of the Beyman-Bauman Lead Company, Pittsburgh, thus describes his method of operating:

The man who has been swindling us did not go to the houses that are doing business directly with ours. He is too sharp for that. If he did he would be detected at once. He visited houses that handle our goods, but which do not deal with us direct. His plan is to present his card from whatever house he chooses to select, make some slight concessions in price of his goods, with privilege of long time for payment, and thus secure an order. He then explains that he is in need of money, and produces a forged letter on printed note-head in imitation of the firm, instructing him to make draft if in need of money, and thus induce the dealer to cash the paper or identify him at the bank, in this way obtaining from \$25 to \$75 at a time, the dealer only learning that he was the victim of misplaced confidence upon the return of the draft protested several days afterward. Dealers then deem it too late to make any effort to pursue the rascal, and usually pocket the loss philosophically, at the same time mentally registering a vow to cash no more drafts or advance no money to traveling salesmen. When indorsement of draft is refused he contents himself with obtaining a loan of \$5 or \$10, to be returned in a few days on receipt of remittance from his house. It is probable that his operations are not limited to the White Lead interest, and that he is working other lines of business in the same way. It is estimated that he secures several thousand dollars yearly in this peculiar occupation. The cards presented by him are usually printed in gilt letters on black enameled background, and inscribed: "Manufacturers and corrodors of strictly pure white lead and linseed oil." The letter-heads being ordinary printed ones, this fact alone would excite the suspicion of the dealer, being of inferior character to that employed by any of the firms represented, who use lithograph or engraved work.

He devoted his attention for a long time to small paint dealers and painters, but perhaps owing to his being extensively advertised in the paint journals he seems to have neglected that branch latterly, and is now catering to the Hardware trade, all the dealers who report recent visits from him being engaged in that branch of business. If the trade would keep a vigilant watch for this impostor and adopt the simple precaution to quietly wire the firm when applied to in this way by traveling men whom they do not know personally, the fellow's career would soon be brought to a short turn.

Clerks.

BY KNARF.

As with other things, there are clerks and clerks. There is the clerk with bangs and middle-parted hair, with an odor of Hoyt's German Cologne hovering about him; wears tooth-pick shoes, and busies himself by wiping and rewiping the pocket cutlery samples, especially when the proprietor is about. He has numerous young lady friends, the smaller the town the more numerous they are, and the more frequent their calls on him. He is the leader of fashion among the boys; the originator and organizer of picnics, dances and sleigh rides, while he has not sense

enough to know that locks were once made right hand or left hand, not reversible; or that there was a time when points did not grow on wood screws. He may go far enough to reason that, in his mind, there would be as much propriety in naming a D. H. shovel a "D. H. dirt shovel," because it goes in dirt, as to call an iron or steel screw a "wood screw" because it goes in wood.

Then there is the clerk who finds visiting the neighboring grocery or drug store more necessary to his comfort than seeing that the nail bins are kept full. His name is apt to be "Will" and the query any hour in the day is "Where is Bill." He wears a light colored flannel shirt, prominent necktie, and dotes on being a strawberry blonde. The grocery candy case and drug store soda fountain receive complimentary calls from him daily.

The clerk that was born tired is a very common occurrence. He, as a class, is of no particular physique, so that (being forewarned would be forearmed), we cannot guard against him. He is generally of gentlemanly appearance, good address, and the first impressions received of him are favorable. He is apt to be somewhat particular in knowing just what work will be expected of him, also as to length of hours and engagement. But you reason with yourself that this should be nothing against him, as you would want to know the same things if you were hiring out. So the engagement is made, and the things expected of him remain so—undone to the end of the time you have promised to harbor him. He is full of excuses for his remissness, and in weariness of spirit you wish there were no such things as excuses. You are irritated at finding him occupying your desk and favorite gold pen upon your unexpected return to the store. You wonder how much soldiering he is capable of? He believes, and will reason with you, that there is no such thing as laziness, but that some organisms are born with an inherited lassitude, which is constitutional, and cannot be eradicated. Notwithstanding this chronic disability, he is captain of the "clerk nine" when they have a scrub game of baseball, on the hottest day in summer, with the Green Stockings.

The rarest type of clerk is the most desirable, as is the case with other desirable things in this life. He is steady going, but accomplishes much. Quick to see and willing to do what he sees needs doing; a pleasant word for each customer, and a faculty of holding a second customer until he has waited on the first, almost anticipating their wants, and generally selling them something more than they intended buying. You can leave him in charge of your business and feel assured it is not only well attended to, but honestly conducted; that none of the cash finds its way into other channels than the till. But this kind of a clerk you must needs advance his wages, or some one else will, until you find it to your advantage to give him an interest in your profits and losses, or he may anticipate your kindness and take a double interest, first by engaging the hand of your only daughter and then accepting a partnership in your business.

The clerk of 30 years ago, especially in the country towns, was typical; the species now is almost extinct. A strong, rugged farmer's boy, 15 or 16 years' of age, whose system is full of buckwheat and pork, carrying evidences of the same on his face, hanging his hat on the floor behind the door upon his first appearance at the family table. He is to board and room at his employer's home. The knife is the most convenient mode of transit for food, f.o.b., his mouth being the point of delivery. The partly masticated dinner goes down with a gulp. In a short time these evidences of being a rustic disappear, and

his natural adaptability to environments soon lead him to a more easy carriage and the polite courtesies that make up so large a part of home and business life. Being a member of the family, he was under the eye and care of his employer, which proved to be of untold advantage to him in after life. His associates were scrutinized, and he was expected to be at home after the store closed. His religious training was not neglected, and while his wages were small, perhaps \$25 to \$50 for the first year, for this first year he saved money. As a result after a service of five or six years the raw country boy leaves his employer with a well-formed character, thoroughly acquainted with the business, competent to take a prominent place in the world. This plan of educating a boy in business was subsequent to the prehistoric time of binding them out.

The modern clerk presents a different appearance. Too often, besides getting a knowledge of business in the day time, nights are employed in playing poker, drinking and frequenting places where he would be ashamed to have his best girl know he went. It is too common a course nowadays to need any portrayal here, but we know the end from the start. The roads to success and ruin are in diametrically opposite directions.

The Question of Credit.

A recent issue of the *American Storekeeper* contains some very valuable suggestions on the subject indicated by the above title, and as they appear applicable to all lines of trade we present them herewith for the benefit of our readers:

A universal reply to the question, "How is business?" has come to be, "Business is good, but collections are slow." This reply may be varied as concerns business, but collections seem to be chronically slow. Collections follow as one of the many troublesome sequences of granting credit, and granting credit seems to be with most merchants a necessary concomitant to business. The evils of credit are frequently set forth in our trade exchanges, and articles are often published describing successful methods of collecting bills. These vary from the shotgun policy to the soft-soap policy, but one thing stands out very plainly on them all: They are undignified, unbusiness-like, and, we believe, unnecessary. Merchants who are burdened with slow-paying customers universally regret that they have a credit system, and as universally declare it to be a necessary evil connected with merchandising. We are prepared to admit that credit is, in many cases, a necessary adjunct to a mercantile business, but we cannot admit that it need always be an evil. It simply lies within the merchant's power to make his credit customers a disappointing and profitless feature of his business, or a prompt, reliable class whose payments may be reasonably relied on. To a certain degree the necessity of expending commissions to collection agencies, whose effectiveness in many cases is due to their blackmailing schemes, must be very humiliating to a merchant. It is an evidence that he has placed confidence in unworthy persons, and that his judgment is not worthy to be relied upon. It is an evidence that he did not give that attention to the details of his business which would enable him to conduct it without giving his goods away. It is an evidence that the consumer was a little too sharp for the dealer.

We are well aware that some of our readers who have made bad debts will not thank us for taking this view of the case, but, if they will be patient, we will endeavor to show them that our position is correct. To do this we must consider for a moment what credit is. There should be no difficulty in understanding the nature of credit. It is a loan of saleable commodities without se-

curity. The merchant who trusts a man for a barrel of flour furnishes the man material on which to live while he earns money to pay for it, the flour being consumed when the payment is made. Credit thus permits us to wear out clothing before it is paid for, to consume groceries without having given anything for them, and—in other words—to eat our chickens before they are hatched. The merchants who grant credit place themselves in the position of philanthropic persons who enable their customers to live before they have earned the right to live. There are cases of deserving poor who are temporarily unable to pay for the means of sustaining life, but merchants who feel charitable should support such persons purely as a charity and not as a business policy.

Consider for a moment the position which you, as a storekeeper, occupy. You have invested your money in a stock of goods. If the goods have been paid for, they belong to you absolutely. They are to you the results of saving, thrift and economy. Those goods you can give away if you like, but you possess them because you believe that you can profitably exchange them for commodities you need. In this exchanging process money need not necessarily enter, as your goods could be directly bartered for other goods—as they frequently are for butter, eggs and produce—without any money passing between you and your customers. Money only enters as a convenient and reasonable equivalent for commodities, and your goods should purchase as much money as you originally exchanged for them, plus a sum which will recompense you for placing your services at the command of the public. By taking this view of the transaction, you will see that you might as well loan a man \$10 without security, note, or other evidence of debt, as to trust him for goods which you could exchange for \$10.

At the risk of being wearisome, let us impress this fact thoroughly on your mind. Colwell, a writer of great insight, thus contrasted the credit and cash systems: "Under the credit system no equivalent is given at the time of sale, the payment being postponed for a time definite or indefinite." "This is in direct contrast with the cash or money system, in which every article is either paid for in the precious metals (or their paper equivalents) at the time of delivery, or at some time afterward," the last phrase referring to purchasing of wholesalers, payment being made on receipt of bill. Credit is the general belief entertained of men that their action will correspond to their promises, and is based on the belief in the existence of money actually or prospectively in the possession of the person to whom credit is given.

Let us suppose now that the stock of goods in your store is not entirely paid for. You took what money you had saved and went to the wholesale dealer for your stock of goods, which you desired should equal twice, perhaps, the money you had saved. Did you simply select your goods, pay what money you had and order the balance charged to your account? Ah, no! we have no doubt you remember your interview with the credit man! Did you not have to unbosom yourself quite freely, and did not the firm find out your standing from the various commercial agencies before any goods were delivered? Certainly. You remember it well. Did you take it as an affront and an imputation on your honesty? Not at all. We dare say you furnished all the information asked for willingly, as you should have done, and that you have been careful to maintain your credit ever since.

Let us now come from generalities to particulars. On general principles we prefer a cash business. It is more speedy,

more profitable and less annoying, but we realize that a credit business is much preferred in some localities. Granting this much, we propose to take the ground that a merchant can do a credit business without loss, and without trouble and anxiety. In order to accomplish this, however, he must conduct his credit business as a bank loans money—with caution. As a rule, accounts are forced on a storekeeper. Few customers ever directly ask to open accounts. They send children after things with a lisped request to charge the goods. They ask you to make a slip until they come in again, or they buy more than they can pay for and ask you to "remember the balance." There are hundreds of ways to do it, but the merchant should present a bold front at the first attack. He should not refuse any person credit unless he is prepared to do a cash business, but upon the first application for credit he should have his would-be debtor understand distinctly what credit at his store involves.

Credit should largely rest on a knowledge of a man's financial history and condition. It should not be refused to a man who all his life has met every engagement, nor should it be extended to one who has regularly failed therein. Your own judgment of the man's character should not be relied upon to guide you in this matter, because there is a natural inclination in the human mind to magnify that which is not certain, and we are apt, therefore, to ascribe more means to a man than he really possesses. A merchant should be guided in granting credit to a person by: 1. The positive amount of capital possessed or the ability to earn wages. 2. The general fidelity displayed in past engagements. 3. The co-operation which the law will give in the collection of the account, if necessary to proceed to law. It is well to know the extent of protection the law throws around a debtor, because, as Charles Francis Adams has pointed out, "The first reliance of a creditor is commonly upon the good will of his debtor; the second upon the law of the land."

Recognizing that the person to whom credit is given is the one accommodated, and not the merchant, it is well to throw off this absurd fear of losing trade and of being obliging, &c., and maintain a stiff control of your credit. If a person tries to enforce credit on you, stop right there and have a plain talk with him, or, if easier, have your talk printed. It might be well to ask him if he wished to open an account, and to tell him, if he does, to make application in regular form, as do all your credit customers. On this form there should be a statement something like this:

"We endeavor to sell only the best goods and at the best prices. These prices are based upon a cash business. To conduct a credit business costs more and reduces reasonable profits, or increases the prices to cash-paying customers. Those who receive credit should be willing to pay interest on the amount of their purchases, and should willingly furnish information on which I can base an opinion as to their financial responsibility. I do not desire poor paying customers. If you are prepared to submit the following application for credit I shall be pleased to consider it.

JOHN JONES."

"APPLICATION FOR CREDIT."

"I desire to apply for credit for groceries to a sum not to exceed ten dollars a month. I agree to pay promptly on the first of each month and will pay six per cent. interest on the amount of my purchases. I am employed by John Smith and have been with him for two years. Previous to that I worked for John Brown. I rent my house of John Green, to whom I refer you. I buy my dry goods of John Black and my meat of John White. In case I do not pay my bills promptly on the first of each

month you are authorized to use this as an order on John Smith for my wages.

"Very respectfully,

"JOHN REDDING."

In this blank form the words in italics are those which the applicant is to write. The form can be varied indefinitely or not used at all, but the principle remains the same: Investigation before trusting people with your goods. You not only submit to it in buying, but expect it, and the same principle should govern you in selling. Credit is impossible without confidence, and confidence is disastrous without knowledge. We undertake to say that there would be fewer victimized merchants if some such credit investigation was universal. There is no reason why it should not become universal, because it is just, and honest men admire justice. Always remember and teach your customers to remember that "money talks," and that "credit is an excellent walking stick, but a treacherous crutch."

Legal Decisions.

ASSIGNMENT FOR BENEFIT OF CREDITORS.

C. & H. made a general assignment, and their balance in bank was \$3069.61. The bank had discounted notes for them for \$11,500, of which \$7000 fell due, and protests were made before the assignee demanded the amount on deposit. This demand was refused on the ground that the bank had the right to set off the indebtedness of C. & H. to it against their balance on deposit. The assignee then brought suit—Chipman *vs.* Ninth National Bank—but was defeated, the court ruling that the bank's contention was correct. The case was carried to the Supreme Court of Pennsylvania, where the judgment was reversed. Judge Sterrett, in the opinion, said: "It is clear that at the date of the assignment the bank had no lien or set-off against the amount then on deposit to the credit of C. & H., and that the assignee, by virtue of the assignment, and as trustee for the creditors, was then entitled to assert his and their right to any property of the assignors which passed by the assignment, against any person claiming by subsequent transfer, attachment, judgment, execution or any other lien. The reason of this is that the rights of the assignor's debtors and of his creditors are fixed by the assignment. The creditors cannot attach or levy on the assigned assets, and the debtors cannot buy up claims against them and set them off against claims against the assigned estate. The bank, in this case, had no right of action at the date of the assignment, and as a creditor of the assignors, holding notes that matured after all of their property, including the money deposit, had passed to the assignee in trust for all of the creditors, the bank is in no better condition than they are. The deposit must be paid over to the assignee, and the bank must take its place among the other creditors."

SALE OF PROMISSORY NOTES.

W. & Son became insolvent, and S., who held \$7500 of their unpaid notes, agreed to sell them to G. for \$3000. He, however, refused to deliver the notes, though he knew they were bought for a certain purpose, and G. brought suit to compel him to do this instead of suing for damages, and he got a judgment requiring the transfer of the note on the payment of \$3000. The case—Gottschalk *vs.* Stür—was carried to the Court of Appeals of Maryland, where the judgment was affirmed. Judge Robinson, in the opinion, said: "Though the courts will not in all cases decree the specific performance of a contract for the sale of goods and chattels, because there is an adequate remedy at law in damages,

yet it is well settled that when there is an agreement to buy a specific chattel for a specific purpose, and this purpose can only be answered by the delivery of the chattel itself, or where from the nature of the subject matter of the agreement the measure of damages must necessarily be uncertain, or where damages will not be as beneficial to the purchaser as the performance of the contract, equity will interfere and decree the specific performance of the contract; because in such cases an action at law for a breach of the contract will not afford the purchaser a complete and adequate remedy. Now, in this case these notes were bought to be used for a specific purpose; a judgment for damages for their value cannot be recovered, for their value cannot be shown, as the makers are insolvent, and it is very evident that to do justice here we must affirm the judgment below which compels the transfer of these notes upon the payment of the price fixed, \$3000.

CORPORATION SUIT BY ONE STOCKHOLDER TO COMPEL AN ACCOUNTING.

D. was a stockholder in the Travelers' Newspaper Association, and he sued for an account in behalf of himself and such other stockholders as should elect to come in the corporation, and Roland Worthington and Roland Worthington, Jr., as directors of the company. It was alleged that Roland Worthington is the president and treasurer of the association, and has long controlled the majority of its stock, by means of which control he has chosen such persons for directors as he has seen fit; has improperly invested money; has kept uninvested large sums of money; has given himself an excessive salary, and has charged an improper and unjust rent for the premises occupied by the corporation, and owned by him. The relief asked was an accounting, a return of moneys improperly taken, a just distribution of the profits of the concern, and that all the funds in excess of \$5000 be paid out to the stockholders. There was no allegation that D. had applied to the officers of the corporation for an account, or that he had brought his grievances before the association itself to get relief. The defendants demurred, and the case—Dunphy *vs.* Travelers' Newspaper Association—was taken to the Supreme Judicial Court of Massachusetts for argument. Judge Knowlton, in sustaining the demurrer, said: "Stockholders must seek relief first through corporate channels, surely one stockholder cannot of his own will force the corporation into a course of litigation. Still, if the corporation itself refuses to redress fraudulent acts, a stockholder can have relief in a court of equity. In this bill in equity there are sufficient allegations of Roland Worthington's contract of the board, but it does not show that any effort was made to get relief from the corporation itself, and there is no allegation of any fraudulent combination between Roland Worthington and the other directors to injure the corporation and the plaintiff. The bill is therefore insufficient, and the demurrer must be sustained."

The East Birmingham Iron Roofing and Corrugating Company, of Birmingham, Ala., have been reorganized by the election of the following officers: President, General Rucker, of Alabama; vice-president and treasurer, Joseph F. Johnston, president of the Alabama National Bank. The above, with H. P. Lloyd and L. L. Sagendorph, constitute the Board of Directors. S. H. Wilkes, the acting manager of the company, reports a prosperous business and the outlook promising.

Mayor Hewitt has already forwarded for the relief of Jacksonville over \$36,000.

WEST INDIES.

PORT OF SPAIN, TRINIDAD, August 17, 1888.—*Asphaltum*.—Our market has been moderately active and well sustained at \$14.04 per ton, inclusive of export duty, boiled and crude, at \$6.84. Exportation since January 1 amounts to 35,131 tons, against 29,578 last year and 21,889 in 1886. *Exchange*, 90 days' sight, \$4.84.—*E. P. Masson*

CHINA.

CANTON, July 28, 1888.—*Silver Coin*.—The Chinese Government has made a contract with Mr. Heaton, of Birmingham, England, for a complete set of mint machinery for the coining of Silver dollars and fractional coin with a capacity of turning out \$128,250 per day, or 2,700,000 coins, including Copper coin. The latter will have the traditional square perforation in the center. *Iron and Coal Mines*.—A railroad is to be built to connect Packhoi with the rich mines at Lientchu, in the Longchuan district.—*Weekly Mail*.

EAST INDIES.

SINGAPORE, July 25, 1888.—*Tin*.—Our last report was dated 11th inst., since when the advance in London has given buyers more confidence, and sellers have begun to realize their holdings. About 200 tons have changed hands at up to \$34.50 per picul, with buyers at this price still offering. *Gum Copal*.—There are large stocks which are offering at some decline, but the demand is lifeless. *Gum Damar*.—The arrivals have been of inferior quality; we quote \$17.50 per picul for Lingah. *Tonnage*.—London rates are steady at 25/ @ 30/ for weight. For New York via Canal there is no tonnage offering; via Cape the Tabique and Sonntag have been circulated at 25/ for weight. For Boston the Hooghly loads on charterer's account. *Exchange* is quoted 3/1, for six months' sight credits. Tin shipments from the Straits Settlements to the United States during the first six months have been as follows: 1888, 13,877 piculs; 1887, 43,075; 1886, 31,533; 1885, 16,051; 1884, 26,651, and 1883, 52,489.—*Gilfillan, Wood & Co.*

PENANG, August 4, 1888.—*Tin*.—Since our last report of the 20th ult. receipts amounted to 11,000 piculs, of which Europeans took 7200 and Chinamen 3000. Prices meanwhile advanced from \$33.65 to \$34.50, but the exchange on London brought the quotation down to \$34.10 at the close. *Exchange*, four months' bank, 3/3¼.—*Schmidt, Kustermann & Co.*

MANILA, September 10, 1888.—*Hemp*.—During the week there have been buyers at \$10.25 per picul, against \$9 same time last year, equaling per ton, cost and freight, £35, against £33. The clearances for the United States since last cable have been 16,000 bales, against none in 1887, and since January 1 125,000, against 150,000; there are still loading for the same destination 42,000, against 20,000. Cleared for England since January 1, 242,000 bales, against 148,000, and loading 1000, against 8000; cleared for all other countries, 51,000, against 29,000; receipts at all ports since last cable, 28,000, against 10,000, and since January 1, 427,000 bales, against 344,000 last year and 276,000 in 1886. *Freight*, \$6, against \$6. *Exchange*, 3/5, against 3/9.—*Ker & Co. to Charles Nordhaus, New York, per cable direct*

COLOMBO, CEYLON, August 2, 1888.—*Plumbago*.—Since our last report the market has exhibited great firmness; we quote in rupees, per ton: Large lumps, 145 @ 170; Ordinary lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 65. Following are the shipments made since October 1: To England 67,547 cwt.; to Marseilles, 38; to Trieste, 523; to Hamburg, 10,942; to Antwerp, 3964; to Bremen, 2012; to India, 82; and to the United States 130,332—together, 215,440, against 214,858 cwt. last year, 173,844 in 1886, and 171,929 in 1885. *Coin Yarn*, Nos. 1 to 4, may be quoted 7 @ 12 rupees per cwt. *Exchange*, 6 months' sight credits, 1/4 15-32.—*Volkart Bros. through their Agent, John W. Greene, 82 Wall street, New York*.

SPAIN.

BILBAO, September 1, 1888.—*Iron Ore*.—There has been great animation during the week, the tendency at the same time being upward. We quote Campanil 7/6 @ 8/1, and Rubios, 6/10 @ 7/3; in a few instances, on smaller lots, an advance has been submitted to. The week's shipments sum up 66,877 tons, which

is nothing very great, compared with former years at this season, but it appears that many steamers in the habit of calling here for cargo went elsewhere to earn bigger freights. Total shipments hence since January 1 aggregate 2,560,999 tons, against 3,070,284 last year. *Pig Iron* is firm; coastwise 874 tons were shipped and abroad 1496.

Export from Spain During the first Six

	Months.	1886.	1887.	1888.
	Tons.	Tons.	Tons.

Totals... 2,656,777 3,274,906 2,925,497

With the exception of Pyrites every item shows a retrograde movement. Spot *Pig Iron* quotations are 57 @ 60 pesetas or francs per ton, f.o.b., futures, 55 @ 58; Lingotillo at Huelva or Seville, 65.—*Bilbao Marítimo y Comercial*.

GERMANY.

HAMBURG, September 8, 1888.—*Iron*.—The Rhenish-Westphalian *Pig Iron* market has been steady. Spiegel has been quiet on the whole at 54 marks for 10 % @ 12 %, the home market being dull and nothing doing for American account. English consumers have had a good chance to resume purchases and their operations continue. Stocks are the same as last year. The new orders are all the way to the close of 1888. Forge *Pig* has ceased to be offered so very low from Siegen, where the price is now 46 @ 47. Foundry *Pig* is sustained; Thomas is selling best; Luxembourg is quoted 40.50; English Bessemer, 44/6. Merchant *Iron* is doing better, both at home and for export; prices are moderately remunerative. Boiler Plates are as active as ever and Thin Sheets are also looking up. Both foundries and machine shops are in a flourishing condition and the tendency in Castings is upward. Car works do a large trade, and, two months hence, there will be added the Government adjudications. The quotations at the works are: For Merchant *Iron*, 125 @ 127.50 marks per ton; Hoops, 132.50 @ 135; Bessemer Billets, 135, and Steel Rails, for mines, 115. The Schwartzkopff Machinery Company have declared a dividend for the fiscal year just ended of 22 %, against 35 % the previous year, sales of machinery not having exceeded 5,000,000 marks, against 8,820,000 then. The Rhenish Steel Works have declared an 11 % dividend, against 9 %; the difference arises from the low price obtained for Steel Rails. Wire Rods, after deducting the export bonification, are selling at 115 marks. *Metals*.—Lead has been firm, both Copper and Spelter are improving.—*Bor-senhalle*.

RUSSIA.

ST. PETERSBURG, September 3, 1888.—*Petroleum*.—The movement to substitute Naphtha for Coal is making steady headway in a good many localities in Russia. Thus, at Moscow, Naphtha supersedes Coal rapidly as a fuel for manufacturing purposes. The saving in freight is so great that the cost of Naphtha as a fuel is only 7 rubles, where that of Coal is 10. The influence of this change is already felt in the Donetz Coal Basin and the industries there existing. Miners are scarce and the supply of Coal is insufficient; hence in every direction Naphtha is resorted to. At Odessa the scarcity of Coal is causing great inconvenience and there is a general outcry against the duty on English Coal.—*Journal de St. Petersburg*.

An improved Air Pump.

The ordinary type of air pump with clack valves is open to two objections. Whether it be a vacuum or compression pump, the piston only begins to draw in a fresh charge of air when it has advanced a certain distance, and thus reduced the pressure behind it to something less than exists in the inlet pipe. The quantity of air drawn in during a complete stroke of the piston is therefore always less, and may be considerably less than the volume swept by the piston. This reduction in the volumetric efficiency of the pump depends on the amount of clearance space, and on the ratio between the pressure in the inlet and that in the discharge pipe. With a clearance of 5 per cent., a vacuum pump of the ordinary type would only have 50 per cent. volumetric efficiency when producing a vacuum of one-tenth of an atmosphere; and if required to exhaust

down to one-twentieth of an atmosphere the volumetric efficiency would be reduced to zero—that is to say, the valves would not open at all, and no air would be discharged. If the pump be required for compression a limit of pressure would similarly be reached when no more air could be discharged. To make up for the loss in volumetric efficiency, even when working below this limit, it is necessary to employ a larger pump than would suffice if the clearance space could be reduced to zero. This is, of course, a practical impossibility; but this space is sometimes reduced to a certain extent by the introduction of water in the so-called wet-air pumps. These pumps must, however, be worked at a low piston speed to avoid shocks. These defects of the ordinary air-pump have been remedied in the type introduced by Messrs. Burckhardt & Weiss, of Basle, Germany. A description and illustrations are published in a recent issue of *Industries*. The clack valves, which cannot be used in a pump running at high speed, have been replaced by an ordinary slide-valve; and the prejudicial effect of the clearance space has been minimized by an ingenious contrivance, which, at the end of every stroke, permits the air in front of the piston to pass round it to the other side. A device of this kind had already been introduced for air-pumps nearly ten years ago. It consisted of short channels or grooves placed at either end of the cylinder in such a position that the piston, when at the limit of its stroke, establishes communication between the two sides of the cylinder.

This somewhat primitive method has been improved upon in the pump we are about to describe. A channel is placed within the slide-valve, by means of which the two ports are momentarily brought into communication at each end of the stroke. The compressed air in front of the piston is thereby permitted to pass round through these channels to the back of the piston, so that when the return stroke commences, the pressure behind the piston is very nearly that existing in the inlet-pipe, whilst the quantity of air which has passed to the other side of the piston is expelled, together with air drawn in at the previous stroke. We may here remark that a similar arrangement—viz., a small channel within the slide-valve, is sometimes used in steam engines to admit a cushion of steam to the front of the piston just before it reaches the end of its stroke. The slide-valve of the pump in question carries on its back a clack-valve, held on by a spring. The object of this arrangement is to prevent the air in the outlet-pipe from rushing back at the beginning of each stroke, when the air within the cylinder has not yet been compressed to the same degree as at the end of the stroke. If air were allowed to flow back, this would not lower the volumetric efficiency of the pump; but as the pressure against the face of the piston throughout the whole of the stroke would be equal to or slightly larger than the pressure in the delivery pipe, it would entail a waste of power, and reduce the dynamic efficiency. By putting a clack-valve on the top of the slide-valve, the full pressure of the discharge is kept away from the piston until some later point in the stroke, when the air within the cylinder has been compressed sufficiently to open the clack-valve, and flow out into the valve-chest and delivery pipe. The machine is a combined steam engine and air pump, both the steam and air cylinder being bolted to the same cast-iron bed plate.

The steamship City of New York is said to have burned 290 tons of coal a day, when running at three-quarters speed.

Humphrey's Wood-Workers' Knife.

By means of the engraving herewith we lay before our readers a very convenient tool, which is being offered the trade by the Humphrey Tool Company, of Warren, Mass. The manufacturers state that while this knife, by reason of its shape and construction, is peculiarly adapted for

The manufacturers emphasize the simplicity of this arrangement, the absolute firmness with which the bolt head is held in place, and the convenience that results from having a latch thus reversible. The latch is made with heavy japanned iron case, 4 x 2½ inches, heavy brass bolt, nickel-plated draw-back and turn stop knobs, bronze stop escutcheon, five

tion of doing the best work, no leaks occur, no paint is allowed on the boiler until after it has been tested, and in many cases 150 pounds pressure does not cause one drop of water to come through seams.

The Samson Jack.

This article, an illustration of which is herewith given, is manufactured by Biglin & McMullan, 589 Hudson street, New York, for whom J. C. McCarty & Co., 97 Chambers street, New York, are agents.

Humphrey's Wood-Workers' Knife. Handle and Blade apart.

use by woodworkers, it will be found very convenient and useful in many other lines of trade. The handle of the knife is made of hardwood and tipped with brass, which renders it very strong and durable. It is smoothly finished and of such shape and size as to easily fit the hand of the operator. The blade, which is 6 inches long, is made of the best quality cast steel, carefully tempered and tested. It is V-shaped in cross section and fits an opening of corresponding shape in the end of the handle. A set-screw, not shown in the engraving, is placed in one end of the handle, and when the blade is in position forces it firmly into the bottom of the opening in the handle; by this means any length of blade desired may be secured. The construction is such that when the knife is not in use the blade may be reversed in the handle, which protects the edge and tends to keep it sharp. Two widths of blade are made—viz., 1½ and 1¾ inch. In the engraving presented herewith the blade and handle are shown apart.

tumblers and two flat keys. They are packed separately in boxes with both box nosing and flat brass striker.

New Snatch-Block.

The Cleveland Block Company, Cleveland, Ohio, have patented and are introducing to the trade a new style of snatch-block which is illustrated in the accompanying cuts. This block has, it will be observed, a sliding strap to which is attached the hook and through a slot in which the steel pin passes. With this construction the block, it is claimed, when closed and ready for use, is as strong as a tackle block with both sides complete, and it is alluded to as combining safety, strength, ease of manipulation and general efficiency.

The latest idea in boiler construction, says the *Locomotive*, is to leave several bad leaks in the boiler to allow for expansion. Expansion of what is not stated, but some one who is described as a competent engineer says it is so, and that boiler-makers

The Samson Jack.

The jacks are made under patent of John Parr, of which the manufacturers are sole owners. They are described as made of the best refined malleable iron, thus securing great strength, and the point is made that they will last for years without repair, and are warranted not to break. As will be seen from the illustration, the jack is

Barnes' Reversible Night Latch.

This article, which is made by the Barnes Mfg. Company, New Haven, Conn., for whom Sise, Gibson & Co., 100 Chambers street, New York, are sole agents, is represented in the illustration herewith given,

Barnes' Reversible Night Latch.

in which part of the cap is broken away in order to show the construction, which is the special feature of the latch. As indicated in the cut, the latch can be made either plain or reverse bevel as desired. To accomplish this the cap is to be removed and the small lever which rests on the head of the bolt raised, when the bolt head can be drawn out, permitting it to be turned over and replaced, when the lever being shut down tightly and the cap replaced, the operation is completed. The cut shows the lever up and the bolt head out and ready for reversing.

New Snatch-Block.

prefer to have new work show leaks for the above reason. Now, this may be so, but if it is, why is it that seams are calked destructively, painted sometimes, puttied, and even have driven into them wooden shims to prevent leaks when getting ready for the hydrostatic test? And why is it that in those shops where they have the reputa-

operated by a handle or lever bearing a pawl, which catches into a ratchet-wheel, and on the shaft of this ratchet-wheel is a pinion, which engages with the rack. On the lever there is a spring bearing on the pawl, by which its efficiency in working is secured. There is also another pawl, shown in the cut, which prevents the turn-

ing of the ratchet in the reverse direction while lifting the lever for a new stroke. With this construction and the strength of the parts it will be seen that the jack is capable of lifting a heavy load with ease and efficiency. The load can also be lowered without difficulty. These jacks are made in three sizes, No. 0, the metal portion of which weighs 8 pounds, adapted to the use of light vehicles, such as carriages and business wagons, with a lifting capacity of 1500 pounds; No. 1, the metal parts of which weigh 14 pounds, adapted to the intermediate weights of wagons and trucks, and has a lifting capacity of 3000 pounds, and No. 2, which is shown in the illustration, the metal parts of which weigh 24 pounds, adapted for all kinds of heavy work, such as heavy trucks, vans, express wagons, &c. This size is in use in the New York Fire Department, and is also used by a number of well-known houses whose business requires the use of heavy wagons and trucks. The manufacturers emphasize the merits of these jacks as being increased power, quickness of motion and saving of time and labor, and offer them to the trade, confident that they will be found to supply a want.

Eureka Pipe Bending Appliance.

A device of especial interest to the plumbing trade is being manufactured by H. A. Haskell, 38 Chardon street, Boston, Mass., his New York agents being the Colwell Lead Company, 63 Centre street. The Eureka Pipe Bending Appliance consists of a tightly coiled steel wire spring, wound to a size that will just fill the pipe. Its application is exceedingly simple, as all that is necessary to do is to insert it in a pipe and then bend the pipe into any desired shape. The appliance, in other words, serves the purpose of a core, and beside being much more convenient than filling the pipe with sand or rosin, it is

Samples of Bent Pipe.

said, furthermore, that the results are much better. When the pipe is bent to the desired shape the bender is turned a few times to the right which, tightening the coil, permits it to be withdrawn from the pipe. It is spoken of as especially useful in bending lead pipe above 1 inch in size for goose-neck or other irregular forms without flattening or collapsing. The illustrations herewith given show pipes bent by the aid of the Eureka Pipe Bending Appliance, and are presented as illustrations of the even work which it accomplishes. The device is at present made in eight sizes from 1 to 3½ inches.

Combined Measure and Steam Cooker.

In the accompanying illustration we present a general view of an improved steam tea-kettle cooker and measure combined, which is being placed upon the market by Mr. H. M. Hillson, Lewis and Fulton streets, Boston, Mass. The device is made of the best charcoal tin plate, with the body stamped in one piece. It is provided with a strong handle and a

cover which closely fits the top. The utensil is made tapering from the top toward the bottom, and it is claimed will fit any tea-kettle. The body of the vessel is stamped in such a way as to indicate

Hillson's Steam Cooker and Measure Combined.

various capacities, ranging from 1 pint up to 2 quarts, the figures being clearly shown in the engraving. The device is neatly finished, and it is stated that when once introduced no housekeeper would be without one. As a pudding boiler it is

business portions of enterprising towns and cities. In nearly every such instance some of our hardware friends have been among the victims. One of the latest towns to suffer a loss of this character is Washburn, Wis., across the bay from Ashland, which was visited by a serious conflagration on the 14th inst., causing an aggregate loss of \$150,000. Included in the list of business houses destroyed is that of Peter Nelson, hardware merchant, whose loss is put at \$15,000.

The New Ideal.

The annexed cut will give the reader an idea of a complete and compact implement for loading brass or paper shot-gun shells. This tool is being put on the market by the Ideal Mfg. Company, P. O. Box 1064 B, New Haven, Conn. Its operation is thus described: To expel the exploded caps unscrew threaded head C as far as it will go; slip up the rammer D, which will project pin at E ready for decapping. To recap, screw the head C down until the

The New Ideal.

claimed to be without a rival. Patents are pending, covering the principal features of construction. The vessels are packed in bundles of one dozen each.

Electricians' Pocket Tool.

The E. S. Greeley & Co., 5 Dey street, New York, are putting on the market a pocket tool for electricians which possesses a number of useful features. The shape and general appearance of the article is shown in the illustration, the cut being a slight reduction from the actual size. It is described as made of the best tool steel, and is nickel-plated and of fine workmanship. Beginning at the right of the cut it will be noticed that there are three wrenches, ½, ¾ and 1 inch size respectively. The top of the tool is formed into a wire gauge, the particular illustration showing the Birmingham wire gauge, though it is also made for the other standard gauges. The other edge, as shown, is a millimeter scale, while

point of screw at A is about flush (as in cut); start primer in pocket of shell, and place head of shell in slot B, and one-quarter of a turn of the rammer will force the primer home. The screw is quadruple thread, and travels ¼ inch in one turn. For extracting shells that may stick in gun put slot B over head of shell, and use rammer as a handle. When used as a rammer screw head C down as far as it will go; this will withdraw the decapping pin within the rammer, leaving all compact and the end flat. The operations are referred to as all simple and quick and efficient.

The Philadelphia Natural Gas Company, of Pittsburgh, has adopted a system of measurements by which it can estimate pretty accurately the exact amount of gas consumed by a large mill or manufactory in a year. By experiments the company has ascertained just how much gas at a certain furnace will pass out a certain sized orifice in a given time. Before any contracts are renewed or new ones made with

Electricians' Pocket Tool.

the reverse side is scored in inches, admitting a ready comparison of the two scales. The left-hand end of the tool is a screw driver, while between it and the gauge part the metal is ground down so that it can be used as a stripper for insulated wire, a cleaner or pencil sharpener. The tool is neatly finished and provided with a case that permits it to be conveniently carried in the pocket.

It has been our lot of late to chronicle quite a number of destructive fires in various parts of the country, devastating the

manufacturers, expert measurements are sent to the mill. Each furnace is carefully inspected, and all measurements and estimates reduced to writing for use of the company. After these have been carefully gone over, the price is given.

The Old Dominion Iron and Nail Works Company, of Richmond, Va., are distributing nails manufactured from the iron plates of the Confederate ram Merrimac, famous for its fight with the first monitor. They are in demand as mementoes of the first naval engagement of the civil war.

CURRENT HARDWARE PRICES.

SEPTEMBER 19, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

THE IRON AGE

THURSDAY, SEPTEMBER 27, 1888.

Duplex Pump with Receiving Tank.

We show on this page a duplex pump with receiving tank built by the Volker & Felthousen Mfg. Company, of Buffalo, N. Y., and designed for use in draining radiators, heaters, steam jackets, &c., and feeding the water of condensation direct

The Priestman Petroleum Engine in the United States.

Those of our readers who have more attentively followed the developments in connection with engines other than steam will be interested to know that arrangements are being made for the sale of the

moreover, being a prominent claim made for the Priestman engine. So far as the mechanical details of the engine are concerned, we would refer our readers to a description published in our issue of June 14. We will briefly repeat here, however, that the engine is single-acting, with an explosion at every second revo-

DUPLEX PUMP WITH RECEIVING TANK AND AUTOMATIC ATTACHMENT, BUILT BY THE VOLKER & FELTHOUSEN MFG. COMPANY, BUFFALO, N. Y.

to the steam boiler. It does away with the expense and annoyance of traps and returns the condensed steam to the boiler as fast as it accumulates in the receiver above the pump. The variation of the steam pressure does not affect it, and it stops the usual water hammer in pipes. The pump and receiver, moreover, serve a good purpose in regulating brine circulating in refrigerating machinery and other similar uses. The water cannot accumulate in any quantity, as it lifts a float which opens the steam-valve to the pump, thereby starting the pump, which forces it to the point desired. The details of the arrangement are clearly shown in the illustration.

patents in the United States of the Priestman petroleum engine, which at present is performing very satisfactorily in England. Through the courtesy of Mr. Robert O. Ritchie, who represents the English syndicate now controlling the American patents, we were favored last week with an exhibition of two of the engines in actual working condition at 106 Washington street, New York.

One of the engines shown is rated at four and the other at one horse-power, and both strikingly illustrate the advantages of motors of their class, such as simplicity, ease of management and ready adaptation to any locality, great economy of oil,

lution, the charge being lighted by a spark from an induction coil worked by a single large cell. A supply of oil sufficient for a day's work is held in a tank in the engine base, and from there is conducted through a spray-pipe to a vaporizer, which, when starting, is heated by a small lamp, but afterward by the exhaust. A suitable supply of air also is admitted to the vaporizer, the proportion of air to petroleum being adjustable, so as to insure a proper explosive mixture. The charge is taken into the cylinder at the outstroke of the piston and compressed at the next instroke. At the following outstroke it is fired, and the exhaust takes place during

the fourth stroke. The action in this respect is similar to that of the Otto gas engine. A valve in the inlet-pipe prevents the propagation of the explosion back into the vaporizer. There is no slide-valve, properly speaking, but simply an exhaust-valve, which is worked by an eccentric. To the eccentric rod is attached, by means of an insulating handle, a metal knob, which describes a path somewhat resembling an ellipse, and is so placed that once in every revolution of the eccentric—that is to say, once in every second revolution of the crank, it bridges two metal springs which are insulated from each other and from the framework of the engine, and which form the terminals of the primary circuit of the induction coil. By this means once every second revolution the induction coil is set going and the charge fired at the right moment. It is claimed that no lubrication is required for the cylinder, the petroleum vapor serving to keep the surfaces in good condition.

Any of the refined varieties of petroleum can be successfully used, and crude oil has also been used with the best results. As to the actual oil consumption, we have before us a report of a test made a few months ago by Sir William Thomson. The figures, which he obtained with an engine loaded by means of a brake, with slightly more than six horse-power, showed a consumption of 1.71 pints per hour per brake horse-power. The whole of the oil is consumed and not only the lighter portions, so that there is no useless residuum. In view of the fact that the engine is said to show great regularity of running, it would appear to be well adapted to electric lighting purposes aside from its general utility in other directions, and in fact we are told that this is one of the uses to which it has been put with eminent success. With an early sale of the patents, it is not unlikely that the manufacture of the engine will soon be carried on here, a result to which small power users will, no doubt, look forward with interest.

The Loomis Fuel Gas Plant at Tacony.

The Loomis Gas Machinery Company have nearly completed the plant built by them under the patents of Burdett Loomis, of Hartford, Conn., at Tacony, Pa., in connection with the saw and file works of Henry Disston & Sons, at that place, a suburb of Philadelphia. While this particular plant is housed in a corrugated iron building, 40 feet by 98 feet, a works of the same capacity would only require a structure of 22 feet by 60 feet. Among the numerous systems designed to meet the growing demand for gaseous fuel for domestic and factory use that of Mr. Loomis, has occupied a prominent place. For three years a Loomis plant for manufacturing illuminating gas has been in operation at Cottage City, Mass., while the first fuel gas plant has been running regularly for over a year at the works of the John Russell Cutlery Company, at Turner's Falls. The works at Tacony have been in partial operation for some time past, while a large fuel plant is being built in connection with the Addyston Pipe and Foundry Company, at Addyston, Ohio, near Cincinnati. A contract has been closed lately for a large plant for manufacturing gas for factory and city use for Akron, Ohio, an illuminating works for Kenosha, Wis., and a fuel plant for the Waltham Watch Company, at Waltham, Mass., to furnish gas for all their boilers, or for forging, crucibles, annealing furnaces, soldering, tempering, &c.

The leading point in which the Loomis system differs from other methods of manufacturing water gas is that the generator is

run by down draft during the period when the coal is being brought to incandescence to decompose the steam passed through it in an opposite direction to manufacture water gas. The process therefore consists of two distinct periods, producing two products—one, generator gas made during the period of "blasting" when air is drawn through a column of fuel downward by an exhauster; second, water gas, produced by allowing steam to enter from below into the column of incandescent fuel, being carried off by a series of tuyeres in the generator above the fuel line. The advantages claimed for the down-draft system are that when the coal is being made hot during the blasting period, preliminary to the manufacture of water gas proper, the volatile gases passing down through the hot coal are fixed. In other words, the troublesome tars, &c., are decomposed. The down-draft system, it is claimed, tends also to reduce clinkering, there is no poking from the top, and the coal is charged during the blasting wherever spots of fire begin to show.

The Tacony plant consists of four generators, having a 9-foot outside diameter, 6-foot diameter fire-box, and 14-foot height, with a fire-brick grate and an air-tight charging hopper. Connected with the ash-pit is a vertical cooler, 2 feet in diameter and 18 feet high, the generator gas being drawn through its 30 tubes by a No. 3 Root's exhauster, the office of the cooler being to reduce the temperature of the generator gas made during the blasting period to 500 to 600 degrees. In this manner the injurious effects upon the exhauster of sudden and great fluctuations in temperature are avoided. The water in the cooler is used to feed the boilers, so that the heat is not wasted. The rest of the plant consists of a Heine boiler, set to be run with generator gas, which furnishes steam for two 9 x 12 engines, made by the Phoenix Iron Works, to drive the four exhausters, one engine being used for the day turn, and the other for the night shift. There was being built, too, at the time of our visit a set of retorts of special design for manufacturing illuminating gas with the water gas as a basis, the foundations for the purifier being completed while the last touches were being put to two holders, one of 20,000 cubic feet capacity for water gas, and one of 30,000 cubic feet capacity to be used for illuminating gas. Now it is being employed to measure the quantity of generator gas consumed and made. We may mention that the company have laid over a mile of pipe in the village of Tacony, and that a number of houses have their connections completed for fuel gas. The company have fitted up a room with stoves, lamps, &c., to show the domestic applications of the gas.

Turning now to the results obtained, it is stated that the relative proportions of generator and water gas show a production of 130,000 to 140,000 cubic feet of the former and from 40,000 to 50,000 cubic feet of the latter, according to the character of the coal used. Any kind of bituminous or semi-bituminous slack coal may be employed. So far as the employment of anthracite culm is concerned, we are advised that since the Tacony plant was built specially for bituminous coal it has not been determined how far it is possible to go with it as a part of the mixture. Thus far the maximum has been two-thirds of anthracite culm and one-third of bituminous coal. The 6-foot generators at Tacony each have a capacity for gasifying 8 tons of coal per 24 hours, and it is estimated that the size now contemplated for subsequent plants, 7 foot diameter of fire-box, will convert 10 tons daily into gas. When running on generator gas alone as large an amount of steam is introduced into the generator as is consistent with a continuous run, so that the product is a

gas which practically is intermediate between the ordinary Siemens producer gas and pure water gas. The Tacony plant, which was built under the supervision of Mr. S. T. Williams, general manager of the steel works of Messrs. Disston & Sons, has been used for some time past to test the value of fuel gas in its application to the different departments of these works.

At the time of our visit the striking differences in the convenience of using solid and gaseous fuel were well illustrated in the forge and hardening shops of the works. In the file forging shop a number of the gas and coal forges were at work, though the latter are being taken out as rapidly as possible. The contrast in cleanliness, ease of supervision, comfort to the men and uniformity of heating was remarkable, and even though the comparative cost has not yet been ascertained, these incidental important advantages would insure the employment of gas even if there were a balance against it. In the saw hardening department one furnace has been remodeled to use gas, and others are following. There, too, the same features are striking, being coupled besides with a decided gain in the amount of work one man can do and with the advantage that the entire handling of coal and of ashes is dispensed with, and that it becomes possible to economize considerably in floor space. For some time past Loomis generator gas has been used in a Siemens reheating furnace with a 7 x 12 foot hearth, used in connection with an 18-inch bar mill. According to the superintendent, its superiority over ordinary Siemens producer gas has been well shown in the smaller consumption of gas and in the more rapid and better working of the furnace. Permanent connections are now being made with the main mill, and within a week fuel gas will be used exclusively. Gas flues are being laid to connect with all boilers in the steel works, and in a few weeks they, too, will be fired with generator gas. Thus far the latter only has been employed. Later on a practical demonstration is to be made with the use of pure water gas in a Siemens furnace. It is claimed that the saving of labor in running these Loomis generators on generator gas over the Siemens producers is very large, one man doing the work of three; and the gas is made under pressure and can be carried to any number of furnaces, direct, without use of stack draft and the flow regulated perfectly.

Southern Pig Iron Freights.—The Southern Railway and Steamship Association, under date of the 18th inst., have issued a new schedule of freight rates, to take effect on October 1st, the following being the principal rates, all per ton of 2268 pounds:

	Birmingham.	Chattanooga.	Sheffield and Florence.
Chicago, Detroit, Hegewisch, Grand Crossing, Peoria, Pullman, South Bend.....	\$4.15	\$3.90	\$3.90
Allegheny, Bellaire, Pittsburgh, Steubenville, Wheeling.....	4.80	4.30	4.55
Cincinnati.....	2.90	2.40	2.65
Columbus, Dayton.....	3.65	3.15	3.40
East St. Louis, Belleville, St. Louis.....	3.40	3.15	2.95
Indianapolis, Terre Haute.....	3.40	3.15	3.15
Kansas City, Leavenworth, St. Joseph, Atchison.....	5.98	5.98	5.53
Louisville, East Cairo.....	2.65	2.40	2.40
Springfield, Ill., Bloomington.....	4.40	4.15	4.15

The Queen and Crescent route have issued a circular announcing an advance of 15 cents a ton over their tariff No. 7, dated August 1, 1888, to go into effect October 1.

New Steam Drop Press.

We illustrate on this page a drop press recently built by the E. W. Bliss Company, of Brooklyn, N. Y., for heavy stamping purposes. The requirements of the case for which it was designed called for a hammer, which, together with the soft metal force to be attached, should weigh 6000 pounds, and that a clear space of 48 inches between guides should be had. The excessive weight to be lifted rendered the

forged iron hammer head. The piston has two grooves turned into it, in which are inserted four tool steel packing rings, as rings made of any other material would not stand the jar to which they are subjected. The piston, piston-rod and hammer weigh together 3000 pounds, and in operation an additional weight of 3000 pounds of soft metal may be attached. The port at the upper end of the cylinder enters 4 inches below the head, leaving this amount of space for cushioning on the up stroke.

per cent. of the initial steam pressure. By this back pressure not only is the piston greatly retarded in its upward stroke, but, when cushioning occurs, it commences upon nearly full steam pressure, instead of upon atmospheric, and a leak would need be very serious and the upward tendency of the piston very persistent to neutralize this powerful persuader against further motion. When the valve is reversed, so as to exhaust the steam below and allow the hammer to fall freely, the upper port is open its full area and escaping steam enters from below the upper end of the cylinder.

The housings, which carry the cylinder and furnish a guide for the hammer, are secured to the bed by four bolts passing down through the bed to pockets, in which are the nuts, kept from jarring loose by rubber washers. The screws, by means of which they are adjusted laterally, to compensate for wear on the hammer, pass through wrought-iron poppets, let into the bed in the same manner as the four poppet screws shown in the cut for holding the die. The cylinder is secured to the housings in a similar manner. In order to prevent the hammer from descending when steam is turned off a latch is provided in the right-hand housing, as shown, which is so connected with the hand lever, which operates the valve, as to be moved out of the way when the hammer is allowed to fall. When steam is on no such support is necessary. The other general details are: Extreme width of bed, 7½ feet; weight of bed, 25,000 pounds; width between housings, 48 inches; extreme height, 12 feet. Total weight, 45,000 pounds.

The Forty-Mile Limit for Pittsburgh Coal.—Several months ago the different railroads leading from Pittsburgh agreed to a rate of 90 cents per ton on all coal shipped within a radius of 40 miles of Pittsburgh to the lake ports. For some time past the Pittsburgh operators have claimed that firms outside the 40-mile limit are securing the benefits of the 90-cent rate, and these, it is said, can have coal mined at from 25 to 30 cents per ton cheaper than operators nearer Pittsburgh. At the last meeting of the Pittsburgh Railroad Coal Association a committee was appointed to protest against the abuse. The new scale of 79 cents per ton to be paid the miners goes into effect November 1, as per agreement of the Interstate convention of miners and operators held in this city the first of the year. It will be an advance of 5 cents per ton over the present rate.

A press dispatch dated St. Louis, September 18, reads as follows: On October 1 a general strike of the coal miners in the St. Louis district will be inaugurated, and unless the operators back down from the position taken to-day, 40 mines will be shut down. All the mines are located in Illinois, and Belleville is the center of the district. The mines are nearly all controlled by a trust called the Consolidated Coal Company. At a convention of the miners held Saturday, in East St. Louis, a demand for an advance of ¼ cent per bushel was made. This meant an increase of 50 cents a day. To-day a committee waited on the trust, presented the demand, and met with a flat refusal. Then the committee gave notice of the strike.

Ground was broken in Pullman, Ill., on the 18th inst., for the construction of the Pullman electric railway. A complete circuit of the town will be made. The Van de Poel system will be used. The cars will be of the finest pattern made by the Pullman Palace Car Company. They will be about 30 feet long, and will contain smoking rooms, toilet apartments and other conveniences.

NEW STEAM DROP PRESS, BUILT BY THE E. W. BLISS COMPANY, BROOKLYN, N. Y.

use of any of the mechanical appliances ordinarily used for the purpose of catching the rebound and lifting the hammer too uncertain and too easily subject to derangement from constant shock to be considered available and recourse was had to direct steam pressure.

The cylinder at the top is 16 inches bore by 24 inches effective stroke and is single acting. Steam is admitted at the lower end for lifting the hammer, but there is no pressure on top of the piston, except back pressure from the exhaust for the purpose of cushioning, as will be explained. The piston and piston-rod are forged from a single steel billet and the lower end of the rod, which is 7 inches in diameter, is turned slightly tapered and keyed into the

As the machine is operated with 100 pounds of steam, it was thought necessary to provide additional security against striking the head, especially as when the rings became a little leaky (and in this class of machinery it is impossible to keep it absolutely tight) the cushion pressure would be lost to some extent. To accomplish this the valve, which is of the piston type, and also fitted with tool steel packing rings, is so arranged that when steam is admitted to lift the piston the upper end of the cylinder is open to the exhaust through a port opening of only one one-thousandth of the area of the piston. This creates a back pressure on the up stroke which, when the piston reaches the point of passing the port, amounts to about 80

The Snow Belt Fastener.

We show on this page several modifications of a belt fastener, known as the Snow fastener, and put on the market by the Common Sense Belt Fastener Company, 176 Superior street, Cleveland, Ohio. The principle of the device is at once apparent from the engravings and requires little explanation.

Fig. 1 shows the simplest form, the pegs being driven through the ends of the belt, these being put on a block and clinched. By using a wooden block all danger of breaking the fiber of the belt is avoided. Fig. 2 represents a detachable tooth fastener made of Bessemer steel. The plate is case hardened so as not to bend or bruise in removing the teeth, the latter being annealed to bend and not break. The teeth are adjusted to the plate and riveted with a rivet punch or hammer, requiring only a slight head so as to be easily driven out with a steel punch. For light single belts single teeth fasteners are recommended, while for heavy or

payment of damages. The *Ætna* Iron and Steel Works, however, have a charter of incorporation under that name, while Clark, Raffer & Co. were not incorporated under the name *Ætna* Iron Works, but merely adopted that to designate their establishment. The conflicting claims arising under this peculiar complication of affairs will give the courts a little trouble to solve, with exact justice to the interests involved.

Chicago Interstate Industrial Exposition.

The entries at the Chicago Exposition this year are not so rich in machinery and mechanical appliances as those of previous years. A few machines are shown in motion, but the great bulk of the exhibitors evidently preferred to make a display of actual products rather than illustrate how they were made. It is a rich collection, however, in almost every line of mechanical industry, comparing very favorably in that respect with its predecessors, and de-

effective manner in which they have been displayed to attract attention.

Brown Bros. Mfg. Company, of Waterbury, Conn., have a unique exhibit of vault and sidewalk lights. In the center of their section they have placed a framework of iron, 12 feet square and 2 feet high, studded with sidewalk lights. On this as a pedestal they have placed a pyramid of iron framework, about 4 feet high, with its faces also composed of sidewalk lights. Samples of vault covers, coal-hole covers and similar work are grouped about the central attraction.

Schenck's Adjustable Fireback Company, Chicago, Ill., have a large display of Westphal's revolving screw, bolt and shot cases, and revolving self-draining flower stands. These are shown in a number of sizes, and form a very striking exhibit.

The American Well Works, Aurora, Ill., have a well rig in place to show their method of sinking wells. They also exhibit samples of their well-boring appliances. A windmill of their latest pattern is a conspicuous part of the display.

Fig. 2.—Detachable Tooth Fastener.

Fig. 1.—Common Sense Fastener.

Fig. 3.—Steel Belt Coupling.

THE SNOW BELT FASTENERS, MADE BY THE COMMON SENSE BELT FASTENER CO., CLEVELAND, OHIO.

double leather belts two rows of teeth or double fasteners are desirable.

In Fig. 3 we show a coupling of special type applied to one end of a double thickness belt. The method of application is similar to that used in connection with the fastening illustrated in Fig. 2, hook rivets, however, being employed. In using this coupling the pegs of the belt are opened with a suitable tool, and the fastener plate is inserted to the proper depth. Points are then marked and holes punctured with a pegging awl. The hook rivets are then driven and clinched as already described.

Clark, Raffer & Co., of Chicago, who have for many years conducted an architectural iron business under the name of the *Ætna* Iron Works, have filed a bill against J. Louis Pfau of the same city, manager and secretary of the *Ætna* Iron and Steel Works, organized in 1886 to engage in a similar class of work. The complainants claim that the latter company, through the name they have adopted, have been receiving orders intended for the former, and that their business is thus being seriously interfered with. The court is asked to restrain the defendants from using a name so similar to that under which the complainants have long been known, and to compel an accounting and

monstrating the possibility of keeping up an attractive array of exhibits from year to year.

The Iowa Farming Tool Company, Fort Madison, Iowa, have made a very satisfactory showing of their line of farm tools. In the center of their space they have erected a pyramid 8 feet square at the base and 30 feet high, which is covered with red cloth and hung from top to bottom with fancifully arranged samples of their hoes, forks, grain cradles, ox-bows, &c. A very handsome specimen of their tool rack, for use in displaying samples in stores, occupies a conspicuous position as part of the exhibit.

The Wheeler Reflector Company, Boston, Mass., have a neatly arranged pavilion hung with various kinds of lamps to show the different styles of reflectors manufactured by them. From the ceiling are suspended large reflectors with glass pendants, while the walls are filled with a great variety of lamps and reflectors intended for almost every use.

The Meriden Britannia Company, Meriden, Conn., have a very handsome pavilion, with a blue arched roof, black and gold posts, large plate glass windows, covering every side, and polished Tennessee marble panels in the base. The specimens of their work shown embrace the most artistic specimens of table-ware, worthy of the very

The water used in the Exposition Building is all filtered in an enormous filter erected by the American Filter Company. The feed-water for the exposition boilers is heated to 210° F by the Miller heater and purifier furnished by the same company.

Small electric motors are displayed by the Belding Electric Motor and Mfg. Company, of Chicago, and the C. & C. Electric Motor Company, of New York. The Belding Company have a number of their motors operating fans, sewing machines, &c., as a special exhibit. The motors shown range from $\frac{1}{4}$ to 1 horse-power. The C. & C. Company have their motors distributed among the operators on sewing machines engaged in turning out fancy work in several pavilions.

The Chapman Valve Mfg. Company, Indian Orchard, Mass., make a decidedly attractive display of their valves. They have them handsomely painted, and the central feature of the section is a stand having four semi-circular shelves, tapering in size from the bottom to the top, each filled with valves of corresponding size. Groups of valves of various patterns are placed around the base of the stand.

The Machinists' Supply Company, Chicago, have an entire section filled with lathes, drills, portable forges, and show cases with small tools under cover.

Borden, Selleck & Co., of Chicago, exhibit one of Harrison's conveyers for automatically handling coal, ore, grain, &c.

F. Hainsworth & Son, proprietors of the Unique Wrought-Iron Works, show a large number of samples of ornamental railing of peculiar pattern manufactured under their patents. A great deal of the iron is crimped throughout, even the small circles, scrolls and bends being formed of crimped strip iron. Their work also comprises frames for grates, grate guards and irons, ornamental arbors and other articles in highly ornamental designs.

The F. P. Smith Wire and Iron Works exhibit a great variety of wire goods, illustrating the almost endless uses to which wire can be adapted in the hands of the ingenious workman.

The Expanded Metal Company, of Chicago, make a good display of their special product. They have inclosed their space with a fence and gates made of expanded metal and have hung in a conspicuous position a card bearing in large letters the notice: "This is not wire." In addition to fencing they exhibit arbors, tree boxes, mats, lawn furniture, &c., made of their metal.

The exhibit of the Marinette Iron Works Company, Marinette, Wis., is quite extensive, as their line embraces such a variety of articles. Among other things shown by them are the Hutson Giant Fire King, which is a one-man chemical engine, mounted on two wheels, with hose reel, &c., complete; the Michigan Lubricator Company's improved sight feed lubricator; the Montgomery automatic and compound grease cup; Brock's patent chain-pipe wrench; the Penberthy improved automatic injector; brass and iron valves, pipe fittings, &c.

The Nye Steam Vacuum Pump Company, of Chicago, exhibit a large number of their pumps, intended for mining, irrigation and wrecking purposes, and for pumping sand and gravel. Some of them are shown in active operation, discharging immense quantities of water and demonstrating their undoubted efficiency.

The steam engines used in operating the machinery of the Exposition, running electric lights dynamos, &c., are the Buckeye and the Russell engines.

The Union Indurated Fibre Company, New York, make a very fine exhibit of the ware manufactured by them from wood fibre. Pails, liquid and dry measures, wash-basins, water-coolers, tubs, keelers, milk pans, &c., are shown in great variety, and they are arranged in a way to attract the notice and excite the interest of those who come within range of it. The remarks made by visitors concerning it show that this ware is still a matter of great curiosity to a considerable portion of the population of the country.

Exhibitors of other goods of interest to our readers are as follows: David Bradley Mfg. Company, agricultural implements; Clive Mfg. Company, hardware specialties; Cornell Engine Company, gas engines; Clinton Wire Cloth Company, Clinton, Mass., wire cloth; Chemical Fire Extinguisher Company; Corrugated Elbow Company, Cincinnati, Ohio, stove pipe; Copeland Engine Company, Camden, N. J.; Harden Hand Grenade and Fire Extinguisher Company, New York; Charles Kaestner & Co., Chicago, brick machinery; C. Sidney Shepard & Company, Buffalo, N. Y., tinware; Jenney & Graham Gun Company, guns. Stoves are also well represented by a number of the leading manufacturers.

The fifty-second meeting of the American Institute of Mining Engineers will be held at Buffalo, N. Y., beginning on Tuesday evening, October 2, 1888. Dr. Julius Pohlman, director of the Museum of the Society of Natural Sciences, is

secretary of the Local Committee, and correspondence concerning the local arrangements, hotel accommodations, &c., should be addressed to him.

The Disston Steel Works.

Operations are being actively pushed to rebuild that portion of the steel works—a part of the file and saw manufacturing plant—of Disston & Co. which was destroyed by fire some time since. The crucible steel department and the sheet rolling mill was the property partly destroyed by the fire. The disaster has been seized as the opportunity for extensions and improvements. The height of the building has been increased by 8 feet, and the Scheffler Bridge Works are completing a handsome iron roof of two spans, one 105 feet and the other 93 feet 10 inches, the former being over the rolling department. The new building is 198 feet 10 inches wide by 305 feet long. The crucible steel works have three 24-pot furnaces, while the sheet-rolling department contains four trains. The 28-inch plate train is driven by a 28 x 80 inch I. P. Morris engine, while a 22 x 48 inch engine from the same maker drives one of the two 16-inch trains of the mill. The second 16-inch and a 20-inch train are driven by a vertical 28 x

Mold for Solid Steel Ingots.

44 inch engine. A good deal of this machinery suffered heavily from the fire, and important parts of it had to be rebuilt. The mill is equipped with the necessary complement of shears and punches, and the heating furnaces, whose waste heat is utilized by Haselton boilers. In addition to them a 600 horse-power Heine boiler is being put in.

The bar mill is a later enterprise of the Disstons. It contains an 18-inch mill, three-high, with five stands of rolls, and a 9-inch train, just completed; also with five stands of rolls. Each of these is driven direct by a separate Porter-Allen engine. Steam is furnished by two batteries of 300 horse-power Heine boilers. This mill, being covered with an iron roof, was not injured by the fire. At the time of our visit one train of rolls in the sheet mill and two melting furnaces were running under temporary roofs, and in a few weeks the largely remodeled mill will be in operation.

A new water works is also being erected at Tacony, the plant consisting of a compound condensing Worthington pump of 2,000,000 gallons capacity, to supply both the factory and the village with water.

From a technical point of view, one of the most interesting features in connection with the Disston Steel Works is

THE WILLIAMS PROCESS OF MAKING SOLID INGOTS,

which has been in use for a considerable period. The process was patented by Mr. S. T. Williams, on December 8, 1885, and at the time of the fire 19 presses were in operation, while 12 more were being built, the percentage of split saws having been reduced to a minimum as the result of

their use. Piped saw plate ingots rolled into saw plate and manufactured into saws do not show their defects until the last stages of manufacturing large circular saws are reached, the unsound ingot showing its defect in the splitting of the saw plate. The loss, of course, is heavy, since the final stage of manufacture is reached before the defect is detected, and the article must wander into the scrap heap. Mr. Williams casts the steel into a mold hollowed out in the manner shown in the accompanying illustration.

Into a mold of the above character the melted metal is poured, and as quickly as possible thereafter a hot cover or plug, *c*, is placed on the top of it. The cover may be made of any suitable material; but a refractory material is the best. The cover is either put on in such a position as to leave a small space between it and the metal in the central portion of the top of the casting, or the bottom of the cover may be hollowed or dished out to form a cavity, as may be deemed best in practice. As soon as the metal in the mold has set sufficiently to hold the molecules together, the mold is opened on the side or sides next to the belly or bellies (for the mold may be hollowed out on both sides instead of one only), and a pressure-plate is inserted with its flat side against the belly and its convex side opposite the hollowed-out portion of the mold, and the hollowed-out portion of the mold put in plane and pressure applied. The metal composing the belly portion of the ingot is thus forced inwardly, and the more movable portion of the ingot located at its central part is thereby forced upwardly or outwardly into the space or chamber beneath the hot cover, filling the same, and thus forming a head of metal kept in a soft or liquid form by the heated cover, and ready to feed into any pipe or cavity which may form in the ingot as it cools. After sufficient pressure has been applied to fill the head cavity the pressure is more gently continued for some minutes, to hold the metal well together, in order to prevent the pipe or cavity which is being fed from the head from becoming any larger than can be avoided.

The pressure-plate, it will be observed, is constructed with one side convex and the other plane. The convex side is preferably of such shape and size as to just fill the hollowed-out portion of the mold, and the ingot, when cooled, will thus have a plane face on the side where it originally bulged out; or, if it is not necessary that the ingot should have a plane surface, an ordinary plane-faced mold can be advantageously employed and the pressure-plate inserted with its convex side toward the ingot. The head for supplying the pipe is kept hot by the hot cover and remains in a liquid state sufficiently long to feed the pipe until the metal ingot has become cooled and set to the very top. It is the better plan to put a slight pressure on the top of the plug to hold it in place; but this is not necessary if the pressure on the pressure-plate be applied very evenly and gently.

The pressure is applied with the aid of a hydraulic press of special design. We are informed that the result of the introduction of the method has been not only to avoid the dangers growing out of piped ingots, already alluded to, but that the quantity of steel cut from the heads of ingots has been reduced to 5 per cent., or practically to what is needed to trim them before rolling.

The Ontario Mining Commission, during a recent tour on the north shore of Georgian Bay, discovered mines represented to be very rich in copper and nickel; and, 80 miles west of Port Arthur, is an iron district which promises to be among the richest in America.

Those Exported Boiler Tubes.

Some time since considerable capital was made out of the fact that a Boston boiler tube maker had exported a small lot of boiler tubes for one of the foreign manufacturing of the Babcock & Wilcox Company. Writing from Haarlem, Holland, Mr. George H. Babcock, of the firm, gives the facts and comments on them in a letter, from which we quote the following:

I was surprised to see that that transaction was instanced as an evidence that the American system of protection to home industry was a failure and that the boiler tube manufacturers would be better off under free trade. Now, while boiler tubes are our "raw material," and, in common with other manufacturers, it would be for our interest to have our raw material duty free, provided the duty was retained upon boilers, our manufactured product, yet I fail to see how the fact quoted is evidence of the approach of that desired condition. It is true that we did order a bill of steel boiler tubes to be shipped from Boston and delivered at a slightly less price than we could buy the same quality of tubes in Glasgow. But this is not so strange when we consider that the price in Glasgow is abnormally high, owing to a combination among manufacturers, and represents a very large profit on the cost of production.

The Boston house, getting its stock at foreign prices, plus 10 per cent. duty, found it could in this case afford to realize enough less profit than the foreign manufacturers were demanding to balance the extra cost of labor, duty on material and freight. Were the makers of Scotch tubes so disposed they could undersell the price paid the Boston house by probably 40 per cent. and still make as much profit as the Boston makers did on this transaction. In proof of this we are buying in Glasgow certain tubes which do not come into the combination rates at prices which would soon bankrupt any American manufacturer.

I note your remark that "without the 45 per cent. that must be paid on the same steel when used for goods sold in this country they could be sold so much cheaper here, the quantity made would increase, more labor would be employed, and every one would be benefited—in short, the exactly opposite effect would be secured from that produced by a 'protective tariff.'" That is, assuming the duty to be taken off the "steel skelps," the tubemakers' "raw material," and retained on the tubes, his "finished product." The same might be true, possibly, of every manufacturer, provided it did not at the same time act reversely and to a counterbalancing extent on some other product. In the case supposed, would not the labor thrown out of use in providing the "skelps" more than equal any additional labor employed in making more tubes? But the steel rolling mills thus stopped would decrease the demand for boilers and boiler tubes, and so would there not be fewer made rather than more? and so labor would suffer while no one is benefited.

My experience of 20 years shows that that amount of reduction would not cause any perceptible increase in the demand either for tubes or boilers. The Babcock & Wilcox Company are probably the largest user of boiler tubes in the world. Their sales in June last alone in Europe and America required the use of 1,000,000 feet of 4-inch tubes. These we buy in the United States, Scotland, Germany and France, as we have occasion, and, of course, buy as cheaply as anybody. Now, though the American maker pays twice as much for his labor and much more for his material, he sells within 10 to 20 per cent. of the price in free trade countries, notwithstanding the fact that he is "protected"

by a tariff amounting to about 100 per cent. on the cost of production. This means that he makes less profits than the man who manufactures under free trade, while the entire benefit of "protection" is reaped by the laborer. It means another thing also—that there is no truth in the often-repeated statement that a tariff increases the cost to the consumer equal to the amount of the duty. Tubes have been sold in New York within the last five years at a price less than the amount of the duty on the same tubes if imported, and they can be bought to-day at a small advance upon that figure. The effect "produced by a protective tariff" is "the exact opposite" of that commonly attributed to it by the advocates of free trade or a "tariff for revenue only." It seems, in practice, to reduce the cost to the consumer of most articles of necessity, and many of luxury, while it enhances the rewards of labor and reduces the profits of manufacture.

The New Edgar Thomson Rail Train.

Since the completion of the new rail train, the Edgar Thomson Steel Works, Braddock, has become the Mecca of rolling-mill men. Lately a representative of *The Iron Age* paid a hasty visit to that plant, which served to give at least a general impression of its features. From the old blooming train, with its adjacent bloom chipping hammer, the blooms are delivered on a series of driven rollers, which, arranged on a curve, carry it to what may be termed a switch. They then reach a car running on a track back of the long line of reheating furnaces, of which there are five, each with nine working doors. By an endless iron rope wound on a drum driven by a small special engine the car may be delivered in front of any one charging door of the series. Every furnace has a pusher, which delivers the bloom into the heating furnace. In front of the heating furnace is a similar arrangement for drawing the heated blooms. A special engine runs an endless wire rope, to which is attached a car. Upon the latter the drawing apparatus, with an ingenious grip, deposits the bloom. The latter is conveyed to the driven rolls, which run the bloom upon the table of the first train.

Practically Capt. W. R. Jones has divided the ordinary three-high rail train into three, the first five passes being made in one train, the second five in a second train to which the first delivers directly, and the last finishing pass being made in a third train. A crane commands the latter, so that the finishing rolls can be rapidly changed. Each train is driven by its own independent engine, and is practically automatic, one man handling the levers which lift the tables, turn the bloomer, &c. From the table of the first train the billet goes to the second; from there by driven rollers to the finishing train. From the latter the rail is carried along by driven rollers to the hot saws, the metal traveling in all these operations along the axis of one long building. The hot beds are located in a wing at right angles to it, and then are taken back in the direction of their length into the drilling and pressing building, which is parallel to the rolling mill building, they traveling then in a direction opposite to that in the latter. The finished rails are pushed sideways out of this building to the cars on which they are shipped. The boiler house has two batteries of 12 boilers each, and we noticed particularly that along one entire side of the rolling mill proper is a bench upon which lie the rolls. The whole arrangement is a radical departure from all former types, and it needs only a glance at the never ceasing procession of blooms entering at one end and of finished rails passing the saws to appreciate the

enormous capacity of the plant. It is rated at 1000 tons of finished rails a day. Its record even now is 962 tons, and there is probably no exaggeration in the remark made by the engineer of one of the leading Eastern mills whom we happened to meet just after he had, for the first time, seen the plant, that it would not be a matter of surprise to him if the new mill would arrive at a record of 1500 tons a day. The mill is certainly an enormous stride in advance, and being practically automatic would seem to represent the possible climax of labor-saving in that direction. The impression is created by an inspection of it that this new rail mill overbalances in capacity the other parts of the plant, that one or more new blast furnaces, an enlargement of the Bessemer steel department, and notably an addition to the blooming capacity would become necessary in the not distant future. We repeat that this is merely an impression, and that the idea is thrown out without any accurate knowledge of the relative capacity of the different parts of the plant.

Few charges have been made in the other departments. At the blast furnaces one metal mixer is in use and a second one is being built. On both sides of the Bessemer steel works a hydraulic pusher has been put up, to push the ingots out of the molds, no effort being now made to strip in the pit.

Industrial Jubilee at Louisville.

On the 5th inst. the people of Louisville held a grand demonstration to commemorate the industrial and commercial progress made by the city within the past decade. The business of the city and its enterprising suburbs has grown so rapidly of late years that the citizens may well take pride in the success of their endeavors to put the metropolis of Kentucky high on the roll of the progressive cities of the country. To emphasize the forward movement they have made, and to let the outside world understand something of its importance, this industrial jubilee was planned by the citizens who have taken the most active interest in stimulating the city's growth in manufacturing industries. The active agencies with which they are identified are the Commercial Club and the Board of Trade. These bodies have done so much toward building up the trade of Louisville that they can properly be mentioned as examples of energy and enterprise worthy of emulation by similar organizations in other cities. The growth of Louisville's business is shown by the last annual report of the Commercial Club, which enumerates 65 manufacturing establishments, 27 wholesale commercial houses, and 291 retail commercial establishments added to the business interests of the city in the previous 12 months. Quite a number of these are directly traceable to the influence of the two organizations mentioned. Since 1880 the annual volume of business is estimated to have increased \$150,000,000.

The industrial demonstration which took place on the 5th inst. is reported by observers to have been a magnificent spectacle, far superior to the usual advertising pageants which so often masquerade under that name. The various business interests of the city entered with spirit into the proper observance of the real purpose of the display, and originality was manifested with most striking effect where it was least expected. The Louisville dailies, particularly the *Courier-Journal*, contained glowing reports on the following day of the magnificent success which had been scored by those who originated and managed the great jubilee. Special editions were issued, calling the attention of visitors and of the outside world to the advantages of Louisville, and to the great natural wealth

of the State of Kentucky to which it virtually holds the key. The success of this celebration will stimulate the efforts of the business men of Louisville still further to push forward their plans for greater growth and wider influence, even though it may not directly attract capital and increase investments.

The manufacturers of Louisville anticipate a decided increase in the business of their city with the advent of cheap fuel, which is promised by the projectors of natural gas-pipe lines from wells in Meade County, 25 miles southwest of Louisville in an air line, but 30 miles distant by the route surveyed. The wells now flowing produce 16,000,000 feet of gas daily, and the supply can be largely increased whenever it is demanded. It is announced that one company has already arranged to lay pipes between its wells and the city, making its operations an assured fact. The supply of natural gas at low cost in unlimited quantity would be a great boon to Louisville, although it is located within easy reach of Kentucky coal fields, and also receives large supplies of coal from the upper courses of the Ohio River. With such a fuel Louisville would take greater strides than ever toward industrial greatness, and its jubilees of future years would totally eclipse the glory of the recent celebration.

Notes from Providence, R. I.

Charles Frederick Herreshoff, whose funeral took place in Bristol recently, was father of one of the best known families in Rhode Island. The late octogenarian was born in Providence and removed to Bristol from the old farm in 1856. A graduate of Brown University, he was, with the exception of Bishop Howe, the only survivor of the class of 1828. He was deeply interested in boats and boating—a characteristic that was inherited by two of his sons, John B. and Nathaniel G. of the Herreshoff Mfg. Company, which has given Bristol celebrity as the town which furnishes the best and fastest steamers in the world. When the Company was in its early days the deceased helped model some of the fastest boats built at the Herreshoff shipyard, and in connection with the death of this well-known citizen a short account of the industry bearing his name may be of interest.

The president of the company, John B. Herreshoff, is one of the remarkable men of the country. For years he has been blind, but the misfortune of loss of sight has not impaired his capacity for practical work, and as president and treasurer of the company he is as active and efficient as though he has the keenest eyes. An instance of this was recently mentioned in the *New York Sun*. About ten years ago he received a telegram from one of the South American consuls in New York, asking him to come to his office down town at a certain hour. He went and found several representatives of the South American Government. They wanted three torpedo boats of a novel design built, and they wanted them built in sections, so that they could be shipped to their destination and there put together. They wanted several odd conditions in the boats, and then they wanted to know for how much Herreshoff would build them.

"I must have time to think it over," he said.

"How long a time?"

"Oh, 20 minutes."

Twenty minutes for a blind man to consider the plans and specifications for these torpedo boats—to consider them without pencil or paper—to perform roll them over carefully and minutely in his head! But he did it. In 20 minutes he had made a mental estimate of what they would cost;

he got the contract, and they were at a specified time packed and ready for shipment. That was a remarkable incident, but John Herreshoff is a remarkable man, and he has built some remarkable boats.

The Herreshoff children took to boats, and it isn't strange, therefore, that John Herreshoff began whittling out boats as soon as he was old enough to manage a jack knife. In his fifteenth year he built a good sized craft for sailing on the bay. About this time he lost his sight; gradually a film came over his eyes, but he went on building boats just the same, but instead of studying the grace and strength of lines by his eye, the matter became to Herreshoff at once a more abstract study, a mental calculation. He had the task before him of carrying in his mind the models he worked upon. The objects he had seen with his eyes in the first 15 years of his life he could summon up into his mind again. Under the enforced habit of mental activity, without the interruption and suggestion of outside objects, his mind grew to be one of remarkable concentration and acuteness. He became able, for instance, to set up before himself, from a careful description, a piece of machinery, and to explain its workings and its faults. His sense of touch developed to a wonderful sensitiveness, too. He learned to recognize the power of lines by rubbing his fingers slowly over them, and how well he succeeded in finding the good and discarding the bad has been shown by many a craft built in the early days of his business, which made a record on the Narragansett like the old *Qui Vive*, for several years the fastest boat on the coast, and the *Sadie*, a 52-foot sloop, which was sold to Mr. Burgess.

But this was when Herreshoff was building only sailing vessels. It was not until after 1873, when Nathaniel Herreshoff became interested with his brother, that the Herreshoff steam vessels made their appearance. Mr. John Herreshoff had been thinking over the coil boiler idea for some time, and when it was applied to steam craft it was so successful that the building of sailing vessels was at once abandoned. The industry at once jumped into prominence, and the shops were used for making every part of the vessel. John B. Herreshoff became the president and treasurer of the company, Nathaniel Herreshoff the general superintendent and designer, Charles Young the secretary, and Albert Almy chief of construction.

There is no doubt that in the public mind there is a partial misapprehension of the part the third Herreshoff takes in the construction of boats in the shops of the company. The average individual who has heard of Herreshoff would very likely expect to find him industriously at work upon a model or laying down the lines in some ingenious way for a new boat. But there are a big boiler shop, engine shop, boat shop, repairing shop and docks, all with their quota of men, whom John B. Herreshoff, as the president and head of the company, controls.

Mr. Nathaniel G. Herreshoff, who is not blind, like John and others in his family, is the designer. He works out the models, makes the calculations, &c.

The Narragansett Electric Lighting Company have begun the construction of a new station at the foot of Elm street, on the river front, where a lot of land 200 x 300 feet, has been bought, with a wharf frontage of 200 feet. The contracts are not all concluded yet, but the foundations are in for the dynamo-room, 60 x 200 feet, a single-story structure, to be built of brick, with brown-stone trimmings and an iron roof. The pile foundations are also down for the (tack, which will be a 14-foot flue, octagon in section and 200 feet high. The boiler-room will be in a separate building, across a driveway, and coal

pockets will be built over the boiler-house, into which coal may be delivered from vessels with but a single handling. The premises are arranged so as to allow of duplication of both the power and dynamo houses if necessary, and the lot will afford opportunity for the establishment of one of the largest stations in the country.

The Armington & Sims Engine Company, of this city, are making a number of engines for the Navy Department, the engines to be coupled direct to the dynamo. But a small space is required for their double engine, and the weight of the whole plant is very moderate. The company report great success in the use of this engine.

The summer travel on all the railways reaching town has been noticeably heavy. The Old Colony trains have been run with full seats, and the August mileage on the New York, Providence and Boston Road was 7000 miles in excess of the record.

The new steel yacht *Valleymena*, building by the Herreshoff Mfg. Company for George S. Brown, of Baltimore, is receiving her machinery and will soon be launched. She is 148 feet in length, with an 18-foot breadth of beam and a 7-foot draft. Her engines, also built by the Herreshoffs, are of a quadruple expansion type and are beauties of simplicity and strength, capable of 800 horse-power. The woodwork is of highly polished quartered oak, and there are five water-tank bulkheads. She will cost Mr. Brown about \$70,000 as she comes from the Herreshoffs hands.

LEONIDAS.

Tests of Steel Eye-Bars.—The Edge Moor Iron Company have lately made a number of tests of steel eye-bars manufactured by Carnegie, Phipps & Co., of Pittsburgh. The diameter of the eye in all was 12½ inches, while the diameter of the pin-hole was 4.96 inches. The first two 15 feet long and the second two 18 feet:

	1.	2.	3.	4.
Per cent. excess, Eye A.....	59.6	56.8	56.1	62.5
Per cent. excess, Eye B.....	55.0	59.7	56.8	56.2
Size of bar.....	5 x 15-18	5 x 15½	5 x 15½	5 x 1
Length, back to back, of holes.....	ft. in. 16 11	ft. in. 16 11	ft. in. 20 11½	ft. in. 32 6¼
Elastic limit, pounds.....	36,520	36,700	36,740	39,550
Elongation of hole, A.....	0.35	0.54	0.75	0.74
Elongation of hole, B.....	0.40	0.76	0.56	0.57
Elongation 8 inches, per cent.....	41.2	39.2	39.6	37.5
Elongation total length, per cent.....	In 15 feet. 13.1	15.3	16.4	11.4
Reduction of area, per cent.....	51.5	49.0	46.7	43.3
Ultimate strength.....	64,030	64,680	66,140	63,700

The fracture of the first two eye-bars was capped and silky, while that of the second two was 45 per cent. silky. In the first the fracture took place 3 feet 11 inches from the back of pin-hole B; in the second, 3 feet 3 inches; in the third, 16½ inches from pin-hole A, and in the fourth, 2 feet 9¾ inches from pin-hole B.

The International Fair at Buffalo has given birth to an extraordinary newspaper sheet called the *Buffalo Express Extra*, comprising 60 pages, printed in a choice style of typography, and illustrating in its descriptions a large number of the business concerns in the city, stove manufacturers, engine builders, &c., as well as presenting photographic reproductions of a life-like character of several score of representative business men in all departments. Altogether, as a souvenir it is of no mean order, even in its historical features, which are duly set forth with maps, diagrams and reminiscences of early days, not omitting a portrait of Red Jacket, the Seneca Chief and orator.

Waterhouse Dynamo and Regulator.

In order to explain a new method of regulation in electric lighting for which patents have just been allowed, we illustrate on this page the system adopted by the Waterhouse Electric and Mfg. Company, of Hartford, Conn.

In Fig. 2 we show a Waterhouse dynamo with a closed circuit armature, A. On the commutator C are three brushes; *a* and *b* are the main circuit brushes and *c* the auxiliary brush. From the positive brush *a* the current passes to the conductor around the field magnets F to the resistance R. The current from the auxiliary brush *c* passes directly to the resistance R, leaving the field magnets out of circuit. The current from both circuits (field and local) joins at R and passes to the lamps, the current on the lamp line being the sum of the two. The amount of current in the field and local circuits is in proportion to the resistance R in each. The brushes have a fixed position.

There is in every dynamo a point of maximum commutation on the armature which changes with the resistance on the lamp line, moving with the rotation (toward brush *c*) when the resistance decreases and back when it increases. This affects the current in the local and field circuits as follows: When lights are turned out the line resistance is decreased and the maximum point moves forward and forces more current out of brush *c* and less out of brush *a*. This reduces the current in the field magnets and the E. M. F. in the circuit and consequently the power required to operate the dynamo. But the current on the lamp line remains constant, because the local circuit is increased proportional to the decrease of the field circuit. The remaining lamps therefore retain their full brilliancy, while the current cannot increase and destroy the apparatus. Thus the very tendency of the machine is to perfect regulation without the aid of a mechanism, but when to this is added the simple regulator, which makes the regulation instantaneous by assisting the current to pass out at brush *c* and opposing its passage around the field magnets by way of brush *a* when lights are cut out, and forcing it out at brush *a* around the field magnets by opposing its passage out at brush *c* when lights are put in the circuit, the efficiency of the method can be appreciated.

The regulator is illustrated by a slide in Fig. 2, controlled by a solenoid. Any tendency of the current to increase raises the contact, and the result is a decrease of resistance in the local circuit and an increase of the resistance in the field circuit. More current will therefore flow through the local circuit and less through the field circuit. The generating capacity of the dynamo is instantly reduced and any tendency to produce a current above the standard is overcome. Should the tendency of the current be to decrease, say by a reduction of the speed of the armature, the slide lowers, increasing the resistance in the local and reducing it in the field circuit. More current will then flow around the field magnets and less out on the local circuit. The generating capacity of the dynamo will therefore increase to maintain the current at standard. It should be stated that the use of resistance for balancing the field and local circuits is a small amount compared to that used by the lamps, and is not interposed, as can be seen, for the purpose of compensating for lamps turned off. The Waterhouse regulator varies the E. M. F. directly with the resistance of the lamp line, producing self-regulation and maintaining on the lamp line the standard current, whether one lamp or the full number are burning. By this method, as the lamps are cut out the

current is reduced in the dynamo. Fig. 1 represents the complete machine, to which this method of regulation is attached, and plants are manufactured from three arc lights and up. The light produced is very steady, and entirely satisfactory for inside or outside illumination, and it is now in

fastest vessel ever built by Cramps. Her hull is of beautiful design and all the power possible has been put in her. She is 246 feet long, 26 feet 5 inches beam, 14 feet deep; mean draft, 9 feet; displacement, 725 tons. Her motive power consists of two triple-expansion twin-

THE WATERHOUSE SYSTEM OF DYNAMO REGULATION.

use in a large number of the representative mills of the country.

The Dynamite Cruiser.—The dynamite cruiser Vesuvius is being finished, both below and on deck, and little remains to be done but to complete the apparatus for firing the pneumatic guns. The engines have been tested by dock trial and gave very satisfactory results at 220 revolutions per minute. This will doubtless be the

screw engines, developing about 3200 indicated horse-power. There are four cylinders to each engine, the high-pressure is 21½ inches diameter, the intermediate 31, and the two lower pressure cylinders 34 inches diameter. The engines are 20 inches stroke. There are four locomotive boilers 9 feet in diameter by 19½ feet long. They are to carry 160 pounds steam working pressure. The vessel is guaranteed to make at least 20 knots.

A Modern Boiler Works.

The boiler works of John Mohr & Son are located at 32 Illinois street, in the heart of a large manufacturing district of Chicago, and occupy a site having a front of 143 feet and a depth of 216 feet. Mr. Mohr, the senior partner, was formerly connected with the boiler department of other works, but withdrew in 1882 to operate independently. He has six sons, all of whom have been brought up in the boiler trade and who have charge of the several departments. At these works anything is built that can be made of plate iron and steel, but special attention is given to rolling-mill and blast-furnace work, and marine and general boiler work. Within the past year expensive machinery has been added, and further improvements are in progress.

Throughout the establishment the saving of labor is carefully studied. Heavy plates are carried from one part of the works to another either by overhead tramways or by elevators running between floors on different levels. As the plates are received they pass to the drillroom, then to the bending-room, next to the riveting-room, and finally to the finishing shop. The drillroom contains a number of the usual tools, but, in addition, there is a machine which will punch holes up to 6 inches in diameter through inch plate, or it can be used for punching holes of the smallest size. Power is furnished to operate the machinery in this and adjoining departments by a Corliss engine, 12 x 36 inches, built by the Weisel & Vilter Mfg. Company, of Milwaukee. From this engine rope transmission is used to convey power 83 feet distant to a shaft at the furthest end of the building in which it is situated. Six strands of 4-inch common manila rope are used. The rope, which is all one piece, runs noiselessly. The transmission plant was designed by T. S. Miller, of the Link Belt Machinery Company, Chicago. Iron sheaves are used.

In the bending-room are a set of rolls, a flue-welding machine and smiths' fires. The rolls, which were made by the Niles Tool Works, are claimed to be the heaviest in the country. The housings are massive; the upper roll is 24 inches in diameter and each of the two lower rolls measures 20 inches. The inside length of the rolls is 17 feet. An independent three-cylinder engine furnishes power. The flue-welding machine is intended to be used in welding short pieces of tube to the ends of tubes from which defective pieces have been cut, and does its work much better and more rapidly than it can be done by hand.

The riveting room is fitted up with a hydraulic riveting machine, built by Tweddell, of Gloucester, England. A tower, 52 feet high, extends above the riveter, in which boilers are raised and lowered vertically by hydraulic power, as well as moved laterally toward and from the machine, all operations being controlled by a workman standing on a platform by the side of the riveter. Rivets are heated in a furnace of original design, which will hold a keg at a time, heating them to a cherry red without danger of burning. The riveting machine exerts a pressure of 45 tons on the rivets and of 25 tons on the plates, forcing the latter together so closely that calking is practically superfluous. It is exceedingly interesting to watch a long boiler move vertically in front of this machine, which fastens rivets almost as rapidly as they can be put in place. A very slight pause is made after each one is flattened, sufficient to allow it to cool and retain its perfect set. The heads of boilers are riveted by hand, except when they are inserted reversed, in which case the flange is exposed and the hydraulic riveter can be used. In these works every hole in steel boilers is drilled, not punched.

The substitution of steel for iron in boiler-making is demonstrated very forcibly by the fact that in these works 99 out of every 100 boilers are made of steel. Otis steel is used unless other makes are specified by the purchasers.

The flanging-room contains a heating furnace and a flanging machine. The heating furnace is a reverberatory furnace large enough to hold a 12-foot plate. A buggy is used to convey the hot plates to the flanging machine. This machine will flange plates ranging from 24 inches to 8 feet in diameter, and was built by Joseph B. Blettnier, of Cincinnati. It is said to be the largest in the country. Flue holes are now flanged by hand, but a machine will shortly be in place for such work. A steam hammer is also to be added for forging irregular shapes. Among the new tools which have been ordered and will soon be set up in the works is an 18-foot plate planer being built by the Niles Tool Works.

The standard boiler made by Messrs. Mohr & Sons consists of two sheets only in the body. One sheet is used for the top and the other for the bottom, the lines of rivets running along the sides, so that no double thickness of plate is exposed to the fire. Very little work is done on boilers for stock, but nearly everything turned out is order work made under exact specifications. While a large part of their business is of local origin, the firm now enjoy a patronage extending from Pittsburgh to the Pacific coast, a great deal of boiler work now coming to Chicago from the far West which formerly went to other cities. Nearly \$200,000 have been invested in this plant up to the present, and from 150 to 175 men are regularly employed, who work up an average of 3000 tons of plates yearly.

The Sioux City Corn Palace.

Unique among the usual autumnal celebrations, expositions, &c., is the Corn Palace at Sioux City, Iowa, opened on the 24th inst., and to be closed on the 6th of October. In the building of the first annual corn palace last year no definite plan was adopted, but the working out of the details of the building and the beauties of the decorations came with the discovery of the artistic possibilities of the corn plant. This year it is different. Profiting by past experience, competent architects were secured, who prepared carefully drawn plans of the framework of the structure, and, taking these plans as a guide, artists sketched and prepared outlines of the decorations. The building erected this year is 150 x 150 feet in size, and occupies every inch of a quarter block of ground. At the southwest corner or main entrance rises the main tower to a height of 175 feet, while to the east and north are Norman towers, which support the Moorish pavilions. The roof of the main pavilion is shingled, thus insuring a dry interior. In the main tower there is a winding stairway, and from the top a view of the city can be obtained.

The great body of the outside is covered with ears of corn, sawed lengthwise through the center, and nailed with two brads with the flat or cob side next to the walls. To relieve the monotony, different colors are used, and white, red, speckled, purple and golden-yellow ears were obtained. The exterior is laid off into panels, which are plainly marked by the varied colors of the great Western product. Next to the ground is a wainscoting of corn stalks, stripped of their leaves and packed close together. The entrances, windows, &c., are also bordered with corn-stalks prepared in the same way. The railing of the towers is also covered with corn-stalks, and the long stalks of grain—wheat and oats—while the capstones of the

turrets are represented by the bushy heads of millet, bearded oats and sorghum seed. The windows of all the towers are latticed with corn ears strung on wires. Some are purple, some are red, others yellow, and still others white, giving that variety of coloring which is at once the charm and novelty of the general effect. The interior of the palace is decorated with striking originality. It is lighted by electricity, and is fitted with appliances for fighting fire, and has a perfect system of sewerage. The palace is built by an incorporation known as the Sioux City Corn Palace Exposition Company, having an authorized capital of \$250,000, the idea being to make the institution a permanent one. Over 50,000 bushels of corn and grain were used in its construction.

Industries of Knoxville, Tenn.

Knoxville, Tenn., does not boast of a boom, but its industrial progress is quite satisfactory to the inhabitants. The city is situated in the midst of a great agricultural country, and being near large areas of the finest timber and coal deposits it seems destined to become a very important inland city. The population has grown from 12,000 in 1880 to over 40,000 by actual count. It has few great manufactures to boast of, yet possesses ample water-power in the bold streams near by, particularly the Tennessee River. The city needs a few more railroads. Some are being built and others located. The East Tennessee, Virginia and Georgia have their construction and repair shops and general offices in Knoxville. This road is doing a heavy business, taxing the rolling stock to its limit, and necessitating heavier steel rails to be laid on part of the track. In their shops the company have built several locomotives complete, which are doing service regularly and are among the finest on the line.

The wholesale hardware trade of Knoxville is very large and important, carried on principally by George Brown, Woodward & Co., C. M. McClung & Co. and S. B. Luttrell & Co., and reaches into Virginia, the Carolinas, Georgia, Florida, Alabama and Mississippi. The marble quarries near the city are being rapidly developed, and are likely to acquire a national reputation, as the quality is excellent and the varieties of colored marble are numerous. The Knoxville Iron Company, of which Jas. R. Ogden is president and A. O. Brown is superintendent, is a well-equipped rolling mill. Mr. R. L. Ralston, of Eastern Pennsylvania, is general manager, and has instituted several improvements. The capacity of the mill is about 35 tons of finished iron per day, and they are now behind in their orders. The product is merchant bar, fish and angle plates and mine rails. The company have just had put in two Smith gas generators by Laughlin & Co., of Cleveland, which have proved successful. They are also trying the experiment of a gas generator under the boilers, the originator claiming economy of fuel and regularity in heat. Mr. Ralston uses the best grades of Virginia and Southern pig, and uses a local ore to counteract the cold short tendencies of the latter irons. The markets for their mill product are principally in the South and the States above referred to.

The programme which has just been issued for the ninth annual convention of the American Society of Mechanical Engineers to be held at Scranton, Pa., beginning on October 15, promises an enjoyable and a profitable meeting. A number of delightful excursions have been provided for and the list of papers and topical queries, as usual, is excellent.

The Iron Age

New York, Thursday, September 27, 1888.

JOHN S. KING, - - - BUSINESS MANAGER.

The Business Outlook.

The improvement in the volume of business during the past two months in the many departments of the iron trade, notably in the West, has given much encouragement. For the first time in a considerable period speculation has played a part in shaping events, although thus far in a moderate degree only. Still, it has led to exaggeration and a distinct effort through the press and other channels to create the impression that a notable rise in values is to come, possibly this fall, and surely next year. It would be idle to deny that such a feeling does not exist outside of purely speculative circles. We have noticed it cropping up repeatedly among manufacturers and merchants both in the East and West. We know of cases in which owners of plants have entered into extensive contracts for improvements and enlargements, with the avowed purpose of being ready to take advantage of the rising tide. In other instances plans have been matured with a similar object in view, though their execution is held in abeyance contingent upon the happenings of the next two months. The basis of convictions leading to such preparations is the broad fact that with a growing population, and after years of retrenching, we are developing a consumptive demand of enormous proportions. Spasmodically the evidences of it have come during the past two years. It needs only one great general impulse, like good crops and fair prices for agricultural products, to cause first a rapid replenishing of stocks in the hands of middlemen, and then the scramble for increased quantities of goods, to cause a sudden rise. There are many who reason that the conditions are favorable to such a movement, and some who have already begun to set their face against any rush which may prove disastrous to legitimate interests in the long run.

As yet this feeling that we are on the eve of a "boom" is vague, but it is shared by many and is being acted on by some. From time to time some unfavorable development shakes the faith of those who are sanguine, but it is noticed that its influence is short-lived, while favorable events make a deeper and more lasting impression and make new converts while strengthening the faith of the more hopeful. It is conceded on all hands that the volume of business is unprecedented. Crops have been bountiful and promise to bring better prices than have been secured for years. The enormous coal tonnage indicates great activity in manufacturing added to increased consumption for domestic purposes. The shipments of Lake ores are heavier than was thought possible in the spring. Freight rates, while demoralized in some very important sections, show some tendency toward im-

provement, and with the enormous traffic handled may soon react in response to further additions to it. With a little more money in the treasury this would bring heavy purchases for new equipment and much needed renewal. In our iron and steel works, our foundries and machine shops, our mines and manufactories, we have gradually but steadily been creeping up to capacity. There is still much margin for increased output by urgent crowding, but as that point is reached the indifference of the seller grows and the raising of prices comes naturally.

Let it be conceded that enormous amounts of money were directed into permanent investment by the phenomenal railroad building of last year. It must be acknowledged that as yet the additions to mileage have been more a burden than a source of revenue to the great lines who undertook them. Yet money is plentiful in all our financial centers and there are many meritorious undertakings awaiting the time when capital will be forced to look for employment at better terms than are now generally offered. It is not to be expected that enterprise will seek new channels of activity while the minds of the majority of our citizens are largely occupied with political responsibilities, while many captains of industry earnestly and honestly believe that the outcome of the struggle now being waged almost exclusively over economical questions must seriously affect our industrial prosperity if it is adverse to their political beliefs. We may suffer serious drawbacks after that contest is decided, but even with all such contingencies to check or to reverse the incipient movement, the outlook is decidedly hopeful. The developments of the early winter must determine whether 1889 is to be a year of exceptional prosperity or not. This question, which is now agitating the minds of a few, may soon become the all-absorbing subject of thought and find more general expression in active preparation.

The pressure of heavy traffic upon the Western railroads which was predicted for the fall months is now being felt. Already such a scarcity of cars has developed that complaints are numerous among shippers. The railroads centering at Chicago are nearly all suffering on this account, and could greatly increase their business if they could get the necessary rolling stock. The railroad companies largely interested in distributing coal are doubly hampered, being pushed by the great demand for coal at this season of the year and urged to supply increased facilities for the transportation of grain to market. Eastern connections of the Western roads are being drawn upon for all the cars that can be spared for this increase in traffic, but the relief derived from that source will only be temporary, as the Eastern roads will probably soon need all their cars themselves. Many Western railroad managers foresaw this condition of railroad business several weeks since, and earnestly advised the people living along their lines to lay in their supply of coal early, as the pressure upon the facilities of the roads promised to be something enormous when the crops began to be moved. This condition of the railroads promises to be of considerable benefit to the iron trade. Large orders are pending for new cars, requiring

considerable quantities of iron and steel, and others will follow as rapidly as the railroad companies find that they must increase their equipment. The expansion of railroad business will probably be of sufficient duration to also enable the companies to accumulate a fund toward the purchase of rails for renewals, now badly needed on many lines, even on some of the most important Western roads.

Our Imports of Iron and Steel.

From England and the Continent come steadily better reports of the improving condition of the iron, steel and allied trades. Americans who have returned from abroad, men who possess exceptional facilities for correctly gauging the feeling prevailing, report that the activity in the leading industrial centers is very great, indeed, and that the advancing tendency in prices is gaining. Nearly a year since *The Iron Age* pointed out that a higher level of values could only be attained after the demand from other markets had more than compensated for the falling off in shipments to this country. With the aid of English export statistics we showed months ago that that point had been reached. The latest returns emphasize this. While generally speaking the English exports show an improvement only in some lines, the shipments to other countries outside of the United States have increased. Thus we have for the first eight months:

English Exports of Iron and Steel, Eight Months, Gross Tons.			
	1888.	1887.	1886.
<i>Pig Iron:</i>			
Total.....	688,532	955,922	711,358
United States.....	230,251	238,736	100,225
Other countries..	458,281	717,186	611,133
<i>Bar, Angle, Bolt Iron:</i>			
Total.....	153,013	165,418	195,562
United States.....	2,284	1,809	3,274
Other countries..	150,729	163,609	192,288
<i>Railroad Iron, all sorts:</i>			
Total.....	502,250	642,543	703,978
United States.....	21,746	112,531	39,582
Other countries..	480,504	529,712	664,396
<i>Steel Rails (included in above):</i>			
Total.....	334,350	483,908	482,523
United States.....	21,114	110,239	38,321
Other countries..	313,236	373,709	444,202
<i>Wire:</i>			
Total.....	26,892	27,748	42,981
United States.....	2,957	2,594	1,810
Other countries..	23,935	25,154	41,171
<i>Hoops, Plates and Sheets:</i>			
Total.....	198,608	220,327	270,447
United States.....	13,758	21,081	28,082
Other countries..	184,850	199,246	242,365
<i>Tin Plates:</i>			
Total.....	232,738	235,901	263,583
United States.....	186,490	179,236	196,338
Other countries..	46,278	56,665	67,174
<i>Old Iron and Steel:</i>			
Total.....	94,299	205,010	100,491
United States.....	33,944	147,662	16,190
Other countries..	60,355	57,348	84,301
<i>Unwrought Steel:</i>			
Total.....	73,641	214,708	100,372
United States.....	36,895	170,224	45,803
Other countries..	37,746	44,484	54,569

With the exception of hoops, plates and sheets, and of tin plates, the figures of exports to the United States show a marked reduction. Nor is this confined to our imports from Great Britain, as the following import statistics of our Bureau of Statistics for the first seven months, in gross tons, clearly show:

American Imports of Iron and Steel.		
	1888.	1887.
Iron ore.....	332,240	684,582
Pig iron.....	112,989	280,888
Scrap iron.....	31,267	219,736

Scrap steel.....	6,372	20,726
Bar iron.....	14,572	20,373
Rails.....	49,128	53,065
Cotton ties.....	7,811	6,696
Steel hoops, sheets and plates	13,244	15,437
Steel blooms, slabs, billets and bars	66,104	210,581
Sheet, plate and taggers iron..	3,265	3,063
Tin plates.....	173,537	168,359
Wire rods.....	67,821	98,523
Wire and wire rope.....	1,969	1,449
Anvils, axles and forgings.....	849	861
Chains.....	491	442

The English figures quoted above are particularly interesting, however, as proving that, deducting the quantities sent to this country, the balance, which represents the English exports to the rest of the world, shows a notable betterment in the demand. While in some lines this has not yet compensated English iron-makers for our lessened purchases, it does prove that their position as sellers has grown more favorable. This has already found expression in higher prices and in a revival of speculation for an advance. To us the importance of this fact lies in the circumstance that it raises the limit which we may reach in values before inviting heavily increased shipments. Should a rapid expansion in the demand here ultimately cause heavier buying abroad, then its addition to a good business with other countries would accelerate an already rising tendency. This is an additional circumstance which would place an upward rush here within the range of possibilities. It is a point which should be carefully considered by buyers and sellers alike if the swelling demand in this country should in the next quarter assume proportions which a few anticipate and many do not consider impossible.

Chicago and St. Paul Freight Rates.

The matter of the Chicago, St. Paul and Kansas City Railway, just decided by the Interstate Commerce Commission, has some interesting features. This railroad asked for a ruling permitting it to make higher rates to intermediate points between Chicago and St. Paul or Minneapolis than is charged upon through traffic to and from the same points. This was asked upon the ground that a rival line was quoting these low through rates, though not earning operating expenses, and that the road in question should be allowed to compete for this through business without lowering local charges to the same level, or else the C., B. and N. should be compelled to advance their supposed ruinously cheap tariffs. Neither of these points was acquiesced in by the commission. The Interstate act was passed, they say, for the protection of the public and not to help one road against another, it being supposed that the carriers would arrange their own tariff matters and protect themselves.

In our way of looking at the case, the defending railroad did not make the best possible case of its low through and locally higher rates, and perhaps the omission was partly intentional. The reason of the low rates on the C., B. and N., which caused all the trouble, is given by the traffic manager of that road as "owing to the extremely low rates prevailing by Lake Superior lines." This seems to be almost the only mention of water competition made at the hearing, and yet it is the most potent cause of the whole trouble. If the traffic concerned only the

cities of St. Paul and Chicago the matter would be simple enough, but the seaboard cities and the chain of waterways must be taken into account. Minneapolis flour and grain, destined for the East or for export, will pay no more via Chicago than via Duluth or Sault Ste. Marie, and the railroads between Minneapolis and Chicago cannot, therefore, maintain for any length of time any rate much higher than the rate to Lake Superior. In the same way, the rate on return shipments from the manufactories must be correspondingly low. When the through rate from New York to St. Paul, via rail to Buffalo and lake to Duluth, is on first class but 50 cents (not including insurance), and the rate from New York to Chicago is 35 cents, it seems plain that on traffic from the East for the Northwest the C., B. and N., or any other road, cannot get 60 cents, no matter whether anything less would be a losing rate or not. The true defense, therefore, it seems to us, would have been just such competition between rail and water carriers as the Interstate Commission had already decided constituted the differing circumstances allowing differing rates. It is, of course, true that all the traffic passing north from Chicago does not originate east of that great city, and it would be interesting, for many reasons, could we know what proportion of this business is actually made up there, excluding such goods as have been sent to Chicago from New England or Pennsylvania and reshipped by jobbers or from warehouses. No doubt such reshipments constitute a very important part of the total traffic. But even of the goods manufactured in the great works of that city it can be said that they must be sold in the Northwest in competition with goods made further East, but which have had the advantage of this cheap lake carrying. So, from whichever point of view we look at the problem, the importance of the waterway is seen.

Another point in the matter is that an evident way of escape was not even mentioned and that is the making of a through rate between New York, or Boston, or Pittsburgh and the Northwest, a rate which could be less than the rate to Chicago plus the rate from Chicago to St. Paul. This would have enabled the Chicago, St. Paul and Kansas City to have collected a low rate on competitive water traffic, while charging on the business originating at Chicago a higher rate. No suggestion of such a plan was heard from the lips of any of the railroad men. This fact speaks volumes for the strength of Chicago's influence and for the alertness and enterprise of her business men. A moment's thought will show the severity of the blow such a plan would strike against her jobbing trade. As the case now stands Chicago is a basic point for rates. Tariffs are so constructed that everything manufactured in Pennsylvania or elsewhere can be shipped to Chicago, resold, and shipped to points further West without any additional charges for the break at Chicago. If now it be once admitted that this rule must on any account be broken and the rate from New York to St. Paul be lower than the rates charged to Chicago and out again, then the wholesalers of that city lose control of so much trade. As remarked before, it is most significant that railroad man-

agers will appeal to Washington on purely technical grounds for permission to charge the small towns a high rate, but will not one of them whisper that exactly this thing can be done if only they will charge Chicago shippers as high as the local dealers, and higher than manufacturers further East. It may yet happen that these Chicago-St. Paul railroads will be forced to recognize the facts of the water competition by the lakes and meet the through competition between the seaboard and St. Paul by a through route, but this will not be done at present. The influence of Chicago is too firmly established. It was a knowledge of this fact which caused the building of the Soo line as "an anchor to windward" by the Minneapolis millers.

Our Trade With Japan.

Our domestic export to Japan has increased so much recently under the impulse of growing prosperity in that country, that an examination of the financial reforms and industrial expansion going on there may be useful. One of the greatest drawbacks with which Japan had to contend was the paper money; in 1885 specie payment was resumed after the paper money had depreciated 45 per cent. of par. Confidence was restored, and the Government finances since then took an even course. During the nine months that followed resumption, fiscal year 1885-86, the income was \$56,622,173, and the outlay \$56,620,275; in 1886-87 the respective figures were \$74,695,415 and \$74,689,014, while the budget estimate for 1887-88 fixes the revenue at \$79,936,870, and the expenditure at \$79,935,553. The national indebtedness is large, amounting on July 1, 1887 to \$249,108,578, but with the exception of \$7,522,032 it is internal, and the Nakasendo Government railroad represents \$20,000,000 of it. In the budget the army figures with \$12,045,994 expenses, and the navy with \$12,006,052. In order to maintain her independence against China, Japan has an army whose effective strength, rank and file, is 54,388 men, and a navy ready for operations of 221 steamers, with a joint tonnage of 40,090 and 50,979 horse-power, one of them being an armored vessel. As per census of January 1, 1886, the native population at that time was 38,151,217, the area being 382,418 sq. km., and there were 7117 foreigners, 4143 being Chinese, 1423 Englishmen, 592 Americans, 343 Germans, 198 Frenchmen, and 418 of other nationalities.

Greater progress would have been made in railroad building if foreigners had been allowed to engage in it direct; for this very reason a speedy revision of the treaties with foreign nations is much to be desired. Up to last year the Government alone built the railroads, and 870 miles went into operation, a start having been made in 1868. In 1887 there were 151 miles added, 11 domestic companies being formed, with a joint capital of \$32,000,000. The first lines which the Government built cost \$50,000 per mile, but the present cost of construction is only \$18,000. The Japanese Railroad Company paid in 1887 a 10½ per cent. dividend, the operating expenses averaging 45 per cent. of the gross earnings. In 1885 the Government negotiated an 8 per cent. railroad loan, the one above alluded to, which was

quickly taken up. Japanese engineers made the surveys, and all of the employees are natives, yet mistakes and accidents are of rare occurrence.

Marine stations for the navy are multiplying. At Kure, a few miles distant from Hiroshima, an extensive station is being constructed in connection with a lagoon, and the dock frontage is to be $1\frac{1}{2}$ miles; a smaller station is in course of construction on the west coast of Kinshin, in the vicinity of Nagasaki; while the island of Tsu-Shima, in the Straits of Corea, is being strongly fortified. The large cities are fast being provided with water-works, and Yokohama has a new aqueduct, which was finished in October last. Harbor and river improvements are being actively pursued at a number of points.

Some 20 years since Japan could not boast of the existence of any native mercantile or industrial companies, the feudal system preventing their formation till then. Last year, in three cities alone—Tokio, Osaka and Kioto—no less than 111 companies were formed, with a joint capital of \$21,500,000, while 13 banks increased their capital by \$18,000,000. Adding thereto the \$32,000,000 of the 11 new railroad companies, it appears that \$71,500,000 in shares were subscribed for among the people in a single year, or about \$2 per capita. The new companies al-luded to built new factories, &c., chiefly for cotton and paper mills, dyeing establishments, glass factories, wood-working shops, works for the preparation of tea and silk for export, express companies, machine shops, truck farming, horticultural and fishery enterprises, china, lacquer-ware and bronze goods factories, brickyards, ice houses, manufacture of artificial manures, all leading to new enterprises. On December 31, 1886, there were in operation 22 cotton mills, containing in all 76,000 spindles, turning out 1,320,000 pounds of twist. In 1887 their number was increased by eight large mills, with 117,000 spindles. The Japanese cotton crop yielded last year 7676 tons, but this year the crop will be more bountiful, the Government having stimulated cotton culture by advancing money to small farmers. Till now Japan had to import cotton to a notable extent. It is hoped that soon there will be no necessity for it nor for importing twist from Bombay and cotton goods from Manchester. A brewery is to be built at Tokio, the share capital being \$150,000; the capital of the Tokio Electric Light Company is to be increased \$500,000 in a couple of months, and that of the Cattle Breeding Company \$300,000. Japanese workmen are skillful and wages low.

In 1887 the foreign trade of Japan reached a total of \$95,000,000, being an expansion of 86 per cent. within a decade, for in 1877 it did not exceed \$51,000,000. The total trade between Japan and the United States amounted during the nine fiscal years 1870 to 1878 together to \$84,059,000; during the last nine fiscal years, 1879 to 1887, it reached a total of \$147,827,000, an increase of about 75 per cent. During the calendar year 1887 the American trade exhibited the figures below as compared with 1886.

	Import.	Dom. exp. to Japan.
1887.....	\$17,742,288	\$4,150,777
1886.....	17,012,688	2,774,622
Increase in exports to Japan.....		1,376,156

In the fiscal year 1887 we shipped to Japan 21,983,462 gallons of refined petroleum, and received thence 2,312,179 pounds of crude camphor, 15,993,843 pounds of rags, 2,165,329 pounds of raw silk and 39,269,448 pounds of tea. Silk production increases rapidly in Japan, and so does the manufacture of silk goods. In a couple of years, when the new railroads are in operation and tap the most fertile tea districts, together with those where mulberry trees and silk worms flourish best, Japanese progress will not unlikely become still more astonishing. With growing prosperity the Japanese will take American goods more freely, the more so as we take nearly all her tea, and year after year more silk. This is all the more gratifying since the initiative of the American nation threw Japan open to international intercourse and civilization.

OBITUARY.

J. G. BRILL.

John George Brill, president of the J. G. Brill Company, and founder of the Philadelphia Car Works, died on Saturday morning at his home in Philadelphia, after an illness of more than six months. Mr. Brill established himself with his son, T. Martin Brill, in a small way, in the business of car supplies on Chestnut street, and later on, as their means increased, gradually drifted into the building of tram cars, and afterward into the manufacture of all classes of railway cars. In 1872 they obtained the first large order of railway cars that came to this country from Mexico, and since that time have made the greater portion of all the cars ordered from that country. The demand for their cars came not only from all parts of this country, but also from Europe, Asia, Australia and Central and South America. At present 40 per cent. of orders received are for foreign account. Mr. Brill introduced many novelties in the manufacture of cars, and was a thorough and conscientious mechanic. He was prouder and more ambitious regarding the good quality of work than money getting. He considered his greatest triumph the obtaining of the highest award, a gold medal, for the best tram car at the Exposition of Railway Appliances, in Chicago, in 1883. Mr. Brill was born near Cassel, Germany, in 1817.

WILLIAM MILLER.

William Miller, one of the oldest and best known iron manufacturers in the West, and chairman of the Miller Forge Company, Limited, of Pittsburgh, died on Friday evening, the 21st inst., at his home in Allegheny City, Pa. He had been suffering from typhoid malaria for nearly three months.

William Miller was born at Duntochar, near Glasgow, July 21, 1820, and came to America in 1849, connecting himself with the West Point Foundry, at Cold Spring, on the Hudson River. In 1855 he returned to Scotland, with some intention of again permanently locating. At this time he was employed in the works of the Dennys, near Dumbarton, where the famous Clyde steamers were built. He returned to America in 1858, and, passing through Pittsburgh on a trip West, was suddenly led to a determination to settle there with J. P. Haigh, in the West Point Forge, on Water street. This was afterward merged into the Duquesne Forge, on First street and Duquesne way, in 1860, where Mr. Miller became sole proprietor in 1864. During the war some of the most important forgings used by the Government

were made here. In 1882 the business was still further enlarged and a new building put up at Rankin station, on the B. and O. R. R., under the name of the Miller Forge Company. He leaves a widow and six children, four daughters and two sons, William I. Miller, vice-president of Glenwood National Bank, at Glenwood Springs, Col., and Humphries Miller, secretary and treasurer of the Miller Forge Company.

WILLIAM BAROGWANATH,

a prominent boiler manufacturer of Chicago, died on the 20th inst., aged about 70 years. He was the senior member of the firm of William Barogwanath & Son, well known throughout the Northwest.

CORRESPONDENCE.

The Life of Iron Roofs.

MARSHALLTOWN, DEL., September 17, 1888.

To the Editor.—Since the article, "The Life of Iron Roofs," appeared in *The Iron Age* I have received numerous inquiries for further particulars concerning the roofs alluded to. If it will interest your readers please say the sheathing used was made of stock boards laid as closely as possible. The under side of the metal had two good coats of paint, but was not otherwise protected, and, as far as I can observe, has not rusted. The gauge of iron used was No. 26. The cleats on the standing seams are not exposed. Mr. Caleb Marshall, who owned this property from 1837 to 1861, informs me that I made an error in my statement on August 16, in that the barn roof was put on in 1840, and not in 1846. I have about 75,000 square feet of iron roofing, which, after many years of service, has been very satisfactory.

Yours respectfully,

J. R. BRINGHURST.

The Alaska Commercial Company.—

The operations of the Alaska Commercial Company receive further attention from Chester Seeber, of San Francisco, formerly United States Commissioner for Alaska, who has written a letter for the purpose of showing that the company uses the power acquired under its contract "to monopolize the whole trade of western Alaska, oppress the inhabitants and to retard the development of the country." Mr. Seeber says the geographical conditions of western Alaska render the country impenetrable, except by navigation of its vast rivers, which flow westward into Behring Sea. All the commerce of the country flows through this sea and past the seal islands of St. Paul and St. George, which are held by the Alaska Commercial Company. Revenue steamers, he says, are kept at the expense of the Government throughout the summer months, constantly in attendance about the seal islands, and any unfortunate vessel discovered in Behring Sea is searched and if found to contain any furs, no matter where or how obtained, is seized and subjected to condemnation and sale. This arbitrary action, he says, on the part of the Government practiced at the solicitation and by the procurement of the Alaska Company, renders any attempt, however lawful, of any individual to do any trading with the country perilous and in most cases results in irreparable loss. Mr. Seeber endeavors to show that the company have substantial reasons for wishing to maintain its primeval domains undisturbed.

The search for the treasure ship sunk long ago off the Delaware breakwater has been abandoned. The only trace of metal discovered was verdigris from supposed contact with copper sheathing or a gun.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., September 25, 1888.

The Sub-Committee on Finance at last submitted their tariff bill to the full committee to-day. Owing to some undetermined points as to the amount of reduction on certain articles the committee determined to withhold their schedules from publication until they could have a further consultation and also to enable them to perform the courtesy of submitting their bill to Senator Beck, who is in poor health at Fortress Monroe. A full copy of the bill was prepared and placed in a sealed packet and intrusted to a deputy sergeant-at-arms to be conveyed to Senator Beck. It is expected that the acknowledgment of the Senator will be received by Thursday, at which time the committee will have another meeting.

The aggregate results of the differing views of the majority are as follows:

Total repeal of tobacco tax.....	\$30,000,000
Repeal on manufactured tobacco.....	25,000,000
Total repeal of duty on sugar.....	56,000,000
Fifty per cent. reduction.....	28,000,000
Repeal of tax on fruit brandy.....	1,500,000
Repeal on alcohol used in the arts....	6,000,000
Reduction of duty on manufactures caused by equalizations and readjustment.....	10,000,000

There is also a cut of 50 per cent. on rice, which would add, approximately, \$8,000,000.

The maximum reduction proposed is: Repeal of internal taxes, \$83,000,000. The minimum reduction proposed is \$70,000,000.

It is the reconciliation of these differing views which may consume some days. The general disposition, however, is to permit certain features, such as the amount of reduction on sugar and rice, if any, and tobacco to be determined in open Senate.

Owing to the continued indisposition of Senator Beck, Senator Harris has been selected to prepare the minority report. He informed the committee that it would require several weeks for him to complete the task. There is a very general disposition on the part of the Democrats to enter into a full discussion of the Senate bill, in contrast with the Mills bill. The metal schedule has been prepared in conformity with the views of representative men in the different branches. The reductions are stated by members of the committee as not being material in any case. The unification of iron and steel duties as far as practicable is said to be the most important change, and is claimed not to result in much of a reduction.

The duty on tin plate remains at its present rate of 1 cent a pound. The committee were favorable to the increase required to place that article on a protective basis, but could not see their way clear to such a step when public sentiment has not yet recorded itself on the opposite positions held by the two great parties now marshaling for control of the administration of the Government for the next quadrennial period. Lumber remains at present rates and wool is unchanged, except an increase of 1 cent on the finer grades. Mr. Cramp has had a conference with Chief Constructor Wilson, in which he stated that owing to the floods it was impracticable to extend the ways so as to increase the precautionary measures taken to insure a safe launching of the cruiser Baltimore, next Saturday.

The recent rapid advance in the price of old iron rails, coupled with the cheapness of new steel rails, would seem to present a very favorable opportunity to railroad companies for renewing their tracks. Some of them have taken advantage of this condition of affairs, but the business thus cre-

ated has by no means assumed the proportions naturally to be expected. In the case of Western railroad companies the reason assigned for their non-action is their inability to raise the necessary cash to purchase new steel rails as a preliminary step toward taking up old iron rails. Here is an opportunity for the intervention of financiers who will advance the purchase-money for new rails and take in payment the old rails and a cash difference to be agreed upon. We are informed that Chicago parties are ready to make such an arrangement with railroad companies of good repute, and there are probably other agencies which would be willing to handle business of this character if application was made to them. The steel-rail manufacturers are anxious for orders, but they cannot afford to engage in financial operations of this sort to a great extent. They would be obliged to search for buyers of old iron rails and would probably be at a disadvantage in this respect when competing with those who make a specialty of the old-rail business. The suggestion herein conveyed may be of benefit to both manufacturers and consumers of steel rails.

Bells in History.

Bells have a large place in history, almost larger than any other object that could be mentioned unless we must except some of the implements of destruction. Their great antiquity, says *Lock and Bell*, is beyond question. An explorer among the ruins of Ninevah, or some other of those vanished Oriental cities, claims the discovery of a bronze bell, and the citizens of Rome came together in their public places at the signal of bells. But the Roman bells were elongated pieces of forging about as musical, it is to be presumed, as a modern cow bell. It was not until mediæval and modern times that the bell ringer became a man of very distinguished duties. Who has not heard of the Sicilian Vesper bells, rung in the year 1282 as a signal for the death of 8000 Frenchmen, slaughtered so that Sicily might be free? Who has not heard again, and shuddered as he listened, of the bells of St. Bartholomew, the signal, it is said, for the death of 100,000 persons? And the 8 o'clock curfew bell that rang through all England at the bidding of William the Conqueror, as a warning to his newly-made slaves to "douse the glim;" has it not echoed in faint and still fainter tones through all the pages of English history down to date? But it has not been the fate of all bells to be made to give the signal for slaughter or oppression. The Philadelphians have their fondly cherished Liberty bell. It is held in such esteem that it was borne half over the continent a few years ago under the escort of a guard of honor to protect it from all injury. It proclaimed once from its brazen lips the birth of a new nation, and hence if it be not made to endure as long as the nation itself it will be because metal is more perishable than the work of the Revolutionary architects.

Curious Guns.—Among the many things to be seen at the United States Museum, at Washington, are two guns which exhibit the most elaborate workmanship. They were presented to Thomas Jefferson, not by the Ahkoond of Swat (he is dead, poor fellow), but by the Emperor of Morocco. The first is a flint-lock musket, 77 inches long, smooth bore; the barrel is of steel, and for half its length is octagon; the remainder is round. The stock is of oak inlaid with arabesque design in gold covering the woodwork. Six bands of gold hold the stock and barrel in place. The flint-lock is of a peculiar pattern, heavily inlaid with gold, also of arabesque pattern. There is no trigger

guard. On the butt there is a solid gold plate. The ramrod is ebonized, headed with a gold plate a foot long, altogether a costly and magnificent piece. No. 2 is a Moorish flint-lock musket, smooth bore, steel barrel, in shape octagon the entire length. The whole gun is 5 feet 8 inches long. The barrel and stock are connected with three silver bands. On each side of the stock are double rows of pear-shaped coral ornaments inlaid in solid silver bands. There is a solid gold plate on the butt, which is inlaid with a thick silver plate. The ramrod is coral ornamented with silver. This gun is also a present from the Emperor of Morocco to President Jefferson.

A Capillary Steam Boiler.

At a recent meeting of the French Society of Civil Engineers, in Paris, M. Serpollet described his new tubular boiler, for which he claims that it cannot possibly explode. The boiler consists simply of a solid-drawn steel tube, which has, with the exception of its two ends, been rolled out flat, so as to leave in it a channel only 0.1 to 0.3 mm. wide. The tube is then coiled spirally, and its inner end is bent up vertically to receive the steam pipe, while the feed-pipe is screwed into the outer end of the spiral. This spiral tube boiler is placed into a furnace, which may be of the slow combustion type, and there is no need for either stop valve, blow-off cocks, gauge glass or safety valve. The feed water, upon entering the capillary channel within the tube, is instantly converted into steam, and issues perfectly dry. The tube of a 1 horse-power boiler is 6 feet 6 inches long, and when flattened out 4 inches wide; its total heating surface is about 5 square feet, and it is said to evaporate 45 pounds of water per hour, with a consumption of 9 pounds of coal. The supply of steam to the engine is regulated by regulating the amount of feed water sent into the boiler, and for this purpose the inventor arranges the regulator of the engine either to act upon the waste cock of the feed pump or upon a sliding block, by which the stroke of the feed pump is altered. There being practically no water in the boiler, the regulation is said to be as precise and quick as with the usual types of engines. To stop the engine it is only necessary to close the cock on the suction-pipe of the pump, or open the waste cock fully. A few days after M. Serpollet had brought this boiler before the Société des Ingénieurs Civils, he showed the application of it to a steam driven tricycle in the streets of Paris. The boiler was carried behind the axle of the main driving wheels, and the engine was fixed under the rider's seat, which also contains a supply of water and fuel. A speed of 6½ miles an hour was attained over roads having 1.5 per cent. grades. The weight of the tricycle in service, but without the rider, is 3½ cwt.

The plant now employed on the Manchester ship canal includes 98 locomotives, 3221 wagons, 51 steam navvies, 49 steam cranes, and 104 pumping and other engines, with 161 horses and 8568 men and boys. Almost the whole of the land required for the construction of the canal has now been acquired by the company.

An interesting experiment has been made at Toulon, with the object of demonstrating the utility of a captive balloon in observing from a considerable height the movements of an enemy's fleet. A naval officer seated in the car of a balloon was in telephonic communication with the frigate *Indomptable*, to the commander of which he signalled, as if in actual warfare, all that he could observe from his elevated position.

Wages at the Edgar Thomson Works.

The Pittsburgh newspapers report the wages earned by the men at the Edgar Thomson steel works of Carnegie Brothers & Co., at Braddock, Pa., for the month of August, on the sliding scale based on a selling price in that month of \$31.50. Good machinists now make on an average of \$82 per month, or about \$2.90 per day. No machinist makes less than \$2.50 in 10 hours. For night work they get time-and-half-time, and for Sunday work they are paid double. Machinists' wages, and those of the blacksmiths are the same as they were last year. The latter make \$70 a month, or about \$2.50 per day. Blacksmiths' helpers' wages range from \$1.50 to \$1.60 per day of 10 hours.

The converting-millmen were even surprised themselves in receiving the amount of money they did for the month of August. It is true that a great many of them work 12 hours, but the amount of money they received in excess of that for any month of 1887 had a tendency to make them feel just so much better on pay day, and they were wholly satisfied. All over the converting mill, from the troughman to the scrappers, the wages are in advance of those of 1887. The latter work 12 hours, and were paid for August \$1.62 per 100 tons. In 1887 they got \$1.90 per 100 tons. The quantity of steel that can be turned out in 12 hours is so much in excess of that turned out in eight-hour turns that their wages for last month were much bigger than for any month in 1887 before the sliding scale went into effect. Scrappers' wages for the month of August were \$212.37, or \$8.13 per day.

The foremen of the cupolas were paid \$1.40 per 100 tons. They made \$184.14 in August, or an average of \$7.87 per day. Their helpers are paid \$2 per day. The exact earnings of vessel foremen could not be obtained, but their wages are not less than \$100 per month. The troughmen got 92 cents per 100 tons, and made \$121.20, or an average day's pay of \$4.27. The ingot pourers worked eight hours at \$1.40 per 100, and made \$122.76, an average of \$4.25 per day. The pull-arounds were paid \$1.10 per 100 tons, worked eight hours and made \$96.14, or very nearly \$4 per turn. Steel blowers got \$1.14 per 100, and made \$99.63, or an average day's pay of about the same as the pull-arounds. The pulpit boys got 82 cents per 100 tons. They work 12 hours. Last month their net earnings were \$71.66 each, or about \$2.80 per day. The bottom-makers in the converting mill made an average day's wages of \$5.50 in 12 hours. Their helpers are paid by the day, and receive only ordinary laborers' wages.

The employees of the blooming department made better wages than in any previous month since the erection of the works. Of course they all work 12 hours. The foreman and salaried men's wages are known only to themselves and the firm. The first helpers received \$1.39 per 100. They made \$157.66, or over \$6 per turn. The second helper got \$1.02 per 100, and made \$126.94, or about \$5 a day. The lever boys in this department made \$40.25. The men who worked about the shearers got 91 cents per 100. Their month's pay amounted to \$103.22, a fraction less than \$4 per day. The chippers at the hammer were paid the same as the second helpers in the blooming mill, and the helpers at the hammer received the same as the shear-men. The rollers in the blooming mill are salaried men, and only work eight hours. The table men get \$1.13 per 100. Their month's pay footed up \$128.17—about \$5 per day. In the rail mill there is no distinction made, except with the rail straighteners and gaggers, who work eight hours. All the rest work 12. The amount they get per ton is something less than what

they received during 1887; but, by working 12 hours, they were all able to make wages that even excelled those of any month during the year of 1887. The rail mill heaters last month were paid \$1.48, and made \$153, almost \$6 per day. The buggy boys are paid \$2 per day. The lever men at the roughing rolls got \$2.40 per day; the lever men at the short rolls, \$3.50, and the guide setter at the finishing rolls, \$3 per day; first helper on hot bed, \$2.40; hot bed, second helper, \$2. The rail straighteners worked eight hours and got \$1.58 per 100 tons, and made, for the month, \$113.76, or over \$5 per day. Gaggers also work eight hours. Per 100 tons they got 90 cents, and made \$64.80, or about \$2.50 per turn. Chippers got \$2.50 for a day of 12 hours; drillers, \$2.50. These men's wages, as well as those for the chippers, are gauged by the rise and fall of the market. Rail loaders got 65 cents per 100, and their net earnings for the month were \$100. The cold sawyers got \$1.50 per day of 12 hours' work, and the water tenders \$2.70 for the same number of hours per day. Engineers' wages range from \$1.60 to \$1.80 per day, and brakemen's from \$1.25 to \$1.40.

At the furnaces the only change is that the men work longer hours and make more money. The keepers, whose earnings in 1887 rated at \$2.40 per day, last month made, on an average, \$2.90. The engineers make \$2.53 in 12 hours this year, as against \$2.90 in 12 hours last year. The fillers' wages last month averaged \$1.85 per day, as against \$1.55 per day, working on eight-hour turns, last year. Keepers' helpers, \$2.32; last year, \$1.97. The stock-yard laborers receive \$1.58 per day, against \$1.40 per eight-hour turns last year.

Recent Legal Decisions.

CONSPIRACY TO "BOYCOTT" MANUFACTURER.

P. P. Sherry made shoes, and a difficulty arose between him and a portion of his workmen. These workmen, through the president and secretary of their trade union—the Lasters' Protective Union—caused a banner to be made and to be carried in front of Sherry's factory, upon which was this inscription: "Lasters are requested to keep away from P. P. Sherry's until the present trouble is settled. Per order L. P. U." Sherry filed a bill for an injunction against the president and secretary of the union to restrain such use of the banner, on the ground that its use was part of a scheme to intimidate persons from continuing or entering his employment, which scheme was devised to injure his business. The trial court found that there was a scheme and that the use of the banner was a part of it, and the case—Sherry vs. Perkins and Leach—was reported to the Supreme Judicial Court of Massachusetts, where an injunction was granted. Judge William Allen, in the opinion, said: "The illegal scheme has been found to exist by the court below. The act of displaying banners with devices, as a means of threats and intimidation, to prevent persons from entering into or continuing in the employment of the plaintiff was injurious to him, and illegal at common law, and by the statute of this State. We think the plaintiff is not restricted to his remedy by an action at law, but is entitled to relief by injunction. The acts and the injury were continuous. The banners were used more than three months before the filing of the plaintiff's bill, and continued to be used to the time of the hearing. The injury was to the plaintiff's business, and adequate remedy could not be given by damages in a suit at law. The wrong is not, as argued by defendants'

counsel, a libel on plaintiff's business. It is not found that the inscriptions upon the banner were false, nor do they appear to have been in disparagement of the plaintiff's business. The scheme, in pursuance of which the banners were displayed and maintained, was to injure the plaintiff's business, not by defaming it to the public, but by intimidating workmen, so as to deter them from keeping or making engagements with the plaintiff. The banner was a standing menace to all who were or wished to be employed by the plaintiff, to deter them from entering his premises. Maintaining it was a continuous and unlawful act, injurious to plaintiff's business and property, and was a nuisance, such as a court of equity will grant relief against."

CONTRACT IN RESTRAINT OF TRADE.

N. owned certain land which contained deposits of sand, and he sold to S. a portion of the property, about half an acre, upon the condition that he would not sell any sand off the premises. The deed contained this covenant. S. conveyed his land to his son R. S., but his deed for it had no reference to the restrictive covenant in N's deed to him. Against the protest of N., R. S. opened a sand pit and began to sell sand, and he sued for an injunction, but his complaint was dismissed on the ground that the covenant was against public policy, and void. N. died, and his executor was substituted as plaintiff. The case, Hodge vs. Sloan, was carried to the Court of Appeals of New York, where the plaintiff prevailed. Judge Danforth, in the opinion, said: "The decision below is against our idea of natural justice, for it takes from one party an advantage which he refused to sell, and secures to the other, without price, a privilege which his grantor was unable to buy. The covenant is not against public policy, for if it is in restraint of trade, it is still valid if it imposes no restriction on one party which is not beneficial to the other, and was induced by a reasonable consideration—or, in other words, if it was a proper and useful contract, or such as could not be disregarded without injury to a fair contractor. The covenant also ran with the land and binds R. S. though it is not mentioned in his deed."

Terms Used in Electrolytic Deposition of Metals.—The terms "cathode" and "anode," says an electrical paper, are synonymous with the positive and negative poles of an electric or galvanic battery. Then to measure the volume of electricity passed between these points, the term "ampères" is used as the unit, like feet or cubic feet, for measuring in the usual mechanical sense. For expressing the force with which the volume of electricity is propelled, the term "volt" is used as the unit. The resistance opposed to the electricity is measured by "ohms." The work done in the electrical circuit is expressed by "watts" in the same way that in a steam engine the power developed is expressed by h. p. To put it briefly, thus:

$$1 \text{ ampère} \times 1 \text{ volt} = 1 \text{ watt.}$$

$$1 \text{ watt} \times 746 = \text{e. h. p.}$$

These are the electrical terms employed by common consent in all European languages in connection with this science.

In a report to his company the chief engineer of the Engine, Boiler and Employers' Liability Insurance Company, of London, England, proposes the following rule for the safe working pressure for cylindrical furnaces in flues: Safe working pressure = $\frac{50 t^2}{\sqrt{ld}}$ where t = thickness of plate in thirty-seconds of an inch, l = length of flue in feet, d = diameter in inches.

THE WEEK.

The Senate Finance Committee will begin its hearings on the alleged copper trust to-day.

The Treasury Department has refused to grant the application of Messrs. Snow & Burgess, New York, for a refund of all or part of the duties recently exacted upon the sheathing metal withdrawn in 1886 for use in construction of the ship *Corsica*, with a rebate authorized by the Tariff Act of 1883, on the ground of the applicants, that the vessel has been confessedly employed in the coasting trade for more than two months during the year ending February 6, 1888, and of the express provision contained in said law that vessels receiving the benefit thereof shall not be allowed to engage in the coastwise trade more than two months in any year, except upon the payment of the duties upon which a rebate is allowed.

A. M. Shannon & Co., of Galveston, are the lowest bidders for the construction of the Government jetty at that port. Their bid is \$402,475.

Samuel B. Hale went to Buenos Ayres in 1828 as a banker under the auspices of the Messrs. Lawrence, of Boston, and died a few days ago, leaving a fortune of \$15,000,000. He was a pioneer in the South American trade, and of late years became interested in sheep and cattle ranches.

A City of Mexico special to the Boston *Herald* says that the Mexican Central Company have signed a contract with the Government to deepen the bar at Port Tampico, making it the best on the Gulf, and aiming a heavy blow at the supremacy of the port of Vera Cruz.

The probable profits on the big Joggins raft, towed from Nova Scotia to this city, are estimated as follows: The piles are worth 5 cents per foot in New York, or say \$2 each. They cost 60 cents each at the point of shipment. An ordinary schooner will carry 500 or more in a cargo at a freight of \$1 each stick, or \$1.60 laid down in New York. The 22,000 sticks in the raft would afford cargoes to 44 vessels and a freight of \$21,000. The actual cost of the piles on the shore is \$13,000. They will realize \$44,000. That gives a profit of \$9000 if shipped by the vessels. Competent authorities say the whole cost of construction and towing will include \$10,000, thus leaving a profit of at least \$21,000.

The New York Cotton Exchange has issued its first official statement of the cotton crop of the United States. The following is a summary:

	1887-88. Bales.	1886-87. Bales.
Total port receipts.....	5,612,448	5,301,532
Net overland movement (including to Canada).....	1,001,261	820,969
Takings by Southern mills from the interior.....	433,124	377,184
Total crop.....	7,046,833	6,499,585

The crop last year was the largest ever grown in America, being 547,248 bales in excess of the previous one and 96,000 greater than the remarkable crop of 1882-83.

The Dominion fisheries is a subject exciting special interest in Canada in the prospect that important disclosures respecting their management will take place at the coming session of Parliament. The report for 1887, only now made public, shows a slight falling off in the catch of last year, as compared with 1886. The total value of the fisheries in 1887 was \$18,386,103, divided by provinces as follows: Nova Scotia, \$8,379,782; New Brunswick, \$3,559,506; British Columbia,

\$1,974,887; Quebec, \$1,773,567; Ontario, \$1,531,849; Prince Edward Island, \$1,037,425; Manitoba and Northwest Territories, \$129,084. As compared with 1886, there was a decrease of \$293,184. The total number of men employed in the fisheries was 59,933; number of vessels, 1168, aggregating 44,485 tons and valued at \$1,989,840. Altogether there is a capital of \$6,748,840 invested in the fishing industry.

The Massachusetts Institute of Technology is expected to have a membership this year of at least 300 students in the freshmen class, against 270 last year.

The Allegheny County Court House, in Pittsburgh, has been completed at a cost of \$2,268,000. Norcross Brothers, of Boston, were the contractors. There are 2500 electric lights in the building. The natural gas fire grates number 38. They are of every variety, the imitation logs and tiles being odd and unusual. In the cellar is a battery of 9 boilers to furnish additional heat and manufacture the electricity for light and call bells. The granite used in the walls and tower measures 260,651 feet; the granite ashlar 87,346 feet, the marble wainscoting 8796 feet, 5515 feet of marble carving, and 157,222 feet of foundation stone. There are over 15,000,000 brick in the structure, 28,197 square feet of plate glass, and many hundred tons of iron.

The name of Paso del Norte, the important railway center on the Mexican border, has been changed to City of Juarez. It is now emerging from the adobe period of its history.

The followers of the exiled King Maletoa, in Samoa, are in arms against German domination in that island, to the number of 3000, but resistance is futile. The island is doubtless destined to be the center of German jurisdiction in the Pacific. The exports and imports of the islands through German traders are far greater than those of all other nationalities combined, and the German tonnage also surpasses the aggregate of all other countries.

Howard Potter, of the firm of Brown Brothers, in Wall street, claims one-fourth interest in the Couch estate in Chicago, valued at \$4,000,000, and the case is before Judge Gresham.

Western New York promises a great apple crop, Niagara County alone contributing 1,000,000 barrels.

Agriculturists in the United States find that their profits, taken year after year, are narrowing down. The last annual report of the Bureau of Statistics shows the export prices of agricultural products for decennial periods as follows:

	1867.	1877.	1887.
Corn per bushel.....	\$1.00	\$0.58	\$0.47
Wheat, per bushel.....	1.27	1.16	.89
Flour, per barrel.....	8.84	6.48	4.51
Cotton, per pound.....	.30	.11	.09
Bacon and hams, per pound.....	.12	.10	.07
Lard, per pound.....	.14	.10	.07
Pork, salted, per pound.....	.13	.09	.06
Beef, salted, per pound.....	.12	.07	.05
Butter, per pound.....	.24	.20	.15

As concerns grain, low prices may be ascribed to the competition of India and South America. Lard and dairy products have suffered severely from adulteration. Both France and Germany have discriminated against American pork. Another explanation is found in the fact that cheaply run "tramp steamers" scour the globe in search of the cheapest markets. Thus, the ports of Russia, India, South America and Australia are every year brought into closer connection with the main central points of consumption, to the disadvantage of American farmers.

A resident of Turk's Island, West Indies, proposes to build a schooner to make trading voyages between the port of

Hayti, San Domingo and Turk's Island and New York. The owner intends to import goods from New York, and receive them at Turk's Island in bond, and thence forward them to such point as may seem desirable.

The brick yards at Haverstraw and other points on the Hudson River were deluged with water, suspending operations.

The exports of machinery from the port of New York during August were valued at \$327,876.

Complaints are frequently made to the Treasury Department of alleged erroneous reappraisements of imported merchandise said to be due to the selection as merchant appraisers of persons who are not familiar with the value and character of the merchandise appraised. In order to obviate further complaint on this score the Department has amended the customs regulations so as to require the merchant selected for that service to make oath that he is familiar with the character and value of the merchandise to be appraised.

Yellow fever causes much consternation in some parts of the South. At Jacksonville there is no improvement. At Memphis only mail cars are permitted to enter from the infected cities. Decatur, Ala., is almost depopulated. At Montgomery troops are enforcing the quarantine. New York responds liberally to the call from Jacksonville by subscribing some \$80,000, besides forwarding large quantities of provisions and general supplies.

A training ship for Philadelphia has been secured for Philadelphia through the influence of prominent business men in that city, and the Government ship *Jamestown* will be fitted up for instruction in practical navigation. The City Council will be asked to appropriate \$11,000 for its maintenance.

In real estate and banking circles in this city a profound sensation was caused by the discovery that Bedell, a long trusted clerk in the law office of Barlow, Laroque & Shipman, had obtained \$264,000 on bogus mortgages. The amount is thus apportioned: Farmers' Loan and Trust Company, \$109,500; Herman Koob & Co., \$17,000; Robert Center, \$43,000; J. Egmont Schermerhorn, \$58,500; E. Sloan, \$30,500, and some other clients of the firm, \$6500. These parties expect that the lawyers will make their losses good; the lawyers, in turn, will seek reimbursement from the Broadway Bank, on the around that the bank is responsible for money paid on forged indorsements. The bank, in turn, may look to Bedell and the notary, Henry, who is implicated in the various transactions.

On the 17th inst. Charles A. Pillsbury & Co., of Minneapolis, Minn., the largest flour-milling firm in the world, divided \$40,000 among their employees, in pursuance of a profit-sharing system adopted four years ago. For two years there were no profits to divide, but the past year witnessed a change, large returns were received and the firm have thus been enabled to show their good faith. Few concerns have ever distributed among their employees a larger gross annual amount as their share of profits.

West Superior, in Wisconsin, is among those cities in the Northwest which aspire to control the course of trade in that direction. She thinks she has gained a point through the construction of the Eastern Railway of Minnesota now nearing completion. The editor of the *Inter-Ocean* says: "That territory in the Northwest, which must eventually divide its business at least between the cities at the head of Lake Superior and the city at the heel of Lake Michigan, is as large in

area as ten Englands, and capable of maintaining without poverty 100,000,000 people. It will, on a moderate estimate, within the next cycle of ten years, contain 6,000,000 of people, capable of supporting with the produce of its own soil the Twin Cities with 500,000 inhabitants, and Twin Cities at the head of Lake Superior with a population of 250,000. Our development will be somewhat retarded at the start by the enormous powers of absorption of St. Paul and Minneapolis. But eventually our growth will astonish and in a large measure supersede theirs."

The sudden collapse of paper money in Peru forms the subject of an interesting communication from Consul Brent. The calamitous termination of the war with Chili so far impaired confidence in the ability of the government to redeem its notes that the purchasing power of paper money dropped to about one-twentieth of that of silver. Nevertheless, up to within a year the absence of other circulating mediums caused the paper to be retained in use, although the fall in its exchangeable value had brought ruin to numbers of people whose means were represented by it. At the present time, however, paper money is virtually repudiated in all business transactions not directly connected with the government. It is of value only in paying duties to the extent of ten per cent. It is estimated that there were 60,000,000 paper sols in circulation or in private hands. This sum was equivalent to 2,000,000 silver sols, and in the course of week was practically lost. Such a blow to a nation in such financial straits as Peru is hardly conceivable abroad. Numbers of families in Callao and Lima for a time were unable to buy the necessities of life.

The recent report that the Rhode Island coal mines have been purchased by the Worcester Iron Works, of Worcester, Mass., has been confirmed. It is stated that the mines are to be opened once more, new and improved machinery is to be employed in mining, and the purchasers are sanguine that in their hands the enterprise can be made profitable.

D. W. C. Carroll, of Pittsburgh, and Morris and Karttrel, of Chicago, have closed contracts for the building of two iron viaducts for the city of Denver, Col., to cross the railroads in that city. One viaduct is to be 376 feet long and 32 feet high, and the other 785 feet long and 32 feet high. The viaducts are to be made of structural iron, including the approaches. The viaducts cost \$97,000 and the approaches \$21,000 additional.

The New Orleans *Times-Democrat* says: "The following is the assessment of several Southern States during the census year and for 1887-88. The assessment now being made will show a still larger increase:

	1887-88	1879-80
Alabama.....	\$214,925,869	\$117,486,181
Arkansas.....	148,868,206	86,409,364
Florida.....	84,860,584	29,471,618
Georgia.....	841,504,921	235,650,530
Kentucky.....	488,491,690	318,087,875
Louisiana.....	221,500,000	158,587,495
Mississippi.....	120,887,254	106,594,708
North Carolina.....	210,035,453	156,100,202
South Carolina.....	141,495,056	132,027,986
Tennessee.....	239,750,000	211,768,538
Texas.....	650,412,401	304,493,163
Virginia.....	374,043,388	308,455,135
Total....	\$3,240,774,722	\$2,164,792,795

Nearly 11,000 tons of henequin have been imported into the United States from Mexico within the last three months.

It is reported that a syndicate has been formed by Governor Gordon, Henry W. Grady, and others, of Atlanta, Ga., and John H. Inman, Calvin Brice, General Samuel Thomas, Dr. Norvin Green, and others of this State, for the purpose of building a city at Rockmart, Ga., and developing the slate and marble quarries

there. The slate quarries on which the syndicate have an option are valued at \$10,000,000. The property cost the syndicate \$400,000 in cash and \$4,000,000 in stock.

The Lehigh Valley Transportation Company, of Buffalo, have just contracted for two propellers to be built by the Globe Iron Works, Cleveland, which are to be finished by the opening of navigation next season. Each vessel will be 308 feet over all, 290 feet keel, 40 feet beam and 25½ feet hold. Each will carry four masts and the engines and boilers will be near the middle of the ship.

The port of Beyrout, the financial center of Syria, midway between Smyrna and Port Said, is to be made a harbor of refuge for vessels navigating that part of the Mediterranean under an imperial concession, and the work is to be pushed rapidly to completion. Jetties are to be built which will form an inner harbor of 56 acres, with wharves, storehouses, tramways, &c. The work will cost \$1,200,000 and it must be completed within five years.

The steamers plying between New York and Vera Cruz via Havana will shorten their time to 8½ days between the two ports, making the round trip one week less than heretofore, greatly to the advantage of traders.

The Cunard steamer *Etruria* once more beats the record, having arrived at this port from Liverpool on Saturday, after a passage of 6 days 1 hour and 50 minutes—the best time ever made by a transatlantic vessel. The *Etruria* had previously held a record of the quickest ocean voyage—6 days 1 hour and 55 minutes. The vessel left Queenstown on Sunday, September 16, at 1.15 p. m. On the first day she made 437 knots; on the second day, with fair weather and a moderate breeze, she covered 465 knots; on the third day, despite a westerly swell, 456 knots were passed, and with moderate winds and fine weather on the fourth day 490 knots were left behind. On the fifth day, despite two hours of fog in the morning, she again covered 490 knots, and on the sixth day, with everything favorable, only 455 knots were placed to her credit. The vessel's average daily run was 460 knots, and per hour she averaged 19.2 knots.

A rapid transit scheme for cattle in palace cars from the Western plains to the seaboard has been inaugurated by a New York company, who promise to deliver stock in the market in less than 120 hours from the Idaho ranges, 2500 miles distant. The animals are fed and watered *en route*.

Traffic between Vera Cruz and the Mexican capital is suspended for at least a fortnight, on account of the destruction by floods.

How Norwegians are able to compete successfully in the trade with the United States and even find profitable employment in the maritime provinces of the Dominion is easily explained. The first cost of a Norwegian vessel is about one-half of the cost of an American vessel, and the crews employed receive about \$10 a month. Naturally not a few Norwegian seamen seek to better their condition on this side of the Atlantic.

Trials of Rapid Firing Guns.—A report has just been made to the British War Office upon the experiments recently carried out with the Maxim gun at 600 and 800 yards, in comparison with fire from Martini-Henry rifles. At 600 yards 15 men, all first or second class shots, fired ten volleys and made 52 per cent. of hits in 3 minutes 36 seconds, while the Maxim, firing the same number of rounds at the same targets, made 81.56 per cent. of hits in 2 minutes 36 seconds. At 800 yards the results were: 15 Mar-

tini-Henrys, 40.66 per cent. of hits in 3 minutes 40 seconds; Maxim, 80 per cent in 1 minute 30 seconds. The targets were arranged so that the volleys fired by the men were directed alternately a quarter right and a quarter left, the intervals between the targets being 12 yards; the Maxim fired 15 shots alternately on each target. Further experiments are to be made at unknown distances, and as nearly as possible under service conditions, at ranges between 1000 and 1200 yards; and on this occasion the new service rifle, with dial sight, is to be tested.

Recent Treasury Decisions.

The Secretary of the Treasury has issued the following decisions under the customs laws affecting metals:

DUTY ON "REMELTING STEEL."

On an appeal from assessment of duty at the rate of 45 per cent. ad valorem on certain so-called "remelting steel" claimed to be dutiable at 20 per cent. ad valorem, as unwrought metal, or at ⅓ cent per pound by similitude to pig iron, spiegeleisen, wrought and cast scrap iron and scrap steel, or at not more than 35 per cent. ad valorem, under the provision for iron in slabs, blooms, loops, &c. The Department says: "From the special report of the appraiser, it appears that the merchandise in question consists of the best quality of Bessemer steel slabs or cakes, intended for use in the manufacture of finished steel plates, sheets, or bars, and that it was returned and assessed with duty as steel in slabs, under the provision for 'steel ingots, * * * and slabs, by whatever process made, * * * valued at 4 cents a pound or less.' The assessment of 45 per cent. is affirmed."

COVERED DRESS STEELS.

The appellants claim that the merchandise in question is dutiable either at 3½ cents per pound, as steel strips valued over 10 cents per pound, or at 35 per cent. ad valorem. As the merchandise is admittedly an article composed in part of steel, the Department is of opinion that it was properly classified, imposing duty at the rate of 45 per cent. as manufactures of steel and cotton.

DUTY ON LARDING NEEDLES.

Under a claim of appellants on larding needles dutiable at 20 per cent. ad valorem the Department says: "It appears, from the special report of the appraiser, that the articles in question are in no sense needles, but consist of what are commercially known as 'larding pins,' the same being conical in shape, made wholly of metal, and varying in length from 6¼ inches to 9¼ inches, each having one of its ends very finely pointed and sharpened and its other end broad and hollow, for the purpose of receiving strips of lard, which, by use of these pins, are passed into and deposited in meats preparatory to cooking, the process being termed 'larding.' In the opinion of the Department these articles, which are used for culinary purposes only, and which are not either commercially or otherwise known as 'needles,' are liable to the rate of duty 45 per cent. ad valorem assessed under the provision for 'manufactures, articles or wares, * * * composed wholly or in part of iron.'"

CHAIN LINKS.

1. Certain links with movable bolts, for the adjustment (by shortening or lengthening) of chains, and which are first forged and then finished by boring, &c., and subsequently japanned or galvanized, are not forgings of iron within the meaning of the tariff, but are dutiable as manufactures of iron not otherwise provided for, under T. I., 216. (Letter to Collector of Customs at New York, September 3, 1888.)

MANUFACTURING.

Iron and Steel.

Operations have been resumed in the socket department of the works of the Pittsburgh Tube Company, at Pittsburgh. As soon as enough stock is secured the balance of the works will resume operations.

Last week there was shipped from the works of the National Tube Works Company, at McKeesport, Pa., the last of a large order for the City Water Works, at Carson City, Nev. The contract required the use of 28 cars to transport the pipe. Most of it was 24 inches in diameter.

The new sheet mill just added to the extensive plant of the Standard Iron Company, at Bridgeport, Ohio, was successfully put into operation on Monday, the 17th inst. The three-high plate mill now in course of construction will be completed and ready for operation about October 1 next. The mills were built by the Lewis Foundry and Machine Company, Limited, of Pittsburgh, Pa.

M. V. Smith, metallurgical engineer, of Pittsburgh, has just been appointed consulting engineer for the Minnesota Car Company, of Duluth, Minn., with headquarters in Pittsburgh. This new company is composed principally of capitalists from Richmond, Va., the president being John Anderson, of the Tredegar Company. The capital is \$400,000, all of which has been paid in. The plant will consist of a rolling mill with two trains of rolls, one 10-inch and one 18-inch, machine shops, foundry and car works having a capacity of 30 cars per day. Ground has already been secured, and work on the new buildings will be commenced at an early date. The bulk of the machinery will be supplied by Pittsburgh manufacturers.

The Carrie Furnace Company, of Pittsburgh, have decided to erect another blast furnace at Rankin Station, on the Baltimore and Ohio Railroad, adjacent to their present furnace located at that place. It will be 18 x 80 feet, and will have a capacity of about 200 tons per day. The contract for the erection of the furnace will probably be let the present week, and work will be commenced as soon after as possible.

Charles Huston & Sons, proprietors of the Lukens Rolling Mills, at Coatesville, Pa., have commenced the erection of a building for library purposes in the interest of their workmen and their families. Besides the library apartment it will have two classrooms, in which instruction in sewing will be given to the daughters of the workmen. A small library has been open to the men for some time, and this is now to be enlarged and benefits extended to the families.

The manufacturing industries of the Shenango Valley, Pa., are reported to be in better condition at the present time than for some years past. The following brief statement received from Wheatland, Pa., under date of the 19th inst., gives the condition of the various enterprises on that date, as follows: "Greenville mill in all departments is on double; Sharpsville, with one or two exceptions, all her blast furnaces in full blast; Sharon, P. L. Kimberly & Co.'s mills and furnaces pushed with orders; also the Sharon Iron Works working full with large orders ahead; Stewart Iron Company mill with 13 furnaces making a fine quality of steel and rolled billets, one blast furnace on, the other repairing; foundries all working full; Wheatland still idle, but with bright prospects for a glorious future. At West Middlesex one furnace making an excellent quality of Bessemer iron and the other to be put in operation as soon as possible.

The manufacturers say that they have orders enough to keep the mills running full until next fall."

The Helmbacher Forge and Rolling Mills Company have not as yet reorganized since the old board of directors was re-elected at the stockholders' meeting—at any rate they had not up to last Monday. The works were idle during the early part of the week to admit of repairs to engines, &c., and were to restart as soon as these were completed.—*Age of Steel, St. Louis.*

Work on the new blast furnace of the Gadsden Furnace Company, at Gadsden, Ala., is progressing rapidly, and it is expected to be ready for blast by October 1 next. It will have a capacity of 100 tons per day.

The nail factory of the Laughlin Nail Company, at Wheeling, W. Va., continues in constant operation, the company finding a ready market for their product as fast as produced. Their factory is next to the largest in the world, containing 220 nail machines.

In our issue of last week we made mention of the fact that the Wayne Iron and Steel Works, of Brown & Co., at Pittsburgh, were closed down in all departments on account of a labor dispute. The trouble has since been amicably arranged and the plant is again in operation in all departments.

The Lloyd-Booth Company, proprietors of the Falcon Foundry and Machine Works, at Youngstown, Ohio, have purchased the machinery that has already been erected in the partially completed rolling mill at Bowling Green, Ohio, and will remove it to Youngstown and scrap it. The mill was to have been built by parties from Youngstown and others interested in the rolling mill at Portsmouth, part of which was to be used at Bowling Green. The citizens of Bowling Green offered a bonus if the mill was ready to turn out iron at a certain time. Part of the buildings were erected, when a storm blew the structure down. This discouraged the owners, and as they would not rebuild in time to claim the bonus the project fell through. The plant was sold at sheriff's sale.

The steel department of the plant of the Pottsville Iron and Steel Company, at Pottsville, Pa., which has been idle for about two months, has resumed operations, giving employment to about 90 men. All departments of these works, consisting of rolling mill, puddling mill and steel department, are being operated to their utmost capacity.

Clinton Furnace at Pittsburgh, formerly owned by Graff, Bennett & Co., and which has been idle since the suspension of that firm in the early part of the year, was blown in again on Monday the 17th inst. The syndicate of creditors which purchased the plant of the firm will operate it as soon as a sufficient supply of pig iron is obtained. The Clinton Rolling Mill, situated in close proximity to the furnace, will also be started up. The resumption of operations by this furnace leaves but three idle blast furnaces in Allegheny County at the present time, all of which are undergoing repairs. There are the Edith of the Edith Furnace Company, Lucy No. 2 of Carnegie Brothers & Co., Limited, and Soho of the Moorhead-McCleane Company.

One of the Musconetcong furnaces at Stanhope, N. J., went into blast on the 17th inst.

On Monday, the 17th inst., the heaviest casting ever made by the Pittsburgh Steel Casting Company was successfully run at the works of that company in Pittsburgh. This was the pouring of the stem post of the warship Maine, now in course of construction at the Brooklyn Navy Yard. It is an L-shaped affair, the two arms measuring respectively 26 and 13 feet, portions of the casting being 42 inches thick. This heaviest portion is to act as a ram when upon the bow of the Maine. To fill the mold, 11 tons of steel were required, and the finished casting will weigh about 18,000 pounds. The length of the longest arm of the casting is 26 feet, that of the shortest is 13 feet 10 inches. It is 18 inches in width, and varies from a little over an inch to 42 inches in thickness. It must stand a Government test of 60,000 pounds tensile strength to the square inch, and an elongation of 10 per cent. in 8 inches. A piece of the cold metal an inch square must be bent at an angle of 90 degrees without fracture. The casting will be removed from the mold the present week, and will then be placed in an annealing furnace. A Government test will be made shortly afterward, and if it proves satisfactory it will then be delivered to the Government. The stern post and rudder for the Maine will also be cast by this firm in the course of a few weeks. The former will weigh but little less than the stem post, while the rudder will weigh about 14,000 pounds.

Machinery.

The Wheelock Engine Company, of Worcester, Mass., have been compelled to operate their works night and day to keep pace with their orders. Among their recent shipments are a 200 horse-power engine to the Linseed Oil Works, Sioux City, Iowa, and one of the same size to the Gleason Knitting and Mfg. Company, Seneca Falls, N. Y., and 150 horse-power engine to the B. Shoninger Company, New Haven, Conn. They are engaged on a large amount of repair work, including a good order for the Agawam Paper Company, Miltineague, Mass.

The plant of the New Process Twist Drill Company, at Taunton, Mass., has been bought by P. H. Corr and others, who will assume all liabilities and form a new company. The price paid was \$5000. It is stated that the new company will at once proceed to put the works in operation again.

The Ranken & Fritsch Foundry and Machine Company have filed articles of incorporation in the recorder's office, at St. Louis, with a capital of \$150,000. The new company are composed principally of the old stockholders of the Smith, Beggs & Ranken Machine Company, whose failure was noted some months ago.

The Standard Underground Cable Company, of Pittsburgh, have closed two large contracts for electric-light cables for Chicago. One contract was made with Prof. J. P. Barrett, superintendent of the Electrical Department of Chicago, for 5 miles of electric light cable, which will connect with the municipal light station of that city and distribute the current to 65 arc lamps, each having a lighting capacity of 2000 candle-power. The other contract is to furnish 50,000 feet of cable for the Consumers' Electric Cable Company, of the West Side, Chicago. The incandescent electric light will be used in the latter place, and the Westinghouse Electric Company have secured the contract for furnishing the lamps.

The Phoenix Iron Works, of Meadville, Pa., under date of the 17th inst., writes us as follows: "We are building an addition to our machine shop building 100 x 40 feet, in which will be located our blacksmith shop and erecting shop, all of the present building, including space now occupied by blacksmith shop and office, will be thrown into the machine shop proper. We have been obliged to get more room and put in additional machinery to keep up with our orders for our new

automatic cut-off engine. We expect also to increase our boiler shop facilities in the near future, as we are now crowded beyond our present facilities. We are also building a new office and drafting-room, said building will be 25 x 50. All the above will be substantial brick buildings."

The Wilson Mfg. Company was recently incorporated at Chicago, with a capital of \$300,000, for the purpose of manufacturing automatic regulating valves, faucets, &c. The incorporators are E. F. Brown, Jr., Robert W. Clarke and F. C. Rutan. Also, the Oregon Foundry Company, Oregon, Ill., with a capital of \$3000, by Frederick G. Jones, Benjamin F. Sheets and R. A. Austin.

The Hughes Steam Pump Co., of Cleveland, Ohio, have just completed the boilers and pumping machinery for the Salisbury Water Company, of Salisbury, Md. The pumping engine is of the compound duplex non-condensing type and has a capacity of 500,000 gallons per diem.

The Jeffrey Mfg. Company, of Columbus, Ohio, have made shipments of their Coal Mining Machinery and Power Coal Drills, recently, as follows: Reinecke Coal Co., Madisonville, Ky., One Power Drill; Cherokee & Pittsburgh Coal Mining Co., Pittsburgh, Kansas, Two Mining machines and One Power Drill; Canon City Coal Co., Brookside, Col., One Power Drill; Coal Bluff Mining Co., Clay City, Ind., One Mining Machine; Union Pacific Coal Co., Rock Springs, Wyo., Four Mining Machines. (These are in addition to the eight now in use at their mine, No. 4.) Sunnyside Coal Co., Evansville, Ind., Three Coal Drills; San Pedro Coal and Coke Co., Carthage, New Mexico, Two Power Drills; Sand Coulee Coal Co., Great Falls, Montana, Two Mining Machines; Spring Valley Coal Co., Spring Valley, Ill., Two Mining Machines.

The Hill Clutch Works of Cleveland, Ohio, report recent sales to E. P. Allis & Co., Brush Electric Company, Niles Tool Works, Walker Mfg. Company, Wm. Tod & Co., Geo. V. Cresson, Lane & Bodley and Fraser & Chalmers. They have also in hand complete power plants for the Oakland Electric Light Company, Cal.; Huntington Electric Light Company, W. Va.; St. Paul Gas Company, Electric Light Company, Helena, Mon. These companies report that they are working to the utmost limit of their capacity night and day, and are constantly enlarging their facilities to keep pace with their increasing trade.

Among the new factories being put up in the South is one under construction known as the Eufaula Cotton Mills, at Eufaula, Ala. It is to contain about 8000 spindles and 240 looms. The machinery is being constructed by the Lowell Machine Shop, of Lowell, Mass., and the belting will be supplied by the Page Belting Company of Concord, N. H.

The Washburn & Moen Mfg. Company shipped recently to the North Hudson County Railway Company at Hoboken, N. J., 13,000 feet of 1½-inch steel rope on one reel. The rope weighed 50,144 pounds.

Hardware.

Besides the introduction of Crude Oil as a fuel in their works, the St. Louis Shovel Company, St. Louis, Mo., have put in additional machinery which will give them an increased product, making their daily output 200 dozen Shovels, Spades and Scoops.

The Syracuse Forging and Gun Company, Syracuse, N. Y., whose works were partially destroyed June 2 by fire, have restored the works and are again in active operation, having had a delay in the progress of the business of about two

months. The wheel plant of this company, which sustained severe damage by the fire mentioned, is again in running order, and the company are now prepared to receive orders and to supply the large demand which they had established before the fire.

Jewett & Hatheway, Bridgeport, Conn., have begun the manufacture of sheet metal goods, patented novelties, light hardware, wood and metal patterns, dies, &c., corner of South avenue and Water street.

The Perkins Specialty Lock, Cleveland, Ohio, referring to the fact that the increasing demand for their goods has necessitated the extension of their manufacturing facilities, state that their company will hereafter be known as the Perkins Lock Mfg. Company, and allude to their increased capital and enlarged manufacturing facilities.

The Hollenbeck Lock and Knob Company, until June last in Syracuse, have completed new works in Jordan, N. Y., to which they have removed, and where they will continue the manufacture of hardware specialties. The new plant embraces a four-story structure, 70 x 50 feet, and adjoining foundry, 40 x 70 feet, with an annex for jappanning purposes, 30 x 20 feet. The first floor includes the offices, sample and shipping department, as well as machine and iron rooms. The second floor is occupied as a brass foundry, and assembling stock and pattern shops; the third floor being used for wood-working and varnishing, and the basement for polishing, coloring and lacquering. These works are located on the stream known as the outlet of Skanateles Lake, which furnishes a never-failing supply of power.

Henry Seymour Cutlery Company, Holyoke, Mass., have recently erected an addition to their factory, 120 x 30 feet, to accommodate their increasing business. They report that sales for eight months of the year 1888 show an increase of 10 per cent. over corresponding time last year, with an increase also in export trade. They refer to the ruling of the Secretary of the Treasury, placing sheep shears under manufactures of cutlery and 35 per cent. duty, instead of keeping them as they have been heretofore as manufactures of steel at a duty of 45 per cent., as affecting the sale of the goods largely the past season.

Miscellaneous.

A certificate of incorporation has been issued to the Rush Run Coal and Coke Company. The principal office is to be at Staunton, Va. The sum of \$20,000 has been subscribed to the capital stock, \$2000 of which have been paid in. The privilege of increasing the stock to \$500,000 is reserved. Shares are \$100 each and are held by F. Harrold, Fayette county; J. F. Effinger, W. P. Tames, A. S. Lara, Staunton, Va.; E. C. Best, Ronceverte, West Va., and C. M. Liggett, Lexington, Va.

A charter has been granted to the Pittsburgh Reduction Company, of Pittsburgh, with a capital stock of \$20,000. It is formed for the purpose of reducing bronzes and commercial alloys and manufacturing the same. The shareholders are: Alfred Hunt, H. W. Lash, Robert Scott and Millard Hunsicker, of Pittsburgh; George H. Clapp, of Edgeworth, and W. S. Sample, of Sewickley.

The new coaches in use on the New York and New England's Boston trains from this city are as handsome and comfortable cars as any run out of Providence. They are mounted on the Brunswick spoke wheels, have double windows, which keep out cold and dust, and Pullman curtains. The ceiling finish is in wood, and five double burners in each car

give plenty of illumination. The Hale & Kilburn shifting seat, with cherry frame, is used, upholstered in the ordinary coaches with plush, and in the smokers with rattan. Floors, sides and roof are filled with mineral wool which deadens the noise. The road has recently put on fifteen of these new cars.

The Rhode Island Locomotive Works have recently delivered nine ten-wheeled engines to the Chicago, Milwaukee and St. Paul Railway, two more were sent to-day, and four more remain before the order is filled. These are of the same style as others built for the St. Paul. This one railway alone have in use more than 200 locomotives from the Rhode Island Works.

Among recently authorized corporations in Illinois are the following: The Darby Lead Mining and Smelting Company, of East St. Louis; capital, \$500,000; incorporators, John C. Nial, George Frey, C. M. Sharpe and Walter H. Darby. The Peoria Cordage Company, at Peoria; capital \$200,000; incorporators, Martin Kingman, E. C. Heidrich, Charles A. Jamison and G. H. Schimpff. The Merchants' Arc Light and Power Company, of Chicago; capital, \$30,000; incorporators, William H. Collins, Joel W. Stevens and Benjamin Keigher. The Wills Horseshoe Company, of Chicago; capital, \$12,000; incorporators John H. Purdy, Harry A. Wills and Edward Williams. The American Gear Forging Company, of East St. Louis; capital, \$100,000; incorporators, O. Navins, Arthur W. Billings and William S. Long. The Clinton Electric Light, Heat and Power Company, of Clinton; capital, \$25,000; incorporators, Vespasian Warner, Clifton H. Moore, John Warner, Abner R. Phares, and Richard Butler. The Anchor Iron Car Roofing Company, of East St. Louis; capital, \$50,000; incorporators, H. D. Sexton, Henry O'Hara, and Royal J. Westney. The Galena Electric Light Company, of Galena; capital, \$10,000; incorporators, John A. Mensell, August Reid, and Benjamin Franklin Mensell.

Aerial Photography.—M. Arthur Batut, of Enlaure, Tarn, writes to *La Nature* that he has succeeded in taking aerial photographs by means of a kite. He finds that a kite 6 feet 6 inches high by 4 feet 7 inches wide will easily carry a photographic apparatus weighing 2.2 pounds. Our contemporary states that two photos taken by M. Batut at altitudes of about 250 and 330 feet respectively, although faint, give a plan of the house and farm at Enlaure, and may be looked upon as very successful first attempts.

It is rumored that the Argentine Government contemplates placing with our manufacturers contracts for 50 locomotives of various classes, and has already entered into agreements for the purchase of rails and coaches.

Paper pasted, gummed, or glued on to metal, especially if it has a bright surface, usually comes off on the slightest provocation, leaving the adhesive material on the back of the paper, with a surface bright and slippery as ice. The cheaper description of clock dials are printed on paper and then stuck on zinc, but for years the difficulty was to get the paper and metal to adhere. It is, however, said to be now overcome by dipping the metal into a strong and hot solution of washing soda, afterward scrubbing perfectly dry with a clean rag. Onion juice is then applied to the surface of the metal, and the label pasted and fixed in the ordinary way. It is said to be almost impossible to separate paper and metal thus joined. Probably metal show tablets might be successfully treated in the same manner.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, September 24, 1888.

Pig Iron.—The volume of business continues to shrink, most dealers reporting a very quiet week. A few of them are enjoying a steady demand for lots of 50 to 100 tons from small consumers, and one sale of a round lot of Lake Superior Charcoal Pig was made at \$21, four months. A demand for Charcoal, for Car-Wheel purposes, is among the possibilities of the near future, as Car-Wheel manufacturers are sounding the market in anticipation of orders for cars which are expected to be placed very shortly. Their inquiries run largely to high numbers, showing that Old Car-Wheels are scarce, and that consequently a greater proportion of Pig will be needed than usual. It is rumored that some of the Coke furnaces are soliciting business with more vigor than has been the case for several weeks, but this is alleged to be a canard put forth by buyers who hesitate to pay the advanced prices now ruling, and hope to work back to something like the old rates. Furnace companies using Lake Superior Ores state that higher prices for Pig are more likely to be realized than lower figures, because Ore is dearer and Coke seems strongly inclined to mount upward also. Agents for Southern Coke furnaces have been doing very little here of late, the high prices now asked interfering with new business. They fear that deliveries on old contracts which are now being made will be checked by the advance of yellow fever toward the Alabama Iron districts. Cash quotations, f.o.b. Chicago, are as follows: Lake Superior Charcoal all numbers, \$19.50 @ \$20.50; Alabama Car-Wheel, \$26.25; Jackson County Softeners, No. 1, \$18 @ \$18.50; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband) No. 1, \$19 @ \$20; other Ohio Scotch Irons, No. 1, \$18 @ \$19; Lake Superior Coke, No. 1, \$17.50 @ \$19; No. 2, \$16.50 @ \$17; No. 3, \$15.50 @ \$16; Southern Coke, No. 2, \$17.75 @ \$18; No. 2½ and Open Bright, \$17.25 @ \$17.50; No. 3, \$16.75; No. 1, Mill, \$16.50.

Bar and Structural Iron.—A very light demand is experienced for Bar Iron, but considerable business is expected shortly from car builders, who report increased inquiry from railroad companies. The mills are generally well filled with orders and little anxiety is manifested by their agents for new business. The usual quotation for mill lots of Common Iron is now 1.80¢, half extras, f.o.b. Chicago, and it would take very favorable specifications to shade this to any extent. For small lots from store jobbers are endeavoring to get 2¢, with 1.90¢ named as bottom to best buyers. Mill lots of Structural Iron are quoted as follows, f.o.b. Chicago: Angles, 2.25¢; Universal Plates, 2.25¢ @ 2.30¢; Tees, 2.50¢ @ 2.55¢; Beams and Channels, 3.40¢. Store prices of Angles are 2.40¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢.

Plates, Tubes, &c.—Business continues fair but little change occurring in volume or character. Heavy Sheets are firmer, and higher prices are asked in some cases, but Plates are without change. Tubes are hardly being maintained at the discount recently agreed upon. Quotations from store are as follows: Heavy Sheets Nos. 10 to 14, 2.6¢ @ 2.70¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 62½ ¢ off.

Sheet Iron.—A few inquiries are noted for mill lots, but it is very difficult to find a manufacturer able to make any deliveries this year. It is claimed that a market could be found here for a great deal more Sheet Iron if a supply was available. Manufacturers' agents state that the consumption for Roofing has grown enormously of late, and they believe that hereafter the Sheet-Iron trade will be more evenly distributed through the year. Some mills are quoting 3¢ @ 3.10¢, f.o.b. mill, for No. 27 for such deliveries as they can make, the higher rate being for earliest shipments. For December 3.10¢, Chicago, is named by a few mills to their regular customers. Jobbers' prices from store are 3.20¢ for No. 24, 3.30¢ for Nos. 25 and 26 and 3.40¢ for No. 27.

Galvanized Iron.—The activity in this branch is more pronounced than ever the past week, showing a decided gain in the volume of business transacted by manufacturers' agents. The demand covers all classes of consumers, but runs more particularly to high-grade material. Prices are firmer, and on some standard brands an advance of 5 ¢ has been made. Jobbers still quote small lots at 60 ¢ off for Juniata, and 60 ¢ and 5 ¢ off for Charcoal.

Merchant Steel.—The demand is irregular, some houses reporting a good business, while others have suffered a period of dullness. Combination prices from store are continued, as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢. Some of these prices are being shaded by works not in the combination.

Steel Rails.—Nothing has happened during the week to enliven business. A few railroad companies are talking of placing orders for 5000 to 10,000 tons, and some even ask quotations for next year's delivery, but they are slow to come to terms. The North Chicago Rolling Mill Company have resumed operations, but the Union Steel Company will shut down in a few days for lack of work. The Joliet Steel Company started up later than the others last spring, and will run longer before they clean up their order book. Quotations are nominally \$30 @ \$31.

Old Rails and Wheels.—Very few transactions in Old Iron Rails have come to light. One sale is reported at \$24, and another \$23.50. The exact condition of the Old Rail market is difficult to ascertain, but the impression is quite general that for the present, at least, the upward movement has culminated, though some of those interested are still talking higher prices. The supply has now overtaken the demand, and unless other markets advance it seems reasonable to expect a decline here to some extent. Short ends of Old Steel Rails have been sold at \$16.50, but long lengths are worth \$19 @ \$20. Old Car-wheels are very quiet, with \$19 @ \$19.50 nominal quotations.

Scrap.—Increasing inquiry for Wrought has run up the price, but this again has checked business, as consumers are indisposed to pay the advance asked by dealers. Steel Scrap is looking up a little, but Cast is still quiet. Quotations for carefully selected are as follows, per ton of 2000 lb.: No. 1 Forge or Railroad Shop, \$20.50 @ \$21; Track, \$20; No. 1 Mill, \$16; Tank and Pipe, \$13; Sheet, \$9.50; Horseshoes, \$20; Axles, \$26; Cast Machinery, \$15; Stove Plate, \$12; Cast Borings, \$9.50; Wrought Turnings, \$12.50; Axle Turnings, \$14.50; Coil and Leaf Steel, \$16 @ \$17; Locomotive Tires, \$17. Dealers offer \$14 for Mixed Country Scrap.

Hardware.—Continued improvement is reported in Heavy Hardware, but reports vary as before with regard to Shelf Hard-

ware, some houses stating that business is even dull, while others are having a most excellent trade. With Western agriculture in its present prosperous condition the general demand for Hardware ought to improve very soon, unless the influence of last year's failure of the crops is so far-reaching as to yet seriously affect the farming interest. Manufacturing consumers of Heavy Hardware are purchasing more freely. Wagon-makers' prospects are particularly bright, and wagon material is correspondingly active and firm. Nuts and Bolts are firmer in sympathy with dearer Iron. The market is bare of Stove Boards, and the jobbers are pushing the manufacturers vigorously for more rapid deliveries, meanwhile borrowing from one another. Prices are now firm at 50 ¢ and 10 ¢ off for Crystallized from store, and other kinds in proportion. In consequence of the advance in manufacturer's price of Zinc, full casks are now held at 6½¢, and smaller quantities at 6¼¢ @ 7¢. Shot has been marked up to \$1.45 per bag, and strictly half-and-half Solder to 18¢ per lb., in consequence of the higher price of Lead and Tin.

Nails.—Little is being done in large quantities, or even in carloads, but jobbers are having a good demand for sort-up lots. Nearly every order for Hardware now has Nails in it. Small lots are quoted from store at \$2.10 for Steel and \$2.05 for Wire, but these prices are being shaded to some extent. The project for the formation of a pool among the manufacturers of Cut Nails is reported to be progressing very favorably, and the signatures of but few more manufacturers are needed to make it operative. If they are not secured by the 1st of October every effort is to be made to have them by the 1st of November. Much importance is being attached to this scheme on account of the high character of the men who are promoting it, and the commanding influence of the works which they control. It is very certain that if the organization is perfected prices of Cut Nails will be marked up.

Barb Wire.—No change has occurred to brighten the prospect. Orders are small and prices are unremunerative. The nominal quotations are 3¢ for Painted and 3.75¢ for Galvanized, but concessions are made even for small lots.

Pig Lead.—The market is in the hands of speculators, who have run up the price from 4.80¢ to 4.90¢. These high prices are bringing out stocks from consumers, who have made sales of several hundred tons at about 4.85¢.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., September 25, 1888.

Pig Iron.—A very decided feeling of strength has been apparent during the past three weeks, and is daily becoming more general. Prices have scored a clean advance of 50¢ per ton, although there are some who are still supplying their regular trade at the old figures, but should the improvement continue it is quite evident the advance would become general. As to the future course of the market it is difficult to pass an opinion, although the feeling at the moment is one of undoubted strength. There is some evidence of a slight hesitancy in purchasing at the advance, and if sellers will be satisfied with the present improvement in prices it is liable to prove a permanent one, and any further pressure toward higher figures, for the present at least, is almost sure to result disastrously, consequently a conservative course is the one to be followed, and will probably be adopted. Overproduction is one of the greatest evils to be avoided, and if this is successfully done the future of the market is in a measure assured. At

the present time the demand averages pretty well up to the supply. Meanwhile sales are being made on the basis of \$18.50 @ \$19 for No. 1 Foundry, \$17.50 @ \$18 for No. 2 and \$16.50 for Gray Forge, although choice brands in some cases command a trifle more money.

Foreign Iron.—No transactions to report; prices are nominally as follows: \$20 @ \$20.50, c.i.f. duty paid, for Bessemer and \$26 @ \$26.50 for 20 % Spiegel.

Blooms.—A fair amount of business is being transacted and prices are firm at about the following quotations: Nail Slabs, \$29 @ \$29.50; Billets from \$30 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 @ "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29.50 @ \$30.50 for Nail Slabs; \$32.50 @ \$34 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—Quite a large trade is being done at about \$29 @ \$29.50 delivered. Inquiries are numerous, although generally at a little less than sellers are willing to take, consequently a number of orders are being held in abeyance, but holders do not seem inclined to shade their figures to any extent.

Bar Iron.—Trade in this department has been very large during the past two or three weeks, and the mills have been able to book a number of large and desirable orders, while some are well filled up to the end of November. Early deliveries are not obtainable except at full quoted rates, say 1.9¢ @ 1.95¢; although for good-sized orders 1.87½¢ might be accepted. Skelp has been somewhat active during the past week at 1.87½¢ @ 1.9¢, although bids are on the market at 1.85¢, but are not very anxiously sought after by sellers. The price of Bar Iron from store has been advanced from 1.9¢ to 2¢ per pound.

Plate and Tank Iron.—The mills all report a good business and indications point to a continuance for the next two months at least. Prices while not higher are quoted firm at about as follows: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—Trade is somewhat slow in this department, but mills are, to a certain extent, well filled with old contracts, and, with such small orders as are received daily, are able to work pretty well up to their capacity. Prices show no change and are quoted as follows: 2.10¢ @ 2.15¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The demand is a little slow, but stocks are not allowed to accumulate to any great extent, as mills are generally able to market what they make up without any serious trouble. Prices remain as last quoted—viz.:

Best Refined, Nos. 26, 27 and 28... 3¼ @ 3½¢
Best Refined, Nos. 18 to 25... 3 @ 3¼¢
Common, ¼¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28... 4¼ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25... 4 @ 4¼¢
Best Bloom Sheets, Nos. 16 to 21... 3¾ @ 3½¢
Blue Annealed... 2.8 @ 3¢
Best Bloom, Galvanized, discount... 62½¢
Common, discount... 67½¢

Merchant Steel.—The increased demand for the better grades of Steel continues to be the only feature. Prices remain unchanged, as follows: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Open-Hearth Ordinary Spring, 2.7¢ @ 2.9¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—There is no improvement of any kind in this department. Orders

are scarce, but mills are kept fairly busy on outside specialties. Prices are nominally \$29, at mill, but it is intimated that this figure could be shaded on good sized orders.

Old Rails.—No sales of any consequence to note. There are a number of Rails held in store here, but holders do not seem anxious to name figures—at least not for the present—although bids are on the market at from \$23 to \$23.50, which, however, is somewhat less than holders expect to realize.

Scrap Iron.—Occasionally orders for good round lots are heard of, but the bulk of the trade at the moment seems to be in small-sized orders at about the following figures, say \$20.50 @ \$21 for cargo lots; \$21.50 @ \$22 for carload lots, delivered, or for choice \$22.50 @ \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—Mills are all busy and are well filled up with orders, although prices, for some unknown reason, continue weak and drooping. Discounts are quoted as follows: Black Butt-Welded, 55¢; on Galvanized do., 45¢; on Black Lap-Welded, 65¢; on Galvanized do., 52½¢; on Boiler Tubes, 60¢.

Nails.—It is very difficult to find anything of interest either as regards amount of business or prices. Only a limited number of Nails are being sold, and on account of the extreme competition from outside points it is difficult to sell at a figure that pays for the handling. Lots from store are quoted at \$2, with the usual discount on carload lots.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts.,
CINCINNATI, September 24, 1888.

Pig Iron.—The market for Pig Iron here preserves its strength well, the recently published statistics fortifying producers in their positions. As was surmised a week ago, official statements for the month of August show a reduction of about 42,000 tons in stocks of Coke Iron and about 9000 tons in stocks of Charcoal Iron at the furnaces, and this reduction of stocks occurs at the same time that there has been an increased production of 10,000 tons, which is equivalent to an increased consumption of upward of 50,000 to 55,000 tons during the past nine months. But the fact that increased consumption is the rule at this season deprives the showing of much force which it might otherwise have. While the local market has been strong during the week the volume of business has been less; this is in part due to the retirement of a number of furnaces from the market, but at the same time buyers have not been importunate, yet inquiries have been frequent, the pulse, temperature and respiration of the market being accurately taken by all concerned. No very large sales have been recorded and the aggregate of small transactions has been less. Among the larger sales may be noted 2600 tons Southern Car-Wheel Iron at \$25, four months; 1000 tons No. 2 Southern Coke Foundry at \$16.50; 600 tons do. at the same rate, and 500 tons No. 2 Southern Forge at \$14.50. No. 1 Southern Forge has been sold at \$15.25 @ \$15.50, and about 600 tons Mottled Iron equivalent to \$13.50, cash, here. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1... \$17.50 @ \$18.50
Southern Coke, No. 2... 16.50 @ 17.50
Southern Coke, No. 3... 15.50 @ 16.10

Ohio Soft Stone Coal, No. 1... 17.00 @ 17.50
Ohio Soft Stone Coal, No. 2... 15.50 @ 16.00
Mahoning and Shenango Valley... 17.50 @ 18.50
Hanging Rock Charcoal, No. 1... 20.50 @ 22.50
Hanging Rock Charcoal, No. 2... 19.50 @ 22.0
Tennessee and Alabama Charcoal,
No. 1... 18.50 @ 19.50
Tennessee and Alabama Charcoal,
No. 2... 17.00 @ 18.00

Forge.

Strong Neutral Coke... 14.75 @ 15.25
Mottled Neutral Coke... 13.50 @ 14.00
No. 1 Mill Coke... 15.00 @ 15.50
No. 2 Mill Coke... 14.50 @ 15.00

Car-Wheel and Malleable Irons.

Southern Car-Wheel... 20.00 @ 23.00
Hanging Rock, Cold Blast... 22.00 @ 25.00
Lake Superior Car-Wheel and Malleable... 20.50 @ 21.50

Manufactured Iron.—The volume of business has been fair during the week, some new orders of moment being booked, and a firm tone has prevailed. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3½¢ @ 4½¢ @ lb.

Nails.—There has been a fair jobbing demand, which has been readily met at previous range of prices, but there has been some change in the discount allowed. Jobbing prices are based upon 12d @ 40d, which sell at \$2.10 @ keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2.10 and Steel Wire Nails at \$2.75 @ keg.

Old Material.—The market has apparently come to a halt. It is in a congested state, sellers having accumulated considerable stock at different points and demanding prices in excess of buyers' limits, have stopped the movement in this vicinity at least. Old Rails would probably sell at \$24, while sellers are not disposed to accept even \$25. Old Wheels are dull and nominally quotable at \$22, spot.

Cleveland.

CLEVELAND, September 24, 1888.

Iron Ore.—Sales of Bessemer Ore are reported at an average advance of 50¢ per ton over midsummer quotations. Transportation rates to lower lake ports have crept up to \$1.40 from Escanaba, \$1.60 from Marquette and \$1.85 from Ashland and Two Harbors. The tone of the market is certainly very firm at the advanced quotations, which are fully justified by the increased lake freights. The demand is excellent and many dealers report having declined orders that were thought to be in excess of the output of their mines. With the vessel interests steadily clamoring for higher carrying rates, mine owners have been even stronger than they would otherwise have been in their determination not to be driven into the position of having on hand, near the close of the season, large quantities of Ore already sold and obliged to be forwarded regardless of excessive freights. Scattering sales of Gogebic Bessemer have occurred during the past week at prices equivalent to \$5.35 @ \$5.45, f.o.b. cars Cleveland. Menominee Bessemer have sold at about \$5.40 and Red Hematites at \$5.25. The shipments for the season closely aggregate 3,250,000 tons, with a fair prospect of the output for 1888 reaching 4,000,000 tons.

Pig Iron.—The market is very active and the volume of business for the past week is probably quite equal to that of any preceding six days in August or September. Dealers would not, however, be surprised if business should be a little quiet for a month or six weeks. Producers of Bessemer Irons are not only well sold up, but have anticipated their output to such an extent that they will have practically nothing more to offer before the middle of November. Buyers, too, have purchased ahead of their immediate needs, and not very much is to be expected of them for a month or two. The situation is the natural result of the activity which has characterized the market since August 1st. The market

Detroit.

WILLIAM F. JARVIS & Co., under date of September 24, report as follows: There has been very little change in the market during the past week. Considerable business has been transacted, and no concessions have been made in any case. Prices have been very firm at the advance recently reported. The confidence that prices will be higher in the future is shown by the number of buyers that desire to purchase who are not consumers of Iron. This is further demonstrated by the action of some large consumers, who placed orders about 60 days ago for their wants during the next six or eight months, but who have purchased during the past week an additional quantity almost equal to the original purchases. We quote for the present as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @ \$20.50
Lake Superior Coke, all ore.....	19.75 @ 20.25
Lake Superior Coke, cinder mixed.....	18.50 @ 19.00
Standard Ohio Black Band.....	19.75 @ 20.25
Southern No. 2.....	17.75 @ 18.25
Southern Gray Forge.....	16.25 @ 16.75
Southern Silvery.....	17.00 @ 17.50
Jackson County (Ohio) Silvery.....	18.50 @ 19.00
Old Wheels.....	20.50 @ 21.50

New York.

Office of *The Iron Age*, 66 and 68 Duane street, New York, September 26, 1888.

American Pig.—Representatives of Southern Pig Iron producers have been watching with some solicitude the reports of the yellow fever scare in the South, and news from Birmingham particularly has been closely scanned. Until now no traces of the epidemic in that town have been reported, and the latest advices are encouraging. Any outbreak there followed by a panic would very seriously influence the Pig Iron markets of the whole country. Every day successfully passed lessens the danger, as we are approaching the first frost. Still the trade should closely scan the reports from that section for the next week or two. Our market has been quite active, the notable event being the sale by the Thomas Iron Company during the latter part of last week of Mill and Forge Irons to the aggregate of about 20,000 tons, to rolling mills, Pipe founders, Stove manufacturers, and engine and machine builders at the season prices, for delivery during the balance of year. Through these sales the output of the Thomas Iron Company must now be pretty well provided for. We hear of a purchase of 1400 tons of Southern No. 1 at \$18.10, though the majority of representatives hold at \$18.50 @ \$19 for moderate lots. A 500-ton lot of Southern No. 2 Foundry has been offered at \$16.50, tidewater. In Mill Iron we hear of a small sale of Northern Iron at a shade under \$16. The Southern furnace companies have generally agreed to the following change in the grading, which some have been working under for some time past. This new grading is to go into effect on October 1:

New Grade.	Old Grade.
No. 1 Foundry.....	No. 2 Foundry.
No. 2 Foundry.....	No. 2½ Foundry.
No. 3 Foundry.....	No. 1 Mill.
No. 1 Soft.....	Open Bright.
No. 2 Soft.....	Close Bright.
Silver Gray.....	Silver Gray.
Gray Forge.....	No. 2 Mill.
	Mottled.
	White.

This will do away with a good deal of confusion and will be welcomed by Southern furnace managers. We quote standard brands: No. 1 Northern Foundry, which is scarce, \$18 @ \$19; No. 2, which is more plentiful, \$17 @ \$17.50, and Gray Forge, \$16 @ \$16.50.

Scotch Pig.—High prices are checking the demand. We quote for moderate lots: Coltness, \$21.75 @ \$22, nominally; Shotts,

\$20.50 @ \$21; Langloan, \$20.50 @ \$20.75, and Dalmellington, \$20.25 @ \$20.50.

Spiegeleisen.—Some sales are reported for Western delivery at private terms. The market has advanced, and importers are now asking \$27.75 @ \$28 for English, steamer shipments, although no business has been done at these figures. Foreign Ferromanganese is held at \$54 @ \$54.50 nominally.

Plates.—An important circular has been issued by Carnegie, Phipps & Co., through their Eastern agent, H. L. Waterman, Mills Building, this city. The announcement is made that as Soft Steel Plate is taking the place of Iron for bridges, ship, tank and structural work generally they have decided to make prices for Sheared and Universal Rolled Plate of these grades as low as are quoted for Iron Plates for similar purposes. We quote Iron Tank, 2.1¢ @ 2.2¢; Shell, 2.3¢ @ 2.4¢; Steel Tank, 2.2¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.65¢ @ 2.75¢, and Fire-box, 3.5¢ @ 4¢.

Structural Iron.—The majority of manufacturers are fully employed, though current orders are for small quantities mainly. We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢.

Steel Rails.—Sales during the week by Eastern and Western mills foot up to about 18,000 tons in the aggregate, the bulk of the business being done by Western mills for Western roads. Inquiries are in the market almost exclusively by Western roads for winter and spring work, aggregating about 75,000 tons, 30,000 tons thereof being for one system. A part of them, probably, are in the nature of feelers; others are from roads which usually buy early and decide promptly whenever they have entered the market. It is not likely that the Eastern mills will touch any of this business, because relatively prices in Chicago are lower at \$30 there than \$28, which is the usual price now at Eastern mills. The first step must therefore be that the Western mills fill their order books at least partly. Some uncertainty exists among Rail-makers as to next year's business. All of them have worked off accumulations of cheap raw material pretty well and could not now replace Ore Pig, Spiegeleisen or Coke at the same low prices, although that point has not been seriously tested except in a few isolated cases. These circumstances would point to higher prices. On the other hand, many manufacturers are usually willing in order to secure a start on their order books to accept early contracts at close figures. An error crept into our report last week in regard to sales thus far for 1889. Up to September 1st, according to the official report the sales had aggregated 26,430 gross tons. We quote \$28 @ \$28.50, with rumors of sales for winter delivery at a shade under.

Blooms and Billets.—Very little is doing in Foreign which are quoted \$30.50 @ \$31 for sailer shipment, and \$31.50 @ \$31.75 for steamer shipment.

Wire Rods.—The market is dull at \$39.50 @ \$40 for small lots and no demand for large quantities.

Old Rails.—The position remains strong, the stock here having now dwindled down to less than 5000 tons, held by three strong parties. We note a sale of 2000 tons of T's from an American road at \$26.25, Pittsburgh, and of 6000 sold by an Eastern road at \$25.50, delivered at Ohio mills. A correspondent in Louisville writes of a sale of 1500 tons at \$24, spot cash, f.o.b. cars Cincinnati or East St. Louis, as the buyers may elect. The majority of the Eastern roads have now disposed of their holdings, and

what little there is here now could be swept away by one buyer. Holders ask \$25 for T's and \$26 for Double Heads. C.i.f. prices, by private cables, make foreign T's 70/ and Double Heads 75/, which would be equivalent to the figures quoted.

Old Steel Rails.—We note a sale of 1200 tons of Old Steel Rails delivered at Ohio points at \$20.

Scrap.—The market is quiet, holders asking \$21 for No. 1 from yard. We note a sale of 300 tons R.R. at \$23.50 delivered at Cleveland, and 100 tons of Axles at \$28.

Swedish Iron.—The market is quiet. We quote Rough Bars \$56. Store assortment, \$60 @ \$61, and Wire Rods \$53.50 @ \$54.

Fastenings.—Manufacturers are asking \$2.25, delivered, for Spikes. Dilworth, Porter & Co., are expected to resume on October 15th. Angle Bars are 2.05¢ @ 2.10¢.

Axles.—We quote Scrap Axles 2.15¢ @ 2.25¢, and Muck and Steel Axles 2.4¢ @ 2.5¢.

Financial.

While complaints come from some quarters that the fall trade is backward and hardly equal to expectations, there has been a general agreement that the business situation is satisfactory. Within the last few days, however, the Southern scourge has assumed a more threatening appearance, completely suspending traffic on important thoroughfares, until now it is reported New Orleans is not accessible by interior routes with any degree of certainty, except by way of Montgomery in Alabama, and even that route is threatened. Business in consequence is prostrated through a large section of country. It is inevitable therefore that traffic for a month or two must be seriously interrupted, until frost shall check the progress of disease. Several Northern railroads already refuse to receive freights from points below Charleston, and a telegram from Atlanta says it is probable the Memphis and New Orleans trains will be discontinued. Ex-President Norton, of the Louisville and Nashville Railroad Company, expresses the opinion that with the return of frost matters will soon resume their normal condition, and that Southern roads will suffer no material loss through the epidemic. Turning to the more cheerful aspects of the situation the important fact is announced by authority that an unprecedented corn crop is secured, equal to the enormous aggregate of 2,015,000,000 bushels; an increase of 559,000,000 bushels, or over 38 %, compared with 1887, and for the seven surplus States a gain of 520,000,000 bushels, or 66 %, the latter a gain of 60,000,000 bushels for the same group of States compared with the previous largest production in 1885. After a temporary decline of prices for wheat, in the absence of an export demand, wheat in Chicago touched the dollar mark, and millers at Duluth on Monday marked up wheat 4¢ per bushel, New York following with an advance. Wheat in this market again jumped on Tuesday, cash wheat or what is termed No. 2 Red selling at \$1.02, and flour again advanced, the best Minnesota selling at \$6.25¢ @ \$6.40¢. Corn was weak. Provisions were lower on yellow fever reports. Lard was excessively dull. Oil advanced sharply on buying orders. Cotton quiet at steady prices for spot stock. Advices from the Liverpool Exchange were that cotton-sheeted bales would be accepted as good delivery. Grocery jobbers reported that the early fall trade was the largest for some years. Coffee is disturbed by speculation. Sugars are firmly held.

The Stock Exchange market was subject to varying phases, following the extraordi-

any depression in St. Paul and reports that English shareholders were attempting to control the road. On Thursday it was announced that the Interstate Commerce Commission had decided that it cannot order the Burlington and Northern to advance its rates, even though they are unremunerative. The Chicago, St. Paul and Kansas City Road is also prohibited from further violating the fourth section of the Interstate law. On Friday a break occurred in Louisville and Nashville owing to free selling on the reports from the South of the spread of yellow fever. On Saturday there was more liberal selling of the grangers and the coal shares, but in the late trade the market partially recovered. On Monday there was again a lower tendency. On Tuesday the market was dull, closing firm.

United States bonds are quoted as follows:

U. S. 4½s, 1891, registered.....	107½
U. S. 4½s, 1891, coupon.....	107½
U. S. 4s, 1897, registered.....	128½
U. S. 4s, 1897, coupon.....	129½
U. S. currency 6s.....	121

The weekly bank statement showed a loss of nearly \$500,000 in surplus reserve, which now stands at \$11,943,625, against \$5,816,725 at the corresponding time last year, and \$9,079,875 in the second week of September, 1888. In loans there was a contraction of \$492,200. Specie showed an increase of \$826,400 and legal tenders decreased \$1,626,100, reflecting the continued movement of currency to interior points. Deposits decreased \$1,279,400. The large purchases of bonds by the Treasurer of late supplied the banks with all needed funds. The total amount of bonds purchased to date under the circular of April 17 is \$53,266,800, of which \$35,400,850 are 4s, and \$17,865,950 are 4½ per cents. The cost of the 4s was \$45,315,268, and of the 4½s \$19,183,895, making the total cost \$64,499,163. Notwithstanding these purchases there is still an excess in the receipts over the expenditures since the 1st inst. of \$15,000,000. Treasury purchases, together with heavy interest disbursements October 1 and Congressional appropriations, will go far toward providing money to meet the usual autumn demand. Money on call averages about 2%. The rates on time loans, most of which were made by trust companies and out-of-town institutions, were 4½ to 5½% for four to six months. Commercial paper was in abundant supply, and the demand was light. Rates were for 60 to 90 days' indorsed bills receivable 5½ to 6%, for first-class four months' commission house names 5½ to 6½% and longer dates 6 to 7½%.

Sterling exchange was lower; actual rates, \$4.84 @ \$4.88. With free cotton exports later in the season, the receipt of gold from Europe is not improbable.

The clearings of 38 cities for the week ending September 22 were \$1,113,797,755, against \$991,174,669 last year, an increase of 12.4%. Outside of New York the gain was 5.9%. New York increased 13.5; Boston, 2.3; Philadelphia, 4.3; Chicago, 13.9; St. Louis, 19.8; Kansas City, 12.5; Louisville, 24.7; Omaha, 13; Minneapolis, 7.7; Denver, 36.1, and Duluth, 36.6%. Cincinnati decreased 3.2; Milwaukee, 3.9; St. Paul, 7.7; Memphis, 36.9; Wichita, 24.4, and Norfolk, 23.8%. The gross earnings of 81 railroads from January 1 to July 31 show an increase of \$10,225,660, or 4%. The weekly reports for September indicate an increase varying from 2 to 3%.

The exports of specie from this port during the week were \$535,000, and the imports \$150,000. Since January 1 the amounts, respectively, are \$28,225,000 and \$6,589,000.

The imports of merchandise at this port during the week were valued at \$8,271,000, of which \$2,000,000 represents dry goods.

The total since January 1 is \$343,646,000, as compared with \$345,115,000 for the same time last year and \$318,872,000 in 1886. Exports for the week were \$6,773,000; total since January 1 \$211,940,000 as compared with \$225,795,000, for the same time last year.

The new bank organized by the hat trade in New York with a capital of \$250,000 is named the Empire State Bank. James W. Conrow was elected president.

The Philadelphia mint during the fiscal year ended June 30 struck off coinage pieces in numbers exceeding 88,000,000 and in value \$25,982,957.52, and the operations of the establishment yielded a profit of \$5,236,000 above the working expenses and exclusive of the profit on silver bullion purchased.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from September 17 to September 23, inclusive, and from January 1 to September 23, inclusive, were as follows:

Iron and Steel.			
	Sept. 17 to Sept. 23.	Jan. 1 to Sept. 23.	
	Tons.	Tons.	
Iron Ore: Bowering & A. & Co.	100	4,000

Coal Market.

The Anthracite Coal market is easier, and it is not probable the heavy business done of late will be continued in October. The large operators already show some disposition to curtail production, the output from the three mining districts having dropped during the week ended September 22 to 869,136 tons, which is a decrease of 66,000 compared with the previous week, Wyoming alone falling off nearly 50,000 tons. Nevertheless, the amount of Coal passing into consumers' hands is extraordinary as the companies as a rule have no large accumulations. Compared with the corresponding week last year, the output now reported is 256,000 tons larger, and since January 1 the excess is upward of 2,000,000 tons. The comparison by weeks since the climax of the season is as follows:

Week ended August 18.	920,922
Week ended August 25.	832,058
Week ended September 1.	844,665
Week ended September 8.	881,802
Week ended September 15.	935,523
Week ended September 22.	869,136

Broken Coal is accumulating, and the smallest Steam sizes are in excess, but for sizes most in demand prices are said to be firmly held. Quotations are as follows:

	Broken.	Egg.	Stove.	C'nuff.
Hard white ash.	\$4.15	\$4.40	\$4.65	\$4.55
Free white ash.	3.95	4.30	4.65	4.55

Pea is quoted \$2.75, but can be bought much lower, and fancy grades range about \$4.50 @ \$5. Lehigh, f.o.b. at loading ports: Lump, \$4.50; Broken, \$4.25; Egg and Stove, \$4.60; Chestnut, \$4.70.

The official Coal figures for August show a production of 4,097,000 tons, and 898,000 tons increase over August, 1887. This is the heaviest August output known, and, notwithstanding the great produc-

tion, the stock of Coal at tide decreased 307,000 tons during the month, showing that the market absorbed about 4,405,000 tons.

Bituminous Coal is being delivered freely on contracts, and business is done on the pool basis of \$3.50, alongside. Cumberland reports 70,000 tons for the week, and Clearfield 61,863 tons, which is an increase of 15,000 in shipments from these sources, compared with the same time last year.

Metal Market.

Copper.—At the time of our last report spot Chili Bars stood £95 in London, giving way to £94 the next day, but recovering to £100 yesterday, since when there is no change. Futures meanwhile temporarily gave way from £79 to £78. 15/, but are now £79 once more. Best Selected has been £80. 10/. Good merchantable brands improved from £77. 2/6 to £78. 5/ to-day. Total sales 1600 tons. Here very little has transpired. Consumers that may stand in need of Copper are supplied by the syndicate at 16½¢, while bears, to cover outstanding futures, have to pay 17½¢, which is also the figure for December delivery. There is some agitation in and out of Congress to put Ingot Copper on the free list. Whether anything will be done in that direction seems to us doubtful. The total output of ten Lake mines is given as under for the first eight months:

	1888. Tons.	1887. Tons.
Calumet and Hecla.....	19,313	20,688
Tamarack.....	5,001	2,737
Quincy.....	2,630	1,821
Atlantic.....	1,850	1,634
Oscuela.....	1,667	1,327
Franklin.....	1,463	1,607
Huron.....	949	487
Central.....	723	765
Copper Falls.....	487	380
Kearsage.....	72	...
Totals.....	34,155	31,426

The export of domestic Copper during the first seven months has been 22,740,924 lb, against same time last year, 8,247,368. The London *Economist*, in its last issue, prints an article which we reproduce in full:

THE PROFITS OF THE FRENCH SYNDICATE.—A correspondent, who writes with an intimate knowledge of the Copper market, has favored us with the subjoined estimate of the financial results, to the 1st inst., of the operations of the French syndicate. He thinks "they will prove rather a revelation to the public, who imagine that the profits of the syndicate are already very large." His calculation is:

Estimated Quantity of English and Foreign Copper Held by the French Syndicate.	
On September 1 (Chili Bars)...	50,000
(other Copper).....	50,000
On January 1.....	100,000
Increase in stock in eight months...	65,000
Total Import of Copper into England and France, Including Pyrites.	
January 1 to September 1.....	95,000
Gone into consumption.....	30,000
Estimated quantity of Copper delivered by other holders than the syndicate.....	10,000
Sold by the syndicate.....	20,000
	30,000
Cost of 100,000 Tons Copper held on September 1.	
50,000 tons Chili Bars, at.....	£71
25,000 tons taken over from Société des Métaux, January 1, at.....	64
25,000 tons since purchased, at average price of.....	78
	Per ton.
50,000 tons other copper, at contract price of 13/ per unit.....	£70 for best select.
Average price.....	77 for best select, 1st Jan. to 1st Sep.
Profit.....	£7

No Chili bars sold during this period to consumers.
Profit on 20,000 tons sold by the syndicate at £7 per ton..... 140,000
Interest on estimated average quantity held by syndicate during eight months—viz., 70,000 tons at £70 per ton, or £4,900,000 at 4 per cent. per annum for eight months..... 130,000
Present interest per annum on 100,000 tons, at £70 per ton, or £7,000,000, at 4 per cent. per annum..... 280,000
To this must be added brokerages, bank commission, rents, charges, &c.

In this connection reference may be made to a statement in the *Journal des Mines*, to the effect that a new contract has been entered into between the syndicate and Copper producers, to take effect on the expiry of the current three years' agreement. The terms of this new contract are thus set forth: "According to the arrangements at present in force the syndicate takes the production of the mines at a minimum of £62. 10/ per ton in the case of the Rio Tinto, of £64 for the Calumet and Hecla, of £65 for the Mason and Barry, and of £70 for the Tharsis and the Cape Copper Companies. Further, the syndicate pays the cost of storage, insurance, &c., and after receiving £5 per ton on account of its services shares all excess profits with the companies. According to the new combination the syndicate binds itself to take all the Copper produced by all the companies, at a uniform price of about £72. 10/ per ton. It further abandons its claim for £5 per ton in excess of the minimum price, and shares equally with the companies in the profits remaining after all expenses have been paid." It would thus appear that the syndicate in their efforts to maintain their position have been compelled to assume much heavier obligations than before.

Rio Tinto shares improved, at Paris, 51½ francs, there being quite a revival in Copper-mining share speculation over there.

Tin.—The fluctuations in the London market have been comparatively unimportant. From £108. 10/, spot, the price improved temporarily to £108. 17/, and is now £103. 15, after touching £108. 10/ yesterday. Futures gave way from £104 to £102. 15/ and are to-day £103. Jobbers have been getting 23½¢, and, in a speculative way, the price has ruled at 23.25¢ September, 23.20¢ @ 23.40¢ October and 23¢ November, but trifling lots changing hands, the general feeling being one of apathy. The Banca sale in Holland came off at 63 guilders per 50 piculs. During the first seven months there were shipped from the Straits Settlements to the United States 16,520 piculs of Tin, against the following amounts in preceding years: 1887, 46,858; 1886, 40,708; 1885, 16,471; 1884, 37,408, and 1883, 67,119; the import into the United States was simultaneously 19,386,874 lb, against 16,524,743 in 1887, while the re-export was 113,614 and 102,484 lb respectively. At the Metal Exchange 10 tons October Tin brought 28.45¢ to-day. **Tin Plates.**—There has been a fair demand for Plates, both spot and futures, although there is not much inducement now to buy the latter, as the present price approximates very closely to spot stocks. The advances noted in our last still hold. Liverpool is firm at 14/ for Cokes, makers being well booked for two months ahead. The import into the United States during the first seven months has been 388,521,775 lb, against 377,523,392 lb same time last year, while the re-export has respectively been 649,896 and 972,911. We quote at the close, large lines, per box: Siemens-Martin Steel, Charcoal finish, \$5.25 @ \$5.75; Coke finish, \$4.75; Terns, \$4.80 @ \$4.40; Bessemer Cokes, \$4.65, and Wasters, \$4.30.

Lead.—There changed hands on the Metal Exchange since our last report, altogether, 212 tons of Lead at 4.95¢ @ 5¢, both September and October. Consumers now and then buy a small lot and pay 5¢, which is the price to-day; yesterday they paid 5.05¢ for 50 tons of an extra brand. At Chicago and St. Louis the price has risen from 4.80¢ to 4.90¢. In London Soft Spanish improved from £14.7/6 to

£14.12/6, while English Pig rules at £14.17/6.

Spelter.—The demand here has been moderate at 5.10¢ @ 5.15¢ for near delivery and October, but Silesian, now worth £19 in London, cannot be had for less than 5.90¢.

Antimony.—Is quite strong at 12½¢ @ 13¢ for Cookson, and 10½¢ Hallett, the stock being light, and the demand good. London remains steady at £39 for the latter.

New York Metal Exchange.

The following sales are reported:

THURSDAY, September 20.	
25,000 lbs. Lake Copper, November.....	17.50¢
116 tons Lead, October.....	5.00¢
FRIDAY, September 21.	
50,000 lbs. Lake Copper, January.....	17.55¢
25,000 lbs. Lake Copper, January.....	17.50¢
SATURDAY, September 22.	
10 tons Tin, October.....	23.20¢
32 tons Lead, September.....	4.95¢
16 tons Lead, October.....	4.97½¢
MONDAY, September 24.	
10 tons Tin, November.....	23.00¢
TUESDAY, September 25.	
25,000 lbs. Copper, December.....	17.50¢
48 tons Lead, October.....	5.00¢
WEDNESDAY, September 26.	
10 tons Tin, October.....	23.45¢
10 tons Tin, October.....	23.40¢
16 tons Lead, October.....	5.02½¢

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]
LONDON, WEDNESDAY, Sept. 26, 1888.

There have been no important developments in the market for Copper or Block Tin. Both commodities are, apparently, in practically the same position that they were a week ago, and, apart from a sharp rise on Chili Bar prompts, due mainly to purchases for cornering "short" sales, the fluctuations of prices have been unimportant. The local stock of Tin is very moderate, and the available supply afloat is small as well. The opportunity is thus afforded for running prices up prior to the arrival of fresh supplies from the Straits, but as yet evidences are wanting of any contemplated movement in that direction. Speculation in Copper has been spiritless and consumers' purchases small, with outside brands substituted as far as practicable for Chili Bars.

The demand for Tin Plate, particularly from the American market, is checked more or less by the continued upward tendency of prices for all varieties. Makers are, however, so well supplied with orders that they accept new business only at their own prices. The report has circulation that prominent parties are negotiating for the erection of no less than four new works of considerable capacity.

Nearly all branches of the Steel trade continue active. Shipbuilding sorts and Rails figure most prominently, large orders having been placed the past week in both branches. Prices are very firm all through.

The Pig Iron market has displayed scarcely the degree of buoyancy that prevailed the preceding fortnight. Still, the amount of stock taken up by consumers and for export has been considerable and prices show scarcely any reaction from the highest point, except in the instance of warrants, which are a fraction off.

Scotch Pig.—There has been a fairly active trade in makers' Iron, and the market retains a firm tone:

No. 1 Coltness, f.o.b. Glasgow.....	51/
No. 1 Summerlee, " ".....	52/
No. 1 Gartsherrie, " ".....	48/6

No. 1 Langloan, " "	50/3
No. 1 Carnbroe, " "	44/
No. 1 Shotta, " at Leith.	49/
No. 1 Glengarnock, " Ardrossan.	47/
No. 1 Dalmellington, " "	43/6
No. 1 Eglinton, " "	42/6
Steamer freights, Glasgow to New York, 10/	
Liverpool to New York, 10/	

Cleveland Pig.—Business in this line not so large, but still of good total and at full prices. No. 1 Middlesboro', G.M.B., 37/6; No. 3 do., 35/.

Bessemer Pig.—The demand has continued brisk, and values remain firm. West Coast brands, mixed numbers, 45/9 @ 46/, f.o.b. shipping point.

Spiegeleisen.—Sellers are very firm and report a good demand. English 20 % quoted 77/8, f.o.b. N. W. England shipping point.

Steel Rails.—The market continues strong and active. Standard sections quoted at £4.1/3 @ £4. 2/8, f.o.b. at N. W. England shipping point.

Steel Blooms.—Demand is good and the market very firm. We quote £4 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—A fairly active business reported, with prices very firm. Bessemer, 2½ x 2½ inch, £4. 1/3, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—Demand somewhat better, but prices without change. Mild Steel No. 6 quoted at £5. 18/6 and No. 5 at £5. 17/, f.o.b. at N. W. England shipping point.

Steel Slabs.—A fair business passing, at firm prices. Bessemer, £4, f.o.b. at N. W. England shipping point.

Old Rails.—The market remains very firm, with demand fair. Tees quoted at £2. 17/6, and Double Heads £3, f.o.b.

Scrap Iron.—A moderate business, but prices firm. Heavy Wrought quoted at £2. 7/6 @ £2. 10/, f.o.b.

Crop Ends.—Demand runs fair and prices remain firm. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Manufactured Iron.—Business in all branches is still brisk, and prices are strong. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars....	£ s. d.	£ s. d.
Common " " " " " "	@ 7 12 6	
" " " " " " " "	@ 5 0 0	
" " " " " " " "	@ 7 0 0	
" " " " " " " "	@ 4 17 6	

Tin Plate.—There is still a good demand, but the high prices asked check business. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/8 @ 15/9
IC Bessemer steel, Coke finish.....	13/9 @ 14/
IC Siemens " " " " " " " "	14/ @ 14/8
IC Coke, B. V. grade.....	13/6 @ 13/9
Charcoal Terne, Dean grade.....	13/ @ 13/6

Tin.—The dealings moderate and prices irregular. Straits quoted at £108. 10/, spot, and £103 @ £108. 5/ for three months' futures.

Copper.—There is no material change in the condition of the market. Chili Bars, £95 @ £100, spot, and £78. 10/ @ £79, hree months' futures. Best Selected, £79.

Lead.—The market strong and fairly active. Soft Spanish, £14. 10/ @ £14. 12/6.

Spelter.—Transactions only fair, but prices firm. Silesian, ordinary, £18. 15/ @ £19.

Mr. J. F. Robinson, of the iron brokerage firm of Robinson & Orr, has returned from a brief trip to Europe. Mr. Orr made the trip in the summer of 1887.

BRAZIL.

PARA, September 21, 1888.—*India Rubber.*—In response to the advance in Fine at Liverpool to 35d, the market here exhibits great strength. The amount shipped to New York so far this month does not exceed 240 tons, by two steamers.—*Per cable direct.*

CHILI.

VALPARAISO, July 20, 1888.—*Copper.*—There has been some activity in three months' futures, 11,600 quintals being taken at \$29.45 @ \$29.60 per quintal, which equals £75. 5 11 per ton to England, with 27/6 steam freight. *Nitrate.*—In spite of the decline in Europe and America, makers have remained firm, getting \$2.70 for 95 % on the spot and \$2.75 @ \$2.77 1/2 futures, which is above foreign parity. Sales aggregate 227,000 quintals; \$2.70 equals 8/3 1/2 in England with 28/9 freight. The June shipments amounted to 794,534 quintals.

Shipments During the First Six Months:

	1888. Quin- tals.	1887. Quin- tals.	1886. Quin- tals.
To Northern Europe.....	4,930,680	4,081,205	2,547,518
To the Medi- terranean....	103,334	156,538	92,312
To the United States on the Atlantic.....	826,268	976,928	944,264
To the United States on the Pacific.....	90,938	142,296	118,069
Totals.....	5,951,220	5,306,962	3,702,163

The fortnight's charters have been 29,200 tons for Europe. *Coal.*—The last two days Coal on the spot, has dropped from 56/ for New Castle to 46/. *Afloats* are also lower, May sail being quoted 40/, and June, 37/; Australian July sail, 37/. *Exchange*, 90 days' bank bills, 26d.—*Weber & Co.*

EAST INDIES.

SINGAPORE, August 3, 1888.—*Tin.*—Receded during the week to \$33.50 per picul, but subsequently recovered to \$34.50, in order to close at \$34.25. During the first seven months there have been shipped to England 94,256 piculs, against 32,401 during the corresponding period of last year, and 33,917 in 1886; to the Continent, respectively, 9129, 18,880 and 15,691, and to the United States, 15,907, against 34,654 and 22,695. *Gum Damar* has sold in a small way at \$14 per picul Siam, and \$21 fair Palembang. *Gutta Percha* is scarce, and wanted at a slight improvement. We quote Prime, \$90 @ \$110; Medium, \$50 @ \$75, and White, \$17 @ \$40 per picul. *Exchange* on London, four months' bank, 3/0 1/2.—*Giffillan, Wood & Co.*

SINGAPORE, September 19, 1888.—*Tin.*—During the first half of the month there have been shipped from the Straits Settlements to the United States 400 tons, against same time last year, 200; since January 1, 1880, against 3750; to England, September 1 to 15, 800, against 400; January 1 to September 15, 13,200, against 9200.—*Giffillan, Wood & Co., per cable to Charles Nordhaus, 89 Water street, New York.*

MANILA, September 17, 1888.—*Hemp.*—Our market has been quiet at \$9.87 1/2, against same date last year \$10, equaling per ton, cost and freight, £32. 17/6, against £35. 17/3. Since our last cable there have been no clearances for the United States; since January they amount to 125,000 bales, against 150,000 last year, and there are still loading 50,000, against 50,000 in 1887. Clearances for England since January 1 aggregate 246,000 bales, against 156,000 in 1887; there remain loading 8000, against none; cleared for all other ports 53,000, against 30,000; receipts at all ports since last cable, 12,000, against 10,000; ditto, since January 1, 439,000 bales, against 354,000 last year, and 289,000 in 1886. *Freight*, \$6, against \$5.50. *Exchange*, 3/5 1/2, against 3/9.—*Ker & Co. to Charles Nordhaus, New York, per cable.*

ITALY.

GENOA.—September 12, 1888.—*Hardware.*—The import of Hardware and Brass Goods into Italy is chiefly, nay, almost exclusively, from Germany. *Agricultural Machinery and Implements.*—We import from England owing to the credit system which has been introduced in this branch, enabling the landed proprietor

to pay for the machines in installments spread over three years. *Machinery for Manufacturing Purposes.*—We receive from France, because it combines good qualities with cheapness. *Smaller Machines.*—Germany supplies, because they are cheap on the one hand, and they can be sold on credit on the other. *Sewing Machines.*—We import from Vienna. *In Fire Arms.*—Belgium, Germany, Austria and France all compete for the Italian trade. Belgium sells, however, by far the bulk, owing to good quality combined with cheapness.—*La Patria.*

HOLLAND.

ROTTERDAM, September 12, 1888.—*Tin.*—The Tin movement in Holland in August has been as follows:

	Banca. 1888. July 31.	1888. Aug. 31.	1887. Aug. 31.
Stock on warrants in Company's hands, slabs.....	31,854	20,108	15,871

Since the beginning of the month Banca has advanced to 63 for spot and September sale, and Billiton to 61.50 guilders.—*Koch & Vlierboom.*

GERMANY.

HAMBURG, September 15, 1888.—*Iron.*—The Rhenish-Westphalian Iron market has, on the whole, been dull and unaltered during the week. Spiegel is quoted at 53 marks per ton for 10 % @ 12 % Manganese. It is stated there is a good demand in England for American account for high grade Spiegel and it is hoped that American purchases may also increase in Westphalia. Forge Pig has been firmer at Siegen and sales to the close of the year are reported. Bessemer is neglected; Thomas in request. A larger output of Foundry Pig has been absorbed without difficulty. English Bessemer is bringing 45. Finished Iron sells tolerably well for domestic consumption, but the export trade is still slack therein; this is a weak point. Structural continues doing very well. The activity in Boiler Plates is as great as ever; the price of 170 marks for 5.5 mm. is currently paid, and 150 for Tank Plates. Thin Sheets are looking up. Machine shops, foundries and car works are all busily and remuneratively engaged to the extent of their capacity. The International Steel-Rail syndicate is in a fair way of resuscitation. During the first seven months Germany shipped 71,331 tons of Steel Rails, against 98,900 last year, and England, 597,429, against 556,915. The chief shipments made from both countries were distributed as follows:

	From Germany. 1888. tons.	1887. tons.	From England. 1888. tons.	1887. tons.
To Russia.....	74	52	3,017	8,548
To Scandinavia.....	886	1,184	13,075	20,677
To Spain.....	264	608	8,383	5,107
To Italy.....	845	5,404	2,017	12,015
To Japan.....	1,030		37,562	7,726
To the United States.....	2,270	10,396	39,723	92,941
To Mexico.....			11,049	4,811
To the Argen- tine Republic.....	4,715	1,125	140,088	37,555
To British India.....			183,499	187,244
To Australia....	5,129	9,647	48,677	65,366
Totals.....	14,183	29,448	487,090	441,989

Germany's Steel Rail exportation has, according to the foregoing figures, dwindled down to a comparatively unimportant amount. It is desirable, therefore, to have the syndicate renewed. After this question is solved the one of the price which the Prussian Government railroads are to pay in the future for Steel Rails will have to be considered. *Metals.*—It is asserted that the Spanish Lead mines are ready to join the proposed European convention of producers, the plans for which were laid down at Paris, on June 29 last, but this piece of news still lacks confirmation. Lead is rising and all Metals are firm.—*Borsenhalle.*

Hardware.

Trade continues in fair volume and without special features of importance. The effect of the yellow fever is being felt in Southern trade, and the result will doubtless be a temporary curtailment of business in that section. Prices remain unchanged except in a few cases.

Barb Wire.

The New York Barb-Wire market has the same general features as were indicated in our last report, but instead of the nominal prices then prevailing lower quotations are now openly made. The understanding between the Eastern manufacturers, by which prices were so satisfactorily maintained last season, having terminated, the manufacturers are now in an open market, and this fact will probably have its influence in the direction of lower prices than have prevailed the past season. The present price may be quoted as 3.6 cents to 3.75 cents for Four-Point Galvanized, with only a moderate business. With the concessions that might be obtained for a large order, it is thought by some well-advised parties that Barb Wire would be a safe purchase.

Cut Nails.

There has been no change in the volume of the business being done, or in the tone of the market, quotations remaining \$1.85 to \$1.90 for carload lots, and \$1.90 to \$2 for small lots from store. Little confidence is felt here in the ability of the Western makers to organize the proposed pool.

Wire Nails.

The factories are reported to be generally well supplied with orders, and but little complaint is made of irregularities in price. The fact that a leading Western company is not associated with the other manufacturers in the arrangement for the control of prices does not appear to have any influence in breaking the market, as the company in question are understood to be maintaining prices on the basis agreed upon by the other manufacturers.

Miscellaneous Prices.

The Victor Mfg. Company, Newburyport, Mass., issued a circular relating to the Victor Elastic Cement, which is used for bedding slate, pointing up and preventing leaks in metallic roofs, around chimneys, Copings, Skylights, Gutters, &c. It is described as adhering to all substances, not cracking or peeling off, never becoming brittle, but remaining elastic, hardening into a leather like substance, very durable. It is claimed that Tin, Shingle and Slate roofs can be made permanently water-tight by means of it. The company offer it as a desirable addition to the line handled by Hardware merchants, as well as Lumber Dealers and Dealers in Paints and Building Materials. It is sold at the following prices:

2½ pound cans, per pound.....	5½ cents.
5 pound cans, per pound.....	5 cents.
Tubs, 20 to 125 pounds, per cwt.....	\$4.50
Barrels, per cwt.....	4.50

Besides the prices on Apple Parers which are given in another column, the New Scott Mfg. Co., Baltimore, Md., announce the following quotations on goods of their manufacture:

Hopper Cherry Seeder, per dozen.....	\$3
Melting Ladles, per dozen.....	5 6
1 2 3 4 5 6	
\$1.40 2.00 9.00 12.00 14.40 16.00	
Arctic Ice Creepers, per gross.....	\$24
Safety Ice Creepers, per gross.....	15
The following goods are listed as named, and subject to a discount of 20 per cent.:	
Deacon Can Opener:	
Japanned, per gross.....	\$36.00
Nickel, per gross.....	60.00
Coppered, per gross.....	36.00
New Idea Can Opener, per gross.....	15.00
Rotary Can Opener, per gross.....	20.00
Universal Can Opener, per gross.....	20.00

Fruit Press:	
2 quart, per dozen.....	2.25
4 quart, per dozen.....	3.00
Mammoth Egg Beater, per dozen.....	50.00
Medallion Egg Beater:	
Regular, per gross.....	12.00
Medium, per gross.....	15.00
Victoria Egg Beater, per gross.....	12.00
Diamond Vegetable Grater, per gross.....	5.00
Cyclone Dish Traps, per gross.....	4.00
Peach Pitting Spoon:	
Milled, per gross.....	36.00
Regular Ground, per gross.....	24.00

The Axe manufacturers have been in session, but no action in the matter of prices is reported.

A slight advance has been made in the price of Trace and Fancy Chains, the lowest prices made having been withdrawn. Coil Chain is also held with firmness, without quotable change.

There has been a decline of ¼ cent per pound in the price of Sisal Rope, which is now quoted at the following prices for large lots, with a discount of 1½ per cent. for cash in 10 days:

	per pound.
Sisal, ½ inch and larger.....	9½¢
Sisal, ¾ inch.....	10 ¢
Sisal, 1 and 5-16 inch.....	10½¢
Sisal, Hay Rope.....	9½¢
Sisal, Tarred Rope.....	9 ¢
Sisal, Medium Lath Yarn.....	8½¢

This reduction of price has been made owing to competition among the manufacturers, notwithstanding the fact that Hemp continues scarce and the factories are generally well supplied with orders. Manila Rope continues firm.

The National Association of Spring Manufacturers met last week in Cincinnati, there being a fair representation of the manufacturers. The business transacted was principally of a routine character. E. H. Bourne, of Cleveland, president, and G. S. Smith, Fort Plain, N. Y., acted as secretary.

Apple Parers.

There is comparatively little new in this line, the Parers put on the market being substantially the same as last year, with a few improvements. We give below the names of the machines of the different makers, and the prices at which they are sold:

L. A. Sayre, Newark, N. J., makes the following quotations on Parers of his manufacture:

	Per dozen.
Monarch Peach and Apple Parer.....	\$13.50
Waverly Apple Parer.....	4.50
Ideal Apple Parer, Corer and Slicer.....	4.75

C. E. Hudson, Leominster, Mass., is putting on the market this season the following Apple Parers, which are quoted at the prices named:

	Per dozen.
Rocking Table.....	\$4.00
Little Star Parer, Corer and Slicer.....	5.00
Hudson's New '88 Parer, Corer and Slicer.....	3.75

Since last season an improvement has been made in the Little Star Parer, by which the slicing knife is made stronger, thus, it is claimed, materially improving the machine, as it is less liable to break or get out of order.

The Reading Hardware Company, Reading, Pa., and 81 Reade street, New York, manufacture the following Apple Parers, which are sold at the prices named:

72 Baldwin.....	\$4.25
73 Baldwin.....	5.25
74 Gem.....	5.25
75 Gem.....	5.75
76 Gem.....	5.75
77 Champion.....	6.50
78 Champion.....	7.75
Advance.....	4.75

The New Scott Mfg. Company, Baltimore, Md., quote the following prices on their line of Parers:

Rotary Family Peach Parer, per dozen.....	\$13.50
Mammoth Peach Parer, ".....	6.75
Orion Parer, Corer and Slicer, ".....	4.00
Victor Parer, Corer and Slicer, ".....	13.50
Gold Medal Parer, ".....	4.00

The Penn Hardware Company, Reading, Pa., as mentioned in our report last week, are making the following machines:

	Per doz.
Penn Apple Parer, Corer and Slicer.....	\$4.00
Perfection Apple Parer, Corer and Slicer.....	4.00

The Goodell Company, Antrim, N. H., make the following Parers, which are quoted as below:

Pomona, per doz.....	\$4.00
Turntable, per doz.....	4.50
New Lightning, per doz.....	5.50
White Mountain Potato Parer, per doz.....	4.50
White Mountain Apple Parer, Coring and Slicing Machine, per doz.....	4.50
Antrim Combination Apple Parer, Corer and Slicer and Potato Parer, per doz.....	5.50
Family Bay State Apple Parer, Coring and Slicing Machine, per doz.....	12.00
Improved Bay State Apple Parer, Coring and Slicing Machine, per doz.....	30.00
Eureka 1888 Hand or Power Parer, Coring and Slicing Machine, each.....	17.00

The last-named machine is the Eureka 1886, changed and improved somewhat in construction, and called the Eureka 1888.

In addition to the above machines the Henry C. Hart Mfg Company, Detroit, Mich., make the Standard Apple Parer, which has been on the market for several years.

D. H. Whittemore, who can be addressed care Occidental Hotel, New York, advises us that he is making a large or mammoth Champion for use in evaporating factories, hotels, &c., which is sold at \$6, subject to a discount of 25 per cent.

Items.

We understand that no sale has yet been made of the factory and business of William A. Ives & Co., Hamden, Conn., which are offered for sale by the executors of Mr. Ives, as per announcement on page 47. In view of the fact that this business is long established and well known the opportunity thus offered to manufacturers desiring to carry on the enterprise is referred to as one deserving their favorable consideration.

Holmes & Edwards Silver Company, Bridgeport, Conn., allude to the success of their Mexican Silver Flatware, which they put on the market about three years ago to meet the demand for a line of unplated goods of superior quality, and state that trade has steadily increased on this better grade, while the demand for Silver Metal has also been continued, there being a market for both grades.

The Morley Respirator Company, East Saginaw, Mich., refer to the utility of their Respirator for use in blacking Stoves and have received a letter from a merchant, in which it is highly commended for this use.

The Underhill Edge Tool Company, Nashua, N. H., for whom Sise, Gibson & Co. are agents, 100 Chamber street, New York, have issued a new catalogue of their goods, which represents their well-known list of Axes and Hatchets, Washoe Picks and Mattocks, Bush Hooks, &c., illustrations being given of the different goods, with list prices.

Thomas Devlin & Co., Philadelphia, Pa., have issued a new price list and illustrated catalogue, in which their line of Butts, Hinges, Latches, Hooks, Brackets, Carriage and Harness Hardware and other manufactures are represented.

By the announcement on page 47, it will be seen that the Commercial Exchange, Des Moines, Iowa, are making efforts to secure the establishment of factories in their city, and allude to the advantages of the location. Some particulars are given which are worthy of consideration.

The trade will observe a Special Notice on page 48, in which a Hardwareman announces his desire for a position in a manufacturing, jobbing or commission Hardware business, and alludes to his experience in office, factory and on the road. His extensive acquaintance with the jobbing trade East and West is also referred to.

Bradlee & Co., Philadelphia, Pa., issue a circular in regard to the care and use of Chain, giving valuable suggestions and

tomers who were enjoying the festivities of the city were suddenly called home to prevent being kept out by quarantines. Except for this great calamity trade is excellent, and the larger jobbers, who are already behind in filling orders, are adding to their forces of traveling men. Bar Iron is in good demand from the mills, which ought to put them in fair shape. As a fact, they have no reason to complain, as they get all material at very low prices. Cut Nails are quiet, the pool not having materialized as yet, but more firmness is maintained. Wire Nails pursue the even tenor of their way, not being disturbed, but firmly held at full prices. Some jobbers simply to hold certain trade are selling at below mills' prices; this will soon be evened up. Barded Wire is now considered good property at last low figures, the dealers expecting another advance because the mills say so, but not seeing why there should be at the end of the season, and all the mills running. The demand from store is good.

Principles Applied to the Protection of Trade-Marks.

We reported in a late issue the case of the Russia Cement Company against William N. LePage, in which it was decided that "LePage's Liquid Glue" passed under an assignment which Mr. LePage (as a member of a copartnership) made in 1882 to the Russia Cement Company of the right to use the trade-marks belonging to or in use by said copartnership at that time. The defendant contended that "LePage," being his own name, was not a trade mark, and that in fact he had never assigned his name. He claimed that the name was only a subordinate part of the trade-mark labels attached to the goods, and since these labels had not been in the least imitated, he had a right to use the descriptive phrase "LePage's Liquid Glue," which, in fact it was, to describe his goods. The court said no; but in order that it might not be misunderstood, it added: "While the plaintiff has not sought to prevent the defendant from manufacturing Glue, in order to avoid misunderstanding we add that while the defendant cannot use the words adopted as a trade-name for the article manufactured by him, we do not decide that he may not use the words 'Liquid Glue,' or other appropriate words to describe his product, or to state in that connection that he is himself the manufacturer of it."

The corporation with which Mr. LePage is connected, and which had done business as the "LePage's Liquid Glue and Cement Company," at once changed its name to "The LePage Glue and Cement Company," and changed its labels to read "W. N. LePage's Improved Process Family Glue," because Mr. LePage had obtained a patent for an improved process of making the Glue. They thought that if Mr. LePage could say that he was the manufacturer he could as well say, "Wm. N. LePage's" as "manufactured by Wm. N. LePage." Both phrases certainly indicate that the Glue is Wm. N. LePage's Glue. The Russia Cement Company objected, however, to the change and brought suit against the company (which was brought to trial September 21, at Boston), saying that the company was bound by the former decision against LePage, and that he was not entitled to use this particular collocation of words, viz., William N. LePage's Family Glue.

The court in this last suit said that the defendant could say Liquid Glue manufactured by William N. LePage, or Liquid Glue manufactured by the company, but that they could not say William N. LePage's Liquid Glue.

This decision is of great importance to manufacturers who use their own names in the possessive case. It was not formerly thought that such names were good trade marks—e. g., it was said by Judge Gray, now of the Supreme Court of the United States, while a Massachusetts judge (Gilman vs. Hunnewell, 122 Mass.), that "Hunnewell's Pills" was not a trade-

Trade.

From Louisville our advices under date September 22 are to the following effect:

The Hardware trade of Louisville, Ky., is subject just now to one great disturbing factor. The yellow fever scourge has almost brought business to a standstill in certain sections of several states. Various reports are made by the different dealers, depending on just what trade they reach for, some saying that trade is good, and others giving instances of large orders being canceled. Many cus-

mark. In many other cases the same idea has been expressed. The same court now seems to have changed its position. The labels of these rival manufacturers of Glue have been shown in their advertisements in this paper and merit comparison. No damages were asked against the LePage Glue and Cement Company, and none were awarded. The company has appealed, and the de-

shelves at the top for full packages and pigeon-holes for Malleable Iron Castings. These pigeon-holes consist of three tiers, each pigeon-hole being 9 x 12 inches in the clear, with a 3-inch piece along the front. The upper drawers are about 5 inches square and the bottom ones 9 inches square. The large drawers are divided crossways by a partition. On the counter in front Horse Nails, Nuts, Rivets, Sad Irons and

roll of Belting has a frame made of 1-inch stuff, with a maple roller with an iron pin through it for the Belt to turn on. One of these frames, it will be observed, is shown separate from the rack. These frames fit in the rack, which is made of 2-inch stuff, and are fastened in by hinged strips across the top and bottom of each section. In the basement Nails, Horseshoes, Barbed Wire, Oils, &c., are stored. The

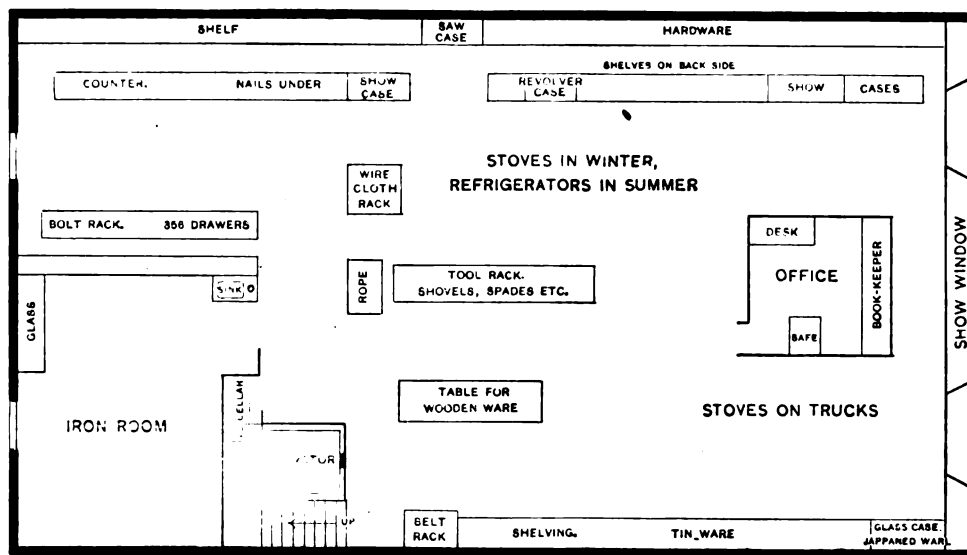

Fig. 270.—Store of Stebbins & Co., Rochester, Minn.

cision of the highest court of the State will be awaited with much interest.

Arrangement of Stores.

Stebbins & Co., Rochester, Minn., furnish us with material for a description of their store, the general arrangement of which is shown in Fig. 270. The office

Seat Springs are accommodated, with Barn-Door Hangers underneath. Their Tool rack, Fig. 272, is stationary, with a shelf high enough to stand Shovels, Spades and D-Handled Forks under and Long-Handled Forks and Shovels on the shelf. This rack is built permanently between two posts in the middle of the store and is very satisfactory. It is about 10 feet long. Both sides are utilized. Five dozen Stove Trucks are used in displaying Stoves, so that each Stove has a truck, permitting it to be moved where it will show to the best advantage. Bird Cages, Sleigh Bells, Coal Hods and numerous other bulky articles are hung on rods suspended from the ceiling. Fig. 273 shows the shelving devoted to Wire Cloth. It is a movable rack of shelves 3½ feet long and 6 feet high, the shelves being far enough apart to admit a roll of Cloth. Next to this, Fig. 274, they have another movable rack of shelves of pigeon-holes for Axe and

tin shop is on the second floor, and runs across the rear. The balance of the second story is used for storage. The arrangements for supplying the building with water, and the methods adopted for

Fig. 271.—Bolt Rack.

occupies, it will be seen, a prominent position in the front of the store, and is referred to as giving a view of the customers as they enter and of what is going on in the store. It is enclosed as high as the standing desk, with a wire railing on top. The elevator is boxed in and is so located that comparatively little space is occupied by it, the stairs going round it, as indicated. Their Bolt rack, Fig. 271, is alluded to as one of the best. There are drawers for 356 sizes of Bolts, with

Fig. 272.—Shovel and Fork Rack.

Pick Handles, Hay Knives and Whiffletrees, both ironed and in the rough. Their method of accommodating Belting is shown in Fig. 275. This rack is the same height as the shelving, and stands out from the wall, as shown in the cut, with iron braces by which it is steadied. This rack accommodates three tiers of Belting. Each

Fig. 273.—Wire Cloth Rack.

keeping it, are also deserving of mention. There is a cistern with force pump and sink behind the door in the Ironroom, and by this water is forced into the tin shop for the sink there. There is also a warehouse 24 x 60 feet for Wagon Stock, and 150 feet of open sheds for Hardwood Lumber, thus giving, it will be observed, together with the Ironroom in the rear of the main store, a complete and convenient arrangement for the business of this enterprising house. A large coal stove is used in the store in cold weather, the tin shop being heated with a furnace in the rear of basement, connected with which is a register in the store, which is sufficient for fall and spring requirements. The smoke-pipe from the furnace runs the whole length of the basement, and is jacketed, with a register from the jacket into the office. Thus, with the furnace, it is pointed out, the shop, basement and office are heated, while it is of use also in

heating the store when necessary. The Oils are kept near the furnace, and thus run freely all winter. The further advantage of this arrangement is that their tinners have no fire to build or look after, no wash water to carry, and no excuse for not attending to business.

The Art of Selling Goods.

By KNARF.

Why we are in the habit of treating persons we are brought in contact with so differently from the treatment we would like to receive ourselves, or the treatment we know would be the most persuasive with us, is an unknown quantity. We say things to them which we expect will produce the results we desire, to make them think as we wish them to

Fig. 274.—Rack for Axe and Pick Handles, Hay Knives, &c.

and see things as we wish them to be seen by them. We know the same things said to us would have an opposite effect, even to making us angry. To deal with people successfully we must be a judge of human nature, and the better judge we are the more successful will we be in our dealings.

Selling goods is a faculty, whether natural or acquired. Some people are good salesmen, others never can be. To dicker is natural to some nations as nations. Yankees have the reputation of being the keenest dealers we have. Get acquainted with your customers and then you will know how to take them. The early drummers were, as a rule, the more successful according to the stock and raciness of their stories, but with the increase of the species, frequency of their visits, rush and competition of business, this accomplishment has fallen into disuse; it does not produce the required results. After a thorough acquaintance with the peculiarities of the person you have to deal with, a knowledge of the goods is indispensable. Their uses, strength and desirable qualities, the purposes for which they are used, can be explained, especially if there is any hesitation on the part of the buyer. The customer will be interested in the purchase very much in proportion as the salesman is. To lay down the article called for on the counter for the customer to examine and employ yourself looking out of the door and whistling will invariably lose you the sale. It will not do, however, to go to the other extreme and be too officious, telling the customers you know it is what they want when they are of the opinion it will not suit. Very few people will stand this.

While it is not well to confuse them by showing too great a variety of the same article, a disposition to sell them what they will afterward consider the best value for their money will be apt to make

them buy of you again. An article which suits them after they get home and answers the purpose required, leaves in their mind a favorable impression of the stock and place of business. Never be so smart as to get ahead of your customer; you will be the loser in the end. It is as a rule better to make a concession than to lose a customer, and to do it in a pleasant manner. There are chronic kickers whom no one can please. While retaining a customer, it is well always to have in mind that you, the salesman, are on the inside of the counter and the one you are dealing with on the other side; that you have the advantage of knowing the cost of the article and the regular selling price. Also that the customer has come in unsolicited to buy, and expects to pay your price if it can be bought for no less.

Confidence in your mode of doing business is created in the purchaser's mind if he realizes you are firm in your price and believe the article is worth what you ask for it. Don't lose your grip and be afraid to ask what you consider a fair price for the goods—it is demoralizing. A firm, courteous refusal to cut the price will seldom lose you a sale. Telling a customer the cost of an article does not often help the matter, as there is always a doubt in his mind as to the truth of your statement. Competition is so great that many resort to selling goods almost at cost to close customers, intending to make the profits from those who are not so well posted or so close in their dealings. In fact, honest, equitable dealing between salesman and purchaser is

Fig. 275.—Belting Rack.

becoming rare, however much the fact is to be regretted. Short weights or measure, deception in quality or direct falsehood, are too often the rule. While such dealing usually insures short life to the firm practicing it, for the time being it is an injury to the trade.

When unemployed the position of the salesman should be on his feet and near the door. A customer does not like to walk the length of the store to hunt for a salesman—we use the word hunt advisedly—nor should he be expected to. Being near the entrance, your visitor can be taken by the hand, with some commonplace remark about weather, or self or family, and as soon as you see he is ready for business make it easy for him by inquiring what you can show or sell. An abrupt "What will you have," as soon as you have

set eyes on each other, is not pleasant for your customer; it usually comes in anything but a pleasant tone of voice when shot at him in this way. Now that you have him at your mercy exercise your judgment, and treat him as his disposition requires. After you have sold what he asked for do not let him leave the store without the stereotyped question "Will that be all?" In most cases it will recall something he has forgotten, and thus increase the sales. That is what you are there for, do not forget that. Use all legitimate means to sell each one all you can. When he leaves the store, send him away with a "Thank you," "call again," or some benediction. He must not entertain the feeling you care only for what you have got out of him. Have him carry a good impression away, that, coupled with the pleasant reception and fair dealing, will tend to make that store a popular place to trade, not only for him but his friends. This idea of friends of well-treated and satisfied customers extends to a greater distance than we are apt to think.

It is a poor plan to begin waiting on one customer and leaving him to wait on another. The temptation may be great to hold both when help is short, but it is unsatisfactory to the two customers and yourself. If a party comes in merely to price goods or get information, take time to chat when the desired information has been given; he will find you pleasant and favor you with his trade when he needs anything in your line.

It is poor economy to have a poorly lighted store, or a cold one in winter. Try and have it warm, even in front by the door—it will cause customers to linger. We don't mean loaf, for you haven't any room for loafers. But a warm room is conducive to trade, and a cold, uncomfortable one is not. There are certain people whom you dislike, and one is apt to show it, unconsciously it may be, in your dealings with them. Particular care should be taken to be especially polite and courteous, and thus any dislike may be covered. Their dollars are as good as any one's.

Care must be taken to have the goods clean, and shown in an attractive, orderly manner. A show-window full of dead flies, goods piled in indiscriminately, Fly-Traps and Foot-Warmers, Tin Fruit Cans and Stove Boards, does not show attention to business. A show-case arranged in much the same manner does not show the goods. A stock kept up in assortment will fill the wants of your trade much better than a broken stock, or than the same amount of money put largely in a few articles. If people come to your place of business frequently and find you out of goods you are supposed to keep, they receive the impression that your stock is run down or incomplete and will trade elsewhere. These few hints will awaken in the mind of the reader other improvements in method of conducting his business which will be helpful, or at least these suggestions can be adapted to his local needs.

The *Master Mechanic* in a recent issue very appropriately says: "While there is a general call for a class of engineers who will control their engines by means of the reverse lever, is it not well to ask why some one does not call in a still louder voice for a class of locomotive builders who will put more notches in the quadrants? It is safe to say that, while locomotives have only one-third of the notches in the quadrant that it is possible to easily put there, engineers will use the throttle as a governor, if for no other reason than that they are more or less compelled to do so if the regulation is to be at all even. It is difficult to make an intelligent engineer comprehend the importance of following a method which is allowed to appear to be unworthy of the small outlay for a few notches

Improvement in Locks.

The Nashua Lock Co., Nashua, N. H., of whom C. F. Guyon & Co., 99 Reade street, New York, are agents, are calling attention to improvements which they have recently made in their line of locks. Among these they refer to the Nashua N. system of attaching spindles or knobs for

ing the knob, as is liable to be done with the old-fashioned swivel spindle knobs. It is also to be noticed that locks supplied with this patent swivel-spindle hub are made reversible by turning over the latch bolt and both parts of the hub, and, the hub being made to fit $\frac{5}{8}$ -inch spindles, enables the dealer to trim to suit his customers with any size of knobs he carries

its use will be understood as fastening the sashes and preventing them from rattling. The fastener consists of a bolt with a rubber end, such bolt being operated by a lever attached to a cam, thus giving the desired pressure with comparatively little power, easily applied. This simple device is so efficient in operation that it is described by the manufacturers as fastening windows securely so that they cannot be moved without releasing the pressure of the bolt. The rubber end is screwed on instead of being one solid piece, making the fastener adjustable, so that the bolt can be lengthened by slightly unscrewing the rubber end. This fastener is made in bronze, nickel-plate and brass. Its simplicity, efficiency of operation, durability, strength and neatness of appearance, as well as the ease with which it is applied, are the points which are

Fig. 1.—Nashua N. System of Knobs.

use with roses only, or rose escutcheon combined; Nashua new steel swivel spindles, and reversible spindle hubs; reversible anti-friction latch, and K system of night work adjustment. We illustrate below two of these specialties. In addition to the customary methods of attaching knobs to spindles the company have perfected and applied for a patent on a plan of their own, which they designate as the N system. In this system the knobs are made with longer shanks than usual and are $\frac{1}{4}$ -inch diameter, so as to go through the rose or rose and escutcheon combined, and rest on each side of the lock case. One knob being riveted to the spindle is intended to be used on the outside of the door. The other knob is fastened by a screw which goes through one side of the shank and through the spindle and is secured firmly by a thread cut in the other side of the shank. The N system is illustrated in the accompanying cut, Fig. 1. The N system of knobs for inside doors have $\frac{1}{4}$ -inch straight spindles, while those designed for outside doors have $\frac{5}{8}$ -inch swivel spindles, which are described as made so that they will work equally well in a solid hub. Among the advantages claimed for the N system are the following: That pulling on the knob made in this way has no tendency to separate or open the lock; that as one knob is always riveted to the spindle, such knob can always be on the outside and would preclude its being taken off and possibly the lock opened; that the N knobs can be kept in place without the least dependence on the roses, thus lessening the friction between knobs, shanks and roses, and enabling one to use roses only with equal advantage as rose and escutcheon combined, and that as the knob screws go entirely through one side of the shank and into the opposite side of the shank they will under no circumstances work loose.

Fig. 2 represents the new steel swivel spindle, $\frac{5}{8}$ inch, with reversible hub, which the company offer as an important improvement in front-door locks. The pin is to prevent any clandestine opening of the door from the outside by pushing the spindle through the hub after remov-

ing the knob. This is regarded as a feature of considerable importance, tending as it does to make an ordinary stock of locks and knobs more than usually available. Any of the company's knobs can be furnished with this new spindle.

Post's Window Fastener.

The accompanying illustration represents a simple and efficient device which

made in regard to it. The low price at which it can be offered is also referred to.

A large iron reservoir is to go up in Malden, Mass. The city has made a contract with the Cunningham Iron Works Company, of Boston, for the sum of \$20,940, to build a wrought-iron reservoir to contain 1,158,000 gallons of water. It will be 75 feet in diameter and 35 feet high, and built of plate iron $\frac{1}{4}$ inch in

Fig. 2.—Steel Swivel Spindle $\frac{5}{8}$ Inch, with Reversible Hub.

Post's Window Fastener.

has been patented by A. J. Post, of E. L. Post & Co., 10 Peck Slip, New York, by whom it is manufactured and put on the market. It is represented in the cut as

attached to the top of the lower sash, and thickness and of a tensile strain of 50,000 pounds per square inch of section. This reservoir will contain 4344 tons of water when full, and is the largest iron reservoir on this continent.

Musical Pole Chime.

The illustration given below represents one of the new styles of Swiss Tuned Pole Chimes put on the market by the Chapman Mfg. Company, Meriden, Conn. It will be observed that the chime is so arranged that the bells are free from the shaft or pole, giving them a chance to retain the vibration. The cut represents a chime of seven bells, but the chimes are

An interesting feature of this machine is the feeder and the manner in which it operates, it being so constructed that the turning of the crank by means of the eccentric shown moves the feeder in and out, thus forcing into the cutting screw such meat or other substance as is to be operated upon by the machine. The form and construction of the cone are also specially alluded to as embodying new features, in connection with which there

more than \$5,000,000. This is accounted for to some extent also by the decrease in the imports of petroleum. The exports to the United States were valued in 1886 at 11,928,404 taels and in 1887 at 11,545,406 taels. The total trade with the United States was 14,677,487 taels in 1886 and 12,314,310 taels in 1887. Thus it will be seen that our exports to China are falling off, while our imports from that country remain substantially unchanged. The

Swiss Tuned Pole Chime.

made with three or four bells for a single horse on the same principle. The chimes are described as finished in nickel, gold, silver or brass plated, and attuned to the chord of E, and as having a melodious and resonant sound which is very pleasing.

The Crown Meat Cutter.

The illustrations given below represent a new meat cutter, which is being put on the market by the American Machine

Fig. 1.—The Crown Meat Cutter.

Company, Philadelphia, Pa., for whom John H. Graham & Co., 113 Chambers street, New York, are agents. Fig. 1 gives a general view of the machine in position for use, while Fig. 2 represents

Fig. 2.—Parts of the Crown Meat Cutter.

the parts of which the machine consists. From these illustrations it will be seen that the machine is attached to the table or other fixture by means of clamps, and that the essential parts of the machine are the hopper frame with feeder, the cutting screw, the cone and the crank.

are important advantages. The following instructions for operating the machine will further indicate its special features.

For operation, fasten frame firmly to the table; see that the cone is screwed moderately tight upon the cutting screw, then drop catch in notch to hold it there; the cam part of the crank must lay in the notch of the feeder, and the thumbscrew holds crank in its place on the screw shaft. Drop pieces to be cut, one after the other, in the hopper, and by the turning of the crank these will be pushed forward by the feeder, so that the heel of the screw will catch and force them forward in the cone, where they will be cut between the sharp edges of the revolving screw and those of the stationary oblique knives in the cone (as between the blades of a pair of scissors) and finally be reduced to a uniform size by a further cutting in passing through the holes at the end of the cone.

The manufacturers point out that the work of cutting is thus advantageously divided, and all the unnecessary friction and waste of power avoided. The desired degree of fineness is obtained by the use

balance of trade last year was slightly in our favor—about \$1,000,000—but the anti-Chinese agitation in this country may serve to prejudice the Chinese against buying our products, and as a result we may be deprived of a market in which for a number of years we have been making very fair headway.

A New Form of Cut Nail.

The accompanying illustration represents a new steel cut nail, of which at present the Calumet Iron and Steel Company, of Chicago, are the sole manufacturers. Its sides are parallel, it has a chisel point, and it is cut so light as to run about the same number to the pound as the wire nail. The manufacturers claim a number of advantages for this new form of nail over both the old style of cut nail and the wire nail. The old-style cut nail with a blunt point necessarily break

The "P. C. F." Nail.

of different grade cones, which are supplied with holes from $\frac{1}{4}$ -inch up to $\frac{3}{4}$ -inch diameter, the cone regularly furnished with the machine having $\frac{3}{4}$ -inch diameter. The manufacturers emphasize the point that the machine thus constructed has important advantages, and allude to it as capable of cutting efficiently and satisfactorily a large variety of substances, some of which cannot be as well managed in other machines. They state that it can be used with equal ease for fruits, meats, vegetables, crackers, &c., and refer to its strength and simplicity as important features in its construction.

China's Foreign Trade.—Some interesting figures concerning the foreign trade of China are supplied by Minister Denby. According to these, Chinese foreign commerce increased in value during 1887 to the very important extent of \$28,000,000, the customs revenue showing an increase of nearly \$6,500,000. The exports were greater by \$10,400,000 and the imports increased \$17,740,215. The decrease of trade with the United States is noteworthy, although we are not alone in this respect, for Mr. Denby says that at the 19 treaty ports the imports of English and American drills fell off from 416,699 pieces and 620,803 pieces, respectively, in 1886, to 288,511 pieces and 464,731 pieces, respectively, in 1887. The value of the imports from the United States in 1886 was 4,647,333 taels and in 1887 3,398,390 taels, a decrease of over 1,000,000 taels, or

the fiber of the wood into which it is driven, while the parallel chisel-pointed nail cuts, separates and deflects the fiber slightly downward compactly on the side of the nail, thus causing the wood to fit tightly about it, and excluding moisture to rot the wood, and in time loosen the nail. Being also rough, and of uniform width throughout its length, instead of smooth and wedge-shaped like the old style of cut nail, it naturally has greater holding power. Actual tests are reported by the manufacturers as showing 30 to 75 per cent. more holding power than the old cut nail, and 50 to 100 per cent. more than the wire nail, according to the character of the wood. The new nails are also claimed to drive in hard wood without bending, where the wire nail cannot be used without first boring holes. Being of about the same weight as wire nails, they commend themselves to those who desire light, strong nails at a lower price. They are sold at a slight advance above the price of the ordinary steel cut nail and are branded "P. C. F."

An alloy, the electrical resistance of which diminishes with increase of temperature, has recently been discovered by Mr. Edward Weston. It is composed of copper, manganese and nickel. Another alloy due to the same investigator, the resistance of which is practically independent of the temperature, consists of 70 parts of copper combined with 30 of ferromanganese.

CURRENT HARDWARE PRICES.

SEPTEMBER 26, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.
